END USER LICENSE AGREEMENT

The Ivanti product that is the subject of this technical documentation consists of (or is intended for use with) Ivanti software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://www.ivanti.com/company/legal/eula>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Preface

Document conventions

The document conventions describe text formatting conventions, command syntax conventions, and important notice formats used in Ivanti technical documentation.

Text formatting conventions

Text formatting conventions such as boldface, italic, or Courier font may be used in the flow of the text to highlight specific words or phrases.

Format	Description
bold text	Identifies command names
	Identifies keywords and operands
	Identifies the names of user-manipulated GUI elements
	Identifies text to enter at the GUI
<i>italic text</i>	Identifies emphasis
	Identifies variables
	Identifies document titles
Courier Font	Identifies command output
	Identifies command syntax examples

Command syntax conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic text</i>	Identifies a variable.
[]	Syntax components displayed within square brackets are optional.

Convention	Description
	Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Non-printing characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, member[member...].
\	Indicates a “soft” line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.
bold text	Identifies command names, keywords, and command options.

Code Block

Following is an example of Python based code block in the html documentation:

```
def some_function():
    interesting = False
    print 'This line is highlighted.'
    print 'This one is not...'
    print '...but this one is.'
```

Notes and Warnings

Note, Attention, and Caution statements might be used in this document.

A Note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

An Attention statement indicates a stronger note, for example, to alert you when traffic might be interrupted or the device might reboot.

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

Revision History

The following table lists the revision history for this document:

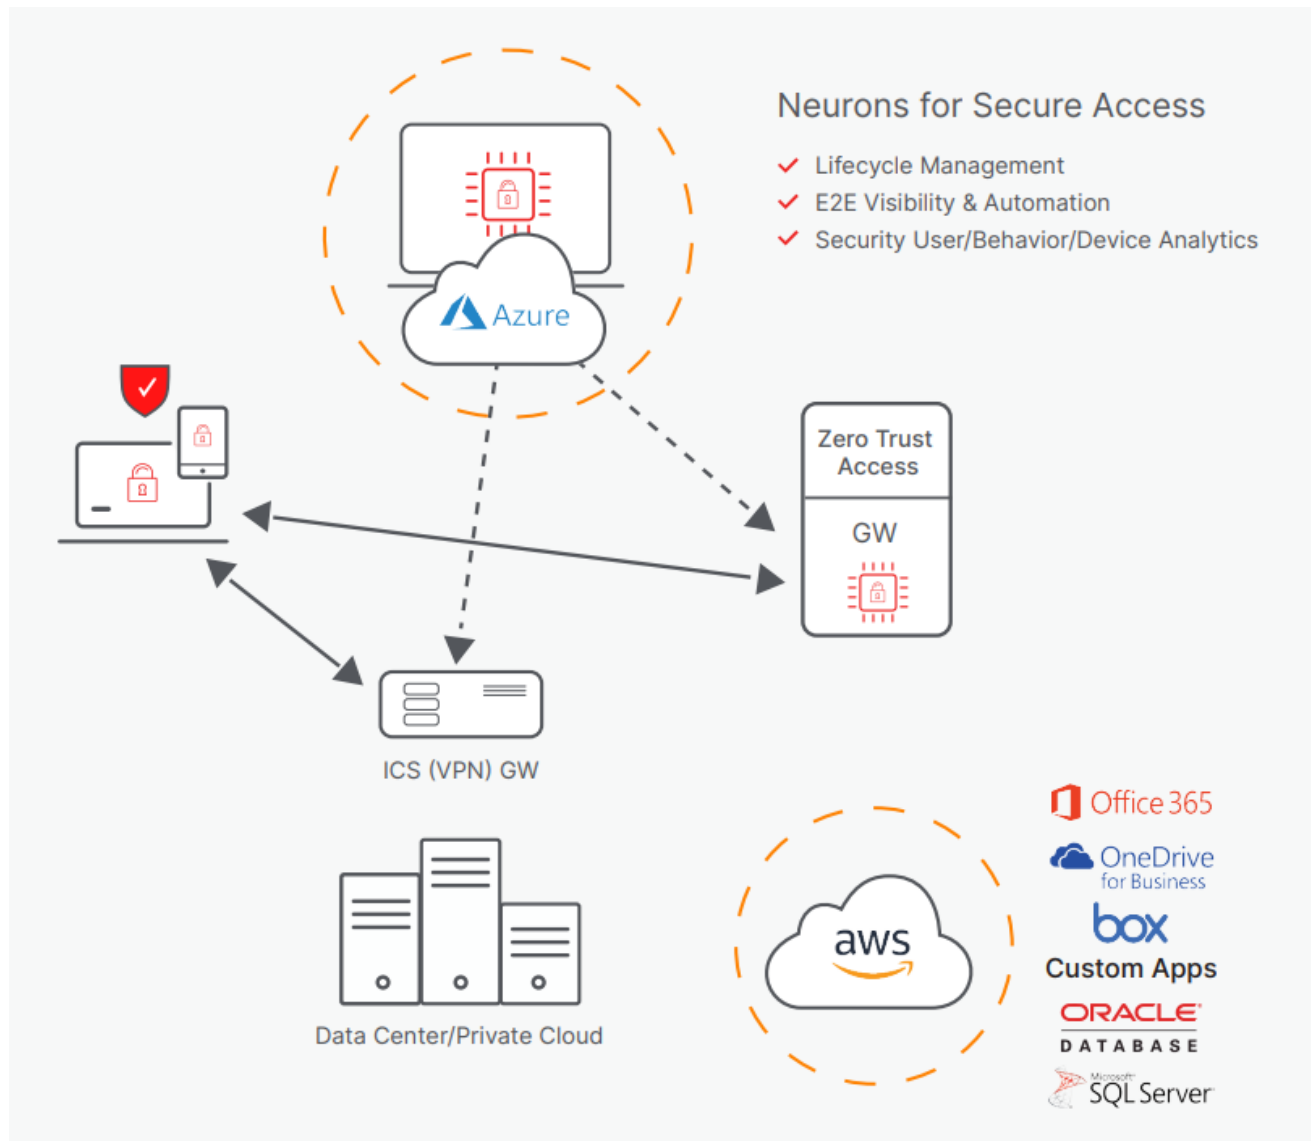

Document Revision	Date	Description
1.1	April 2025	nSA Release 22.8R1.2
1.0	January 2025	nSA Release 22.8R1

Ivanti Neurons for Secure Access Overview

Ivanti Neurons for Secure Access delivers centralized management and analytics from the cloud for Ivanti Connect Secure (ICS) VPN gateways. Its unified interface controls an entire ICS deployment, greatly reducing the time, complexity and risks of managing multi-node VPN deployments. Risky or anomalous user behavior is addressed with automated remediation while collated gateway logs and customizable reports deliver actionable insights. Neurons for Secure Access minimizes overhead and maintains a secure environment to maximize the value of your VPN.

Neurons for Secure Access (nSA) is a SaaS-delivered, and is designed to work with both Ivanti Connect Secure (ICS) and Neurons for Zero Trust Access (nZTA).

- nSA provides a unified interface allowing security admins to manage multiple gateways and/or locations quickly and efficiently.
- nSA simplifies workflows by consolidating all logging, reporting and activity data to a single pane of glass.
- Administrators gain powerful analytics tools to review the health status of their deployments as part of their daily routine.
- Proprietary risk scores identify non-compliant or anomalous user activity, enabling admins to identify risky user activity and react accordingly.
- Scheduled reports let admins design, customize and schedule reports to arrive in their inbox with the exact data they want to see.

nSA works with existing ICS deployments and does not require additional hardware to be implemented, nor must any network or connectivity changes be made in order to integrate nSA into an ICS deployment. Registering an ICS Gateway with nSA will initiate secure WebSocket communications between the ICS Gateway and nSA. Once connected, the ICS Gateway logs and analytics are uploaded to nSA and can be viewed and reported on from the nSA portal. Gateway-management duties allowing for the ability to upgrade, roll back and restart — as well as provide troubleshooting tools — are all enabled once ICS is connected to nSA.

The following list shows the supported features and benefits.

- **Secure Access Foundation:**
 - Manages Connect Secure Gateways and/or Zero Trust.
 - Access Gateways in all aspects.
 - Supports both existing and next-gen VPN gateways.
- **Gateway Lifecycle Management:** Enables centralized upgrades, downgrades and restarts.
- **Configuration Management:**
 - Supports gateway configurations.
 - Configuration groups for multi-node configuration management.
- **Single-Pane-of-Glass Visibility:** Holistic visibility and compliance reporting of users, devices, applications and infrastructure across the enterprise.
- **User Entity Behavior Analytics (UEBA):** Leverages analytical data to reduce security risks, detect anomalies, optimize user experience and adapt to a mobile workforce.
- **Local (Gateway) and Central Debugging:** Enables getting back to business faster.
- **Hybrid Configuration Support:** Gateways can be deployed in a variety of configurations including the cloud.

What's New

Version 22.8R1.2

Gateway Upgrade improvements

nSA now provides option to stage the package on individual Gateway/Cluster or multiple Gateways/Clusters, and upgrade the Gateways manually or on a specified date and time. The Gateway stage and upgrade from nSA is supported for ICS Gateway with base version 22.7R2.8. For more details, see ["Upgrading Gateways and Clusters with a New Gateway Version" on page 162](#).

NSA Syslog Server Integration

nSA enables you to configure external syslog server to forward ICS Gateway logs and nSA Tenant Admin logs. This enables centralized and secure log management and enhanced visibility into the health and efficiency of the services running in your ICS Gateways, or to facilitate debugging in the event of unexpected service behavior. For details, see ["Using Enterprise Integration to Export Your Logs for External Analysis" on page 511](#).

Config Sync enhancements

Config Sync enhancement supports configuring the entire configuration synchronization across multiple targets (up to 15 targets for entire configuration and 50 targets for selective configuration). This enhancement enhances flexibility and scalability for managing multiple gateways or clusters. This is particularly useful for enterprises with extensive networks, as it simplifies configuration management across various systems. This feature is supported from ICS Gateway 22.7R2.8 release. For details, see ["Config Synchronization" on page 168](#).

Segregation of app visibility logs

In order to avoid performance issue, app visibility logs is segregated from user access logs. App visibility logs is available in debug log/snapshot for troubleshooting. This feature is supported from ICS Gateway 22.7R2.8 release. For details, see ["Using the Debug Log" on page 575](#).

The maximum debug log file size for Gateways with disk space > 80 GB is increased to 1024 MB.

Reporting enhancements

- The number of scheduled/on-demand reports is increased to 10.

- Summary charts of gateways, user roles, application access, anomalies, non-compliance, and user risk now displays top 100 with more than 1 lakh users aggregation.
- User analytics now shows maximum top 30 users.

Admin experience enhancements

Search and Sort options are added for selective tables:

- Gateway > Users > Resource Policies
- Gateway > System > Configuration, Network, IF-MAP Federation, Log/Monitoring
- Gateway > Authentication > Signing In, Authentication Servers

Move Up and Down arrow option is disabled when Search function is applied to a table.

Feature parity with ICS Gateway release

UI changes made for the following features:

- For Gateways with disk space > 80 GB, maximum debug log file size is increased to 1024 MB. For details, see ["Using the Debug Log" on page 575](#). This change is applicable from ICS 22.7R2.6.
- VPN Tunneling Resource Policy configuration allows you to enable / disable IPv4 and IPv6 address assignments and specify IPv4 and IPv6 address ranges. For details, see ["VPN Tunneling Resource Policy Configuration Use Case" on page 471](#). This change is applicable from ICS 22.7R2.3.

Version 22.8R1

Enhancements to Tenant Admin Audit Logs for end-to-end admin activities

Tenant Admin logs now captures all the admin activities from login to logout. For more details, see ["Checking Tenant Admin Logs" on page 569](#)

Config Sync enhancements

Admin can now schedule config sync rule jobs to run only on a specified time or to run daily, weekly or monthly frequencies. For more details, see ["Scheduling Config Sync Rule Job" on page 177](#).

Support for multiple certificates with the same serial number

nSA Config Authoring can handle multiple certificates with the same serial number.

Admin experience enhancements

- Search and Sort options are added for tables in Gateway > Users > Roles, Realms, and Resource Profiles, and Authentication > Endpoint Security.

Version 22.7R1.6

(Preview)Enhancements to Tenant Admin Audit Logs for config change operations

Tenant Admin Logs page now additionally shows the audit logs generated for config change operations (create/update/delete) performed by all admins. For more details, see ["Checking Tenant Admin Logs" on page 569](#)

Config Sync enhancements

"Duplicate Rule" option is newly added in the Config Synchronization page to clone an existing, suitable config sync rule.. For more details, see ["Cloning a Config Sync Rule" on page 176](#).

Admin experience enhancements

- "Group by" option is added in the Gateway List page to filter the list based on Gateway Type, Connection status, Version or Region.

Version 22.7R1.5

(Preview)Tenant Admin Audit Logs for Gateway operations

Tenant Admin Logs page is newly added to show nSA admin audit logs generated for Gateway operations such as create, delete, upgrade, reboot and rollback.

For more details, see ["Checking Tenant Admin Logs" on page 569](#).

Password policy for XML configuration export and import, and TOTP users export and import

- Strengthening the XML configuration file import/export process with password authentication checks. For more details, see: ["Exporting an XML Configuration File" on page 505](#)
- Strengthening the TOTP server by adding password authentication checks for importing and exporting the users data file. For more details, see: ["Exporting/Importing TOTP Users" on page 309](#).

Config Sync enhancements

"Refresh Gateway Status" option is newly added in Config Synchronization Status page for target gateways with status "Pending", "Importing" or "Timed out". For more details, see ["Config Synchronization" on page 168](#).

Admin experience enhancements

- Alphabetical sorting (ascending / descending) is now possible in the Gateways List and the Config Synchronization pages. Use the arrow icon (↑) provided in the column header to show alphabetically sorted list.
- "Expand all / Collapse all" functionality is added in the Gateways List page. Use the Expand all / Collapse all icon (⌵) provided in the Gateways List page to expand / collapse the Clusters and Gateways lists.

Version 22.7R1.4

Admin experience enhancements

Column reordering is newly added in the Users L3 and L4 pages. To move a column, a user can click the header and drag to its new position.

For more details, see ["Ivanti Connect Secure Gateway Analytics" on page 51](#).

Version 22.7R1.3

Consolidated landing page

Drill down support for the Sankey chart is newly added on the consolidated landing page. With each chart, the View All link provides a page with detailed log records for that category. For more details, see ["Consolidated Landing Page" on page 52](#).

Multinode configuration status enhancement

Multinode configuration status now includes start and end timestamps and additional status information. For more details, see ["Config Synchronization" on page 168](#).

All Gateways counter

All Gateways counter is newly added on ZTA and nSA specific analytics landing page. For more details, see ["Reviewing Your Network Activity" on page 55](#).

Gateway name / Cluster name length

The maximum length of ICS Gateway name / Cluster name is increased to 19 characters. Admin can now register the existing ICS Gateway Cluster with cluster name length up to 19 characters to nSA. For more details, see ["Registering Ivanti Connect Secure Gateway" on page 32](#) and ["Creating an ICS Cluster" on page 155](#).

Feature parity with ICS Gateway 22.7R2.1 version

- **Max log Size for Event logs:** The range is 1- 200 MB and the maximum size is 200 MB for Virtual Appliances. The range is 1- 1024 MB and the maximum is 1GB/1024MB for ISA Hardware. For details, see ["Events to Log" on page 245](#).
- **Play integrity check for rooting detection on Android devices:** checks if interactions and server requests are coming from the genuine app binary running on a genuine Android device. For details, see ["Mobile Configuration" on page 234](#)

Version 22.7R1.2

(Preview) Consolidated landing page

A new unified landing page allows tenant admin to examine the shared Analytics tables and charts for nZTA and ICS Gateways. For more details, see ["Consolidated Landing Page" on page 52](#).

Admin UI user experience enhancements

Improvements to the admin experience (Modernize the table view for session management and log view). Advanced filter on the page for managed users. For more details, see:

- ["Checking the Logs" on page 118](#)
- ["Managing the Sessions" on page 141](#)
- ["Viewing Admin Authentication Methods" on page 530](#)
- ["Viewing Admin Authentication Policies" on page 531](#)
- ["Creating Admin Groups" on page 540](#)

Sync Now

A new Sync Now page allows tenant admin to implement changes made to Admin Management and correct any configuration problems based on the alerts. For more details, see ["Ivanti Connect Secure Gateway Analytics" on page 51](#).

Version 22.7R1

Admin Management user experience enhancement

User experience for Administration > Admin Management is enhanced in this release. For details, see ["nSA Administration" on page 529](#).

Password Strengthening for Local Authentication Server

The local authentication server has stronger password restrictions. For details, see ["Workflow: Creating a Local Authentication Policy" on page 548](#).

Feature parity with 22.7R2 ICS Gateway release

- FAV Icon: User can add/update FAV icon on Authentication > Signing Pages to change Gateway admin and end user FAV icon. For details, see ["Configuring Standard Sign-In Pages" on page 323](#).
- IMEI option is removed for Microsoft Intune on Authentication > Authentication Servers > MDM server. For details, see ["Configuring MDM Authentication Server" on page 309](#).
- AAA traffic is added for MDM and OAuth Server on Authentication > Authentication Servers. For details, see ["AAA Traffic Management" on page 286](#).
- SAML/ Web Server: New setting is added to monitoring the SAML/Web server, see ["Configuring System Maintenance Options" on page 492](#).
- Integrity Check: Booting Options on Integrity Check Failure is newly introduced to check integrity check failures during boot up (Disabled by default). Options are added to Reboot, rollback or continue booting if integrity check fails, see ["Miscellaneous Setup" on page 194](#).
- TLSv1.3: Browser based TLSv1.3 certificate authentication using Port Redirection is now added. Also more Key Exchange Options are added for Encryption Strength. For details, see ["Inbound SSL Options" on page 188](#).
- Warning is added to Config Export and Gateway Upgrade pop-up if more than one active client package exists, see ["Exporting a Binary System Configuration File" on page 497](#).
- Mobile Options: IF-T/TLS NCP knob option is newly added for Mobile, see ["Mobile Configuration" on page 234](#).

Version 22.6R1

IPv6 L3 VPN Application Visibility (Supported only for 22.x ICS Gateway)

Support for IPV6 L3 VPN visibility in nSA. You can view both IPv4 and IPv6 applications for L3 user sessions from the Applications overview page. For details, see ["Using the Applications Filter Bar" on page 95](#).

nSA Named User License Normalization (Supported only for ICS 22.6R2 Gateway with ISAC 22.6R1 Client and later versions):

Normalization of license seat reservation across devices and users. Single license is consumed instead of two through associating devices with users for Machine Cert Authentication and subsequent User Authentication. For details, see ["nSA Licensing/Subscription" on page 525](#).

nSA Feature parity with 22.6R2 ICS gateway

- Resource policies > VPN Tunneling > Connection Profile > DHCP Subnet - 22.x
- HTML5 Bookmark - Enable Auto Resolution Option - 22.x and 9.x
- User Roles Options - Enable Auto Resolution Option - 22.x and 9.x
- System > Configuration > SAML > New SAML > Hide PDP Option - 22.x
- Hide Authentication > Auth Servers > LDAP server > Health check - Test username, Test Password and Validate User Credential fields - 9.x
- Authentication > Auth Servers > LDAP server > Health check - Test username, Test Password and Validate User Credential fields - 22.x
- System > Configuration > Security > Miscellaneous > Relay state option - 22.x

Support SAML Authentication server as a secondary authentication server when configuring Certificate Authentication server (Supported only for 22.x ICS Gateway)

nSA now supports configuration of Certification Authentication server with SAML Authentication server as a secondary authentication server. For details, see ["Configuring Certificate Authentication Server" on page 296](#).

Admin experience enhancements to L4, Gateway Logs, and Logs Tables in terms of selection and resizing, pagination, and text copy/paste

The following list shows the enhancements to L4, Gateway Logs, and Logs Tables.

- Column resizing across ICS pages
- Cell content copy text from Table
- Pagination across ICS pages

- Minimum number of columns in all the tables in L4 dashboards
- Enhancement to Advanced Filter

For details, see ["Using the Top Active Breakdown Charts" on page 80](#) and ["Filtering the Logs" on page 123](#).

Version 22.5R1

Admin Access Control Based on Location, Host Checker, and Network

Checks the Admin's device geographic location/network/host checker compliance for admin sign-in policy before providing access to admin login. For details, see ["Creating Admin Policies" on page 532](#).

Auto Selecting Dependent Configurations as part of Config Sync

While creating config sync rule, if there is any dependency mismatch, admin can review dependent configurations and select them before creating/editing rule.

For example, If realm configuration is mapped to Authentication server and if config sync rule is created with only realm. The dependent configuration is highlighted (Auth server). Realm configuration is highlighted with **i** icon and when dependencies are reviewed, Authentication server is mentioned in the dependency tree.

Preview of changes done in source gateway before config sync. This feature is available only with Manual sync.

Preview before sync works only when one manual config sync rule is triggered.

For details, see ["Config Synchronization" on page 168](#).

Version 22.4R3

Role Based Access Control for Admin Users

With Role-based access control (RBAC), organizations can easily add admins and assign them specific roles, with differing levels of access to the nSA Admin Portal. In addition to an existing set of default roles, Administrators can now create custom granular roles for specific functions within the nSA admin portal.

For details, see ["Role-based Access Control for Admin Users" on page 544](#).

Version 22.4R1

Analytics: Historical View

Analytics supports data visualization in Active View. Admin can see the historic data on different time windows. Admin's can find all connections details for different time frames past 30 days. For details, see ["Using the Filter Bar" on page 56](#).

Config Sync Rule Status

This feature allows a user to view the config sync rule status of all target gateways. For details, see ["Config Synchronization" on page 168](#).

nSA named user licensing normalization

This feature allows a user to use different login formats - Domain\username, Common Name (CN), and User Principal Name (UPN) - from different devices, but consumes only one seat for the user. For details, see ["nSA Licensing/Subsription" on page 525](#).

Logging in to Ivanti Neurons for Secure Access

- ["Preparing to Log in" below](#)
- ["Logging in to the Ivanti Neurons for Secure Access as a Tenant Admin" below](#)
- ["Logging out of the Ivanti Neurons for Secure Access" on page 30](#)

Preparing to Log in

To log in to Ivanti Neurons for Secure Access (nSA), you require a Tenant Admin login.

All Tenant Admin accounts are set up by the Ivanti DevOps team. Once your Tenant Admin account has been created, you will receive an email which describes how to log in to the nSA as a Tenant Admin.

You can then proceed to log in to nSA. See ["Logging in to the Ivanti Neurons for Secure Access as a Tenant Admin" below](#).

Logging in to the Ivanti Neurons for Secure Access as a Tenant Admin

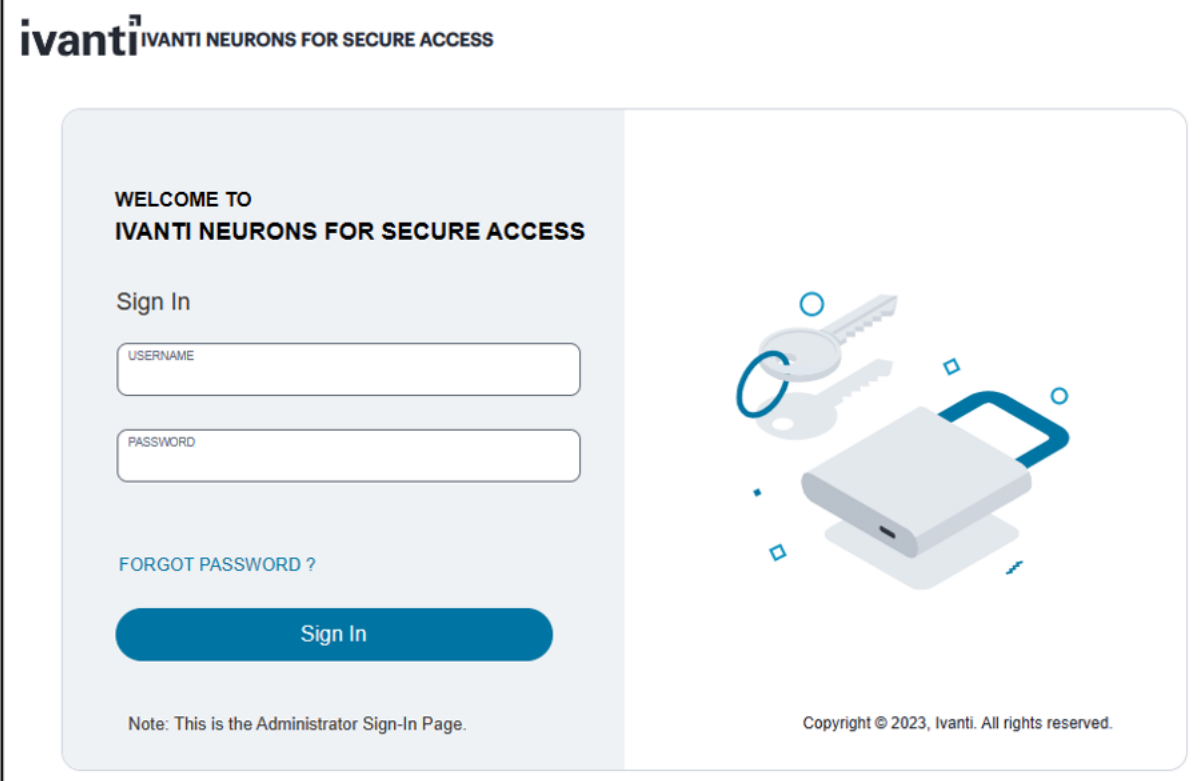

Before you can log in as a Tenant Admin, you will receive an email from the Ivanti DevOps team. This email contains:

- Your Tenant Admin user name.
- Your password.
- The nSA domain. That is, the FQDN of Ivanti Neurons for Secure Access.
- An Admin hyperlink to start the login process. Example: <https://<tenant FQDN>/login/admin>

To log in to your Tenant Admin account:

1. Click the hyperlink in your email.

The administrator login page appears.

The screenshot shows the administrator login page for Ivanti Neurons for Secure Access. The page has a light blue header with the Ivanti logo and the text "IVANTI NEURONS FOR SECURE ACCESS". The main content area is divided into two sections. The left section is a light blue box containing the text "WELCOME TO IVANTI NEURONS FOR SECURE ACCESS", a "Sign In" heading, two input fields labeled "USERNAME" and "PASSWORD", a link for "FORGOT PASSWORD?", a blue "Sign In" button, and a note at the bottom: "Note: This is the Administrator Sign-In Page." The right section is white and features a 3D illustration of a key and a padlock. At the bottom right of the page, there is a copyright notice: "Copyright © 2023, Ivanti. All rights reserved."

2. Log in using your supplied Tenant Admin credentials. If you are logging in for the first time, system prompts for a password reset.

The following timeouts are used for all Admin sessions:

- The idle timeout is 10 minutes.
- The session timeout is 60 minutes.

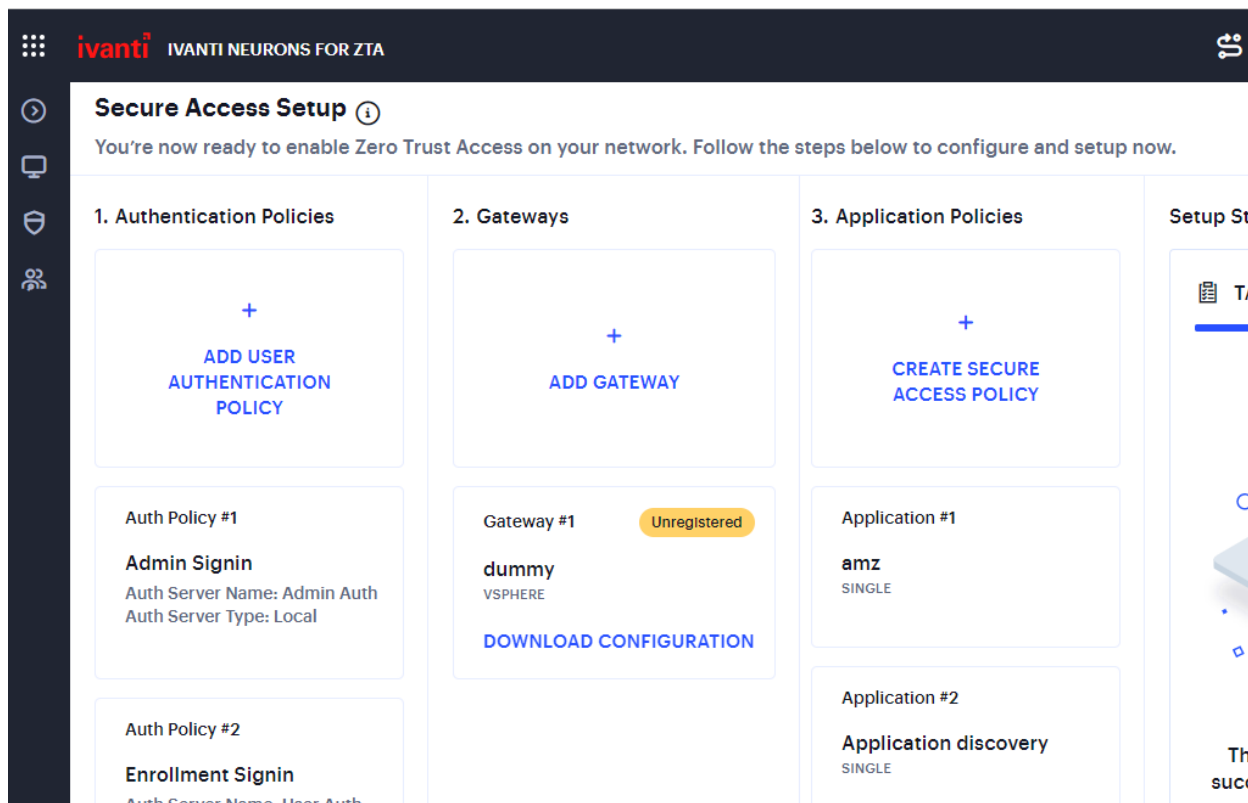

To reset a forgotten password, click **FORGOT PASSWORD**. This link presents a credentials form through which you enter a Username and Email address. If the entered credentials match a registered administrator account, /CS emails a password reset link to the entered address allowing the recipient to create a new password.

3. If nSA requests it, specify a new password for your account.

Once this procedure is complete, you can access the nSA graphical interface as an admin user.

The **Secure Access Setup** page appears.

4. Click '9 dots' on extreme left corner. Choose **Ivanti Connect Secure**. These two steps are required for every login.

From this page, you can view and configure all functions and capabilities allowed through your subscription and role. Using the Ivanti Connect Secure menu at the left-hand side, choose from:

- The **Show/Hide** menu icon, providing the ability to show or collapse the Ivanti Connect Secure menu tree:

- The **Insights** menu icon, providing access to the analytics and monitoring components of the nSA portal:

To learn more about the functionality offered by this menu, see "[Ivanti Connect Secure Gateway Analytics](#)" on page 51.

- The **Gateways** menu icon, providing access to register and manage the Gateways:

- The **Administration** menu icon, providing access to administrative functions related to your ICS subscription:

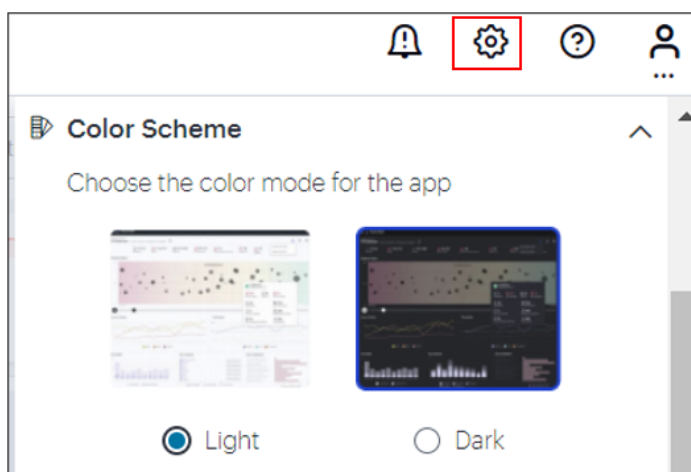

The chapters in this guide cover each of these functions in detail.

Changing the UI Theme

nSA offers two themes for your UI display:

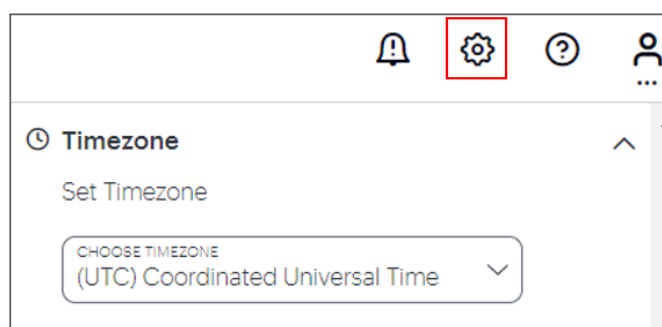

To change the current theme, which remains in place through subsequent logins, use the **Settings** menu located on the top-right-corner of the page:

Through the **Color Scheme** panel (indicated), click **Light** or **Dark** to switch between themes.

Setting the Timezone

To configure the default timezone for this admin login account, use the **Settings** menu located on the top-right-corner of the page:

Choose a timezone in the provided drop-down selector, then click **Apply**.

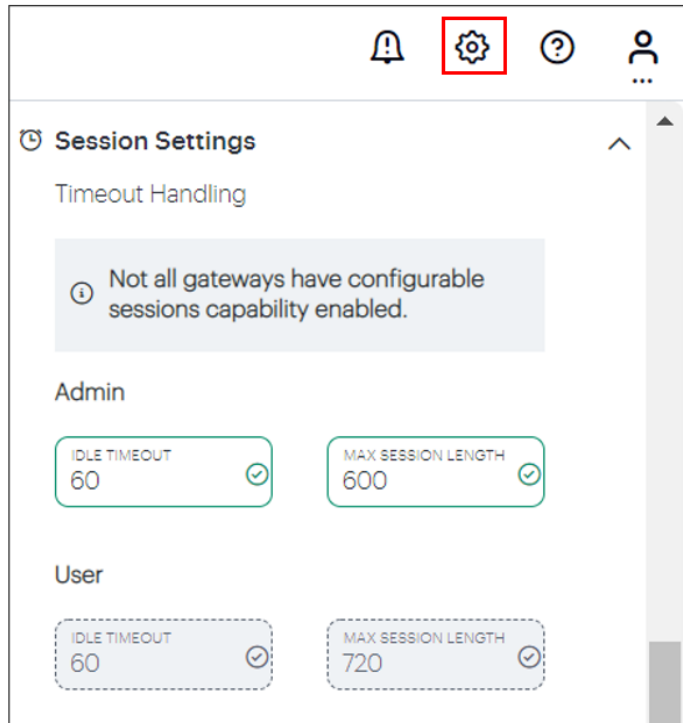

The configured timezone affects the display of data on all **Insights** pages, and each admin login account within a tenant deployment has their own specific timezone configuration. Changes to the timezone persist across login sessions, and the default setting is *UTC (Coordinated Universal Time)*.

Changing the timezone can affect the data displayed in each chart or graph. For example, a recently-observed non-compliance event involving a client device in the GMT timezone that appears in the *Last Hour* view (when using GMT (UTC + 00:00) as your configured timezone) might then only appear in the *Last X Hours* view when you switch your timezone to IST (UTC+05:30).

Configuring Session Timeouts

To configure timeout values for admin and user sessions, use the **Settings** menu located on the top-right-corner of the page:

Through the **Session Settings** panel (indicated), you can set the following timeout values:

- **Admin Idle Timeout:** the time, in minutes, after which the admin login session to the Tenant Admin Portal times out due to inactivity. (default: 10)
- **Admin Max Session Length:** the time, in minutes, after which the admin login session to the Tenant Admin Portal ends and must be re-authenticated. (default: 60)
- **User Idle Timeout:** the time, in minutes, after which the user login session to nSA times out due to inactivity. (default: 60)
- **User Max Session Length:** the time, in minutes, after which the login session to nSA ends and must be re-authenticated. (default: 720)

To apply your changes, click **APPLY**.

To use these settings, your configured Gateways must all meet minimum version requirements for session control. nSA disables the panel and displays a warning message if this is not the case.

Logging out of the Ivanti Neurons for Secure Access

To log out of the nSA and end the current session, click the *Profile* icon and select **Logout**.

Managing Existing Ivanti Connect Secure 9.x Appliance

The existing Ivanti Connect Secure 9.x appliance can be managed by Ivanti Neurons for Secure Access (nSA), by upgrading the appliance to the nSA managed 9.1R11.5 version. Note that the fresh installation is not available for this release.

The screenshot shows the 'System Maintenance > Platform' page. The 'Platform' tab is selected, displaying a list of system details. A red box highlights the 'Current version: 9.1R11.5 (build 14110)' and another red box highlights the note: 'Note: This PCS can be managed by Ivanti Neurons for Secure Access.' Below the details, there are sections for 'Node operations' (with a 'Reboot this node...' button), 'Cluster operations' (with buttons for 'Restart Services', 'Reboot...', 'Shut Down...', and 'Rollback...'), and 'Connectivity' (with a 'Test Connectivity' button).

Platform	Upgrade/Downgrade	Options	Installers
	Cluster: PSA-IQ-5K Hostname: N-186 Model: PSA-5000 Machine ID: 0320M52NS0DYM0HOS Serial Number: 0320062017100026 Uptime: 1 day, 21 hours, 36 minutes, 36 seconds Current version: 9.1R11.5 (build 14110) Rollback version: 9.1R11 (build 11160) Note: This PCS can be managed by Ivanti Neurons for Secure Access.		
Node operations: <button>Reboot this node...</button>			
Cluster operations: Cluster operations affect all nodes in the cluster. <button>Restart Services</button> <button>Reboot...</button> <button>Shut Down...</button> <button>Rollback...</button>			
Connectivity: This will ping various configured servers to test the device's connectivity. <button>Test Connectivity</button>			

The note "This Ivanti Connect Secure can be managed by Ivanti Neurons for Secure Access" confirms that the appliance is upgraded to the correct version.

Registering Ivanti Connect Secure Gateway

- ["Completing Registration of an ICS Appliance" on page 35](#)
- ["Reregistration of ICS Gateway" on page 37](#)

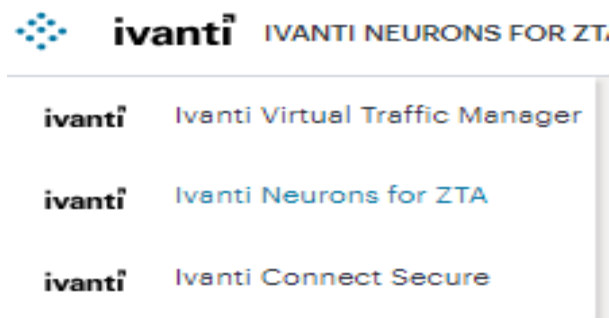

Once you have logged into the Ivanti Neurons for Secure Access, the next step is to launch Ivanti Connect Secure Gateway UI, then register one or more ICS.

For MTLS to function correctly, SSL inspection should be disabled between the Client and nSA and also between ICS Gateway and nSA.

To launch ICS Gateway UI

1. In the Ivanti Neurons for Secure Access UI, select the Gateway Switcher icon located on the top left corner.

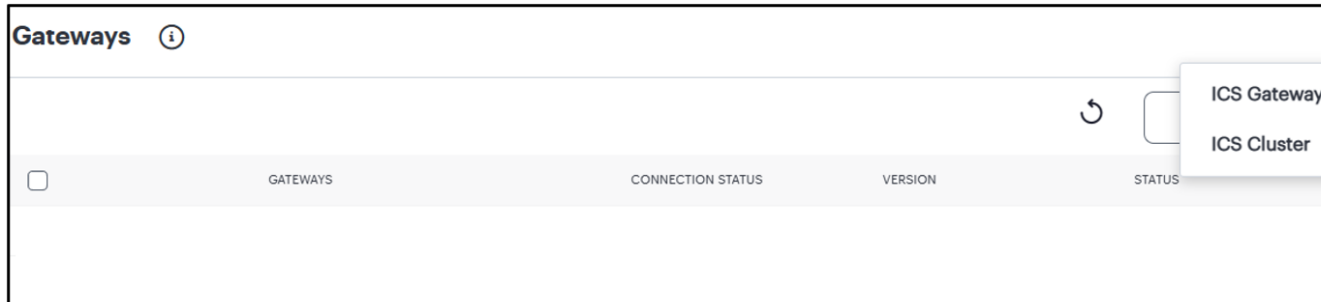

2. From the list, select **Ivanti Connect Secure**.

The Ivanti Connect Secure UI page is displayed.

To register ICS Gateway:

1. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The Gateways List page is displayed.

2. In the Gateways List page, click the **Create** drop-down list.
3. From the Gateway types list, select **ICS Gateway**.

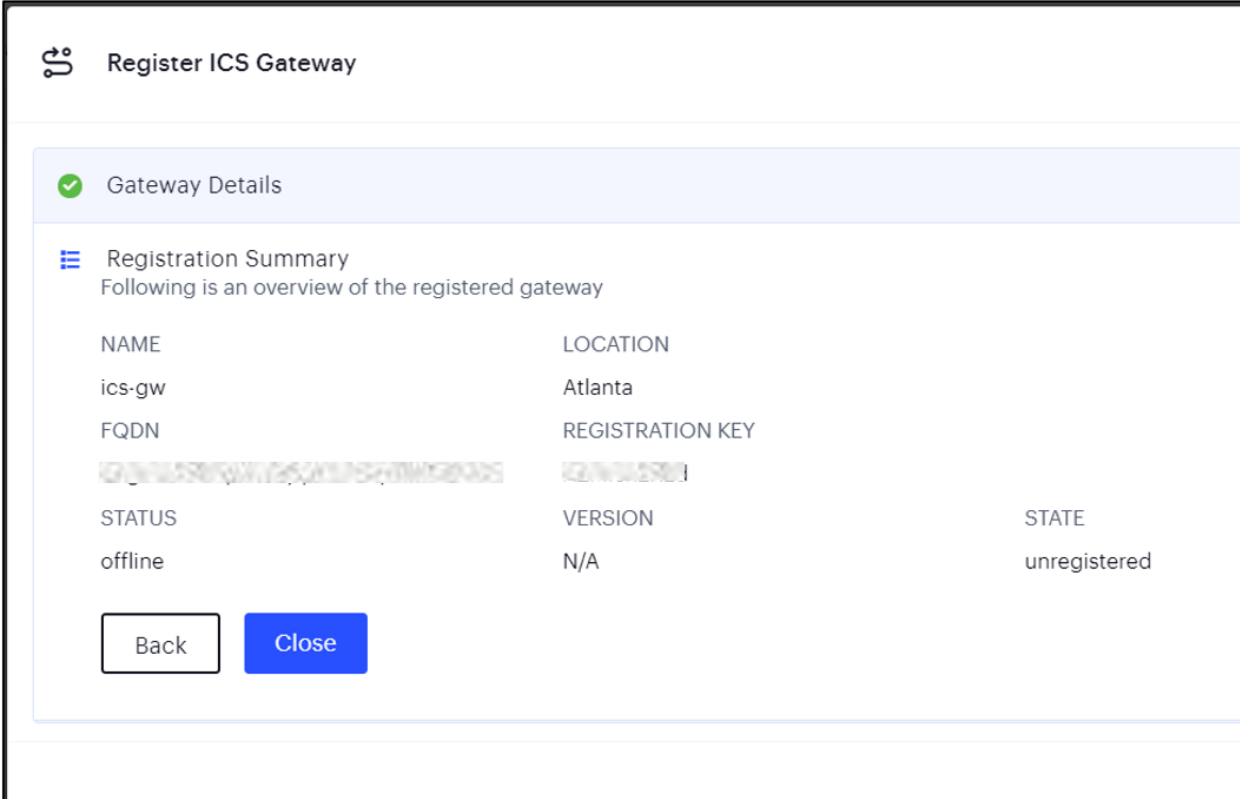

The Register ICS Gateway page is displayed.

- Enter a unique name for ICS gateway.

 The name should be maximum 19 characters, only alphanumeric, underscores, and hyphens are allowed between characters, and **must start with a letter**.

 When registering a Clustered ICS gateway with nSA, ensure that the name of the gateway in nSA corresponds to the name of the node in the ICS gateway. As an example, suppose a cluster "Test" consists of two nodes, "gw1" and "gw2". Register gateways with the names "gw1" and "gw2," and the nSA cluster forms automatically.

- Enter your Location details such as Country, State/Region, City, and then click **Register**.

NAME	LOCATION	
ics-gw	Atlanta	
FQDN	REGISTRATION KEY	
192.168.1.100	12345678901234567890	
STATUS	VERSION	STATE
offline	N/A	unregistered

Back Close

The Registration Summary page contains the FQDN URL and Registration Key, which you need to enter in the ICS Gateway to complete the registration. See ["Completing Registration of an ICS Appliance" on the next page](#).

- Click **Close**.

The newly added ICS Gateway gets listed as "Unregistered" under ICS Gateways list.

Completing Registration of an ICS Appliance

For all platforms, make sure the firewall rules for the Public Subnet in which your ICS Gateway External Interface resides is configured to accept inbound client connections on TCP port 443.

Furthermore, make sure you configure the Network Gateway serving your Private Subnet to allow outbound traffic to the nSA Controller in the following ways:

- Allow outbound TCP traffic on port 443 to the Controller service
- Allow outbound UDP traffic to the following Network Time Protocol (NTP) services:
 - time.windows.com (port 123)
 - time.nist.gov (port 123)

We recommend you use NTP server to ensure the clocks are synchronized and features on Ivanti Neurons for Secure Access work properly.

To complete registration of a ICS appliance:

1. Log in to the ICS appliance as an Admin.
2. Select the **System > Configuration > Ivanti Neurons for Secure Access > Settings** tab.
3. Enter the Registration FQDN and Registration Code.

The Registration FQDN and Registration Code were displayed during ICS Registration with nSA”.

5. Register the ICS Gateway as described in "[Registering Ivanti Connect Secure Gateway](#)" on [page 32](#).

Ivanti Connect Secure Gateway Deployment

The following sections describe the new parameters that are added for the deployment of Ivanti Connect Secure VA on VMware, Amazon Web Services cloud and Microsoft Azure cloud.

- ["Deploying on VMware" below](#)
- ["Deploying on Hyper-V" on the next page](#)
- ["Deploying on KVM" on the next page](#)
- ["Deploying on AWS Cloud" on the next page](#)
- ["Deploying on Azure Cloud" on page 47](#)
- ["Deploying on Google Cloud Platform" on page 50](#)

Deploying on VMware

For a detailed ICS VA deployment procedure, refer to *Virtual Appliance Deployment Guide* at <https://www.ivanti.com/support/product-documentation>.

This below table describes the new parameters that are added in the script file **create-va.pl**, which is included in your ISA-V package.

Sample Script Parameters - New Parameters

Parameter	Description
New Parameters	
registrationCode	The registration code, which is generated during the ICS gateway registration on nSA. Example, KyZR6YDL8
registrationFQDN	The registration FQDN name, which is generated during the ICS gateway registration on nSA. Example, auto.lark.pzt.dev.perfsec.com
enableproxy	Default is set to n.
proxyHost	The proxy server name.

Parameter	Description
proxyPort	The port number of the proxy server. Example, 8080
proxyUsername	The username of the proxy server. Example, usr
proxyPassword	The password of the proxy server. Example, pxx124
registerNetworkInterface	The interface through which the gateway registers with nSA. Example, external

Deploying on Hyper-V

For a detailed ICS on Hyper-V deployment procedure, refer to *ICS Gateway Deployment on Hyper-V Platform* at <https://www.ivanti.com/support/product-documentation>.

Deploying on KVM

For a detailed ICS on KVM deployment procedure, refer to *ICS Gateway Deployment on KVM Platform* at <https://www.ivanti.com/support/product-documentation>.

Deploying on AWS Cloud

For a detailed ICS VA on AWS Cloud deployment procedure, refer to *Virtual Appliance on Amazon Web Services Deployment Guide* at <https://www.ivanti.com/support/product-documentation>.

Ivanti Connect Secure accepts the following parameters as provisioning parameters in the XML format.

```
<pulse-config>
```

```
  <primary-dns><value></primary-dns>
```

```
  <secondary-dns><value></secondary-dns>
```

```
  <wins-server><value></wins-server>
```

```
  <dns-domain><value></dns-domain>
```

```
  <admin-username><value></admin-username>
```

```
  <admin-password><value></admin-password>
```

```

    <cert-common-name><value></cert-common-name>

    <cert-random-text><value></cert-random-text>

    <cert-organisation><value></cert-organisation>

    <config-download-url><value></config-download-url>

    <config-data><value></config-data>

    <auth-code-license><value></auth-code-license>

    <enable-license-server><value></enable-license-server>

    <accept-license-agreement><value></accept-license-agreement>
  >

    <enable-rest><value></enable-rest>

    <registration-code> 1grkL2Xbr </registration-code>

    <registration-fqdn>auto.toad.pzt.dev.perfsec.com</registration-fqdn>

    <enable-proxy>n</enable-proxy>

    <proxy-host></proxy-host>

    <proxy-port></proxy-port>

    <proxy-username></proxy-username>

    <proxy-password></proxy-password>

    <register-network-interface>external</register-network-interface>
</pulse-config>

```

The below table describes the new parameters that are added in the XML file.

XML File Details - New Parameters

Parameter	Type	Description
New Parameters		
registrationCode	string	The registration code, which is generated during the ICS gateway registration on nSA. Example, KyZR6YDL8
registrationFQDN	string	The registration FQDN name, which is generated during the ICS gateway registration on nSA. Example, sample.domain.com
enableproxy	string	Default is set to n.
proxyHost	string	The proxy server name.
proxyPort	integer	The port number of the proxy server. Example, 8080
proxyUsername	string	The username of the proxy server. Example, usr
proxyPassword	string	The password of the proxy server. Example, pxx124
registerNetworkInterface	string	The interface through which the gateway registers with nSA. Example, external

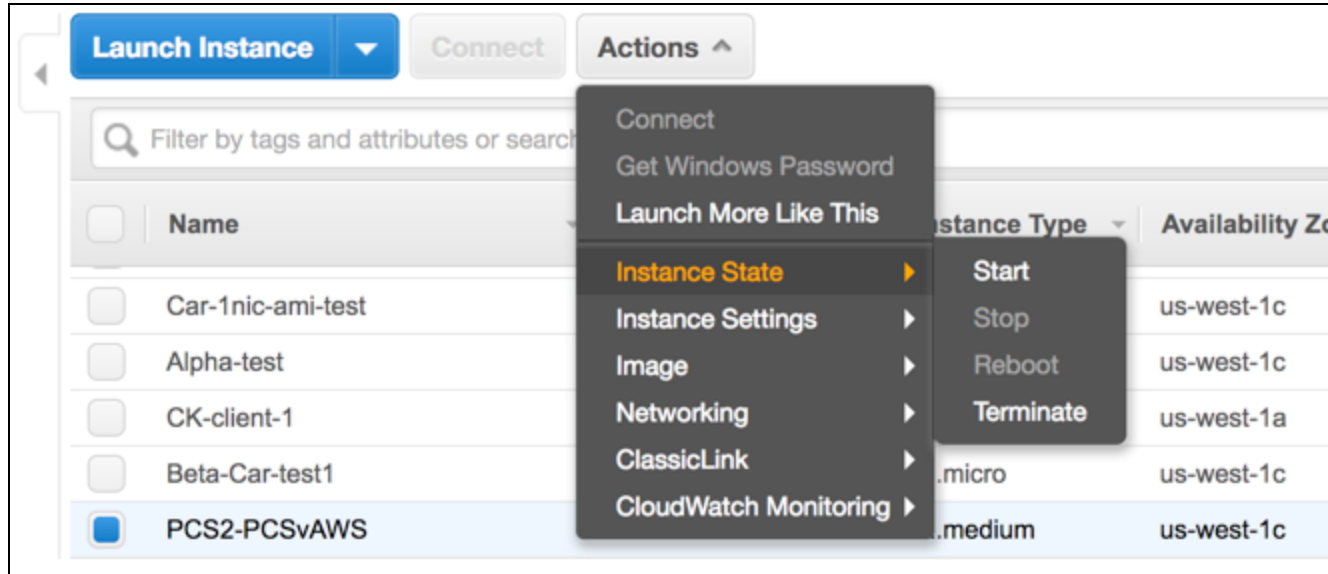

The XML parsing fails if the following characters are used in the strings:

- """"
- ""'''
- "<"
- ">"
- "&"

System Operations

The AWS portal provides Start, Restart Stop and Terminate operations to control the Virtual Appliance connection.

On the AWS portal, select **AWS Services > Launch Instance**. From the Actions menu, select **Instance State**.

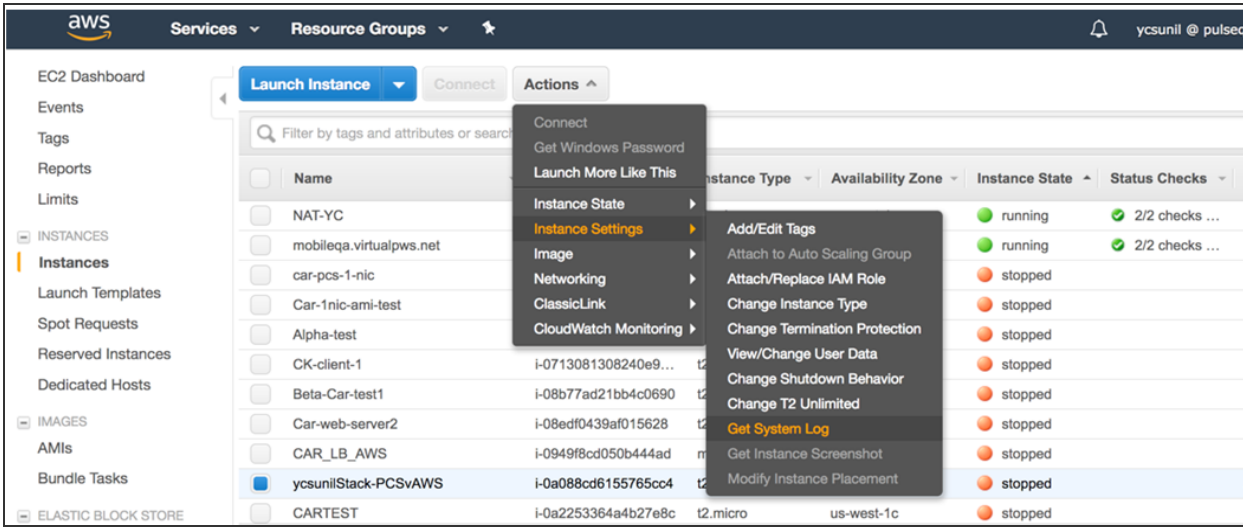

- Click **Start** to start a VM
- Click **Stop** to stop the VM
- Click **Restart** to restart the VM
- Click **Terminate** to terminate the VM

Troubleshooting

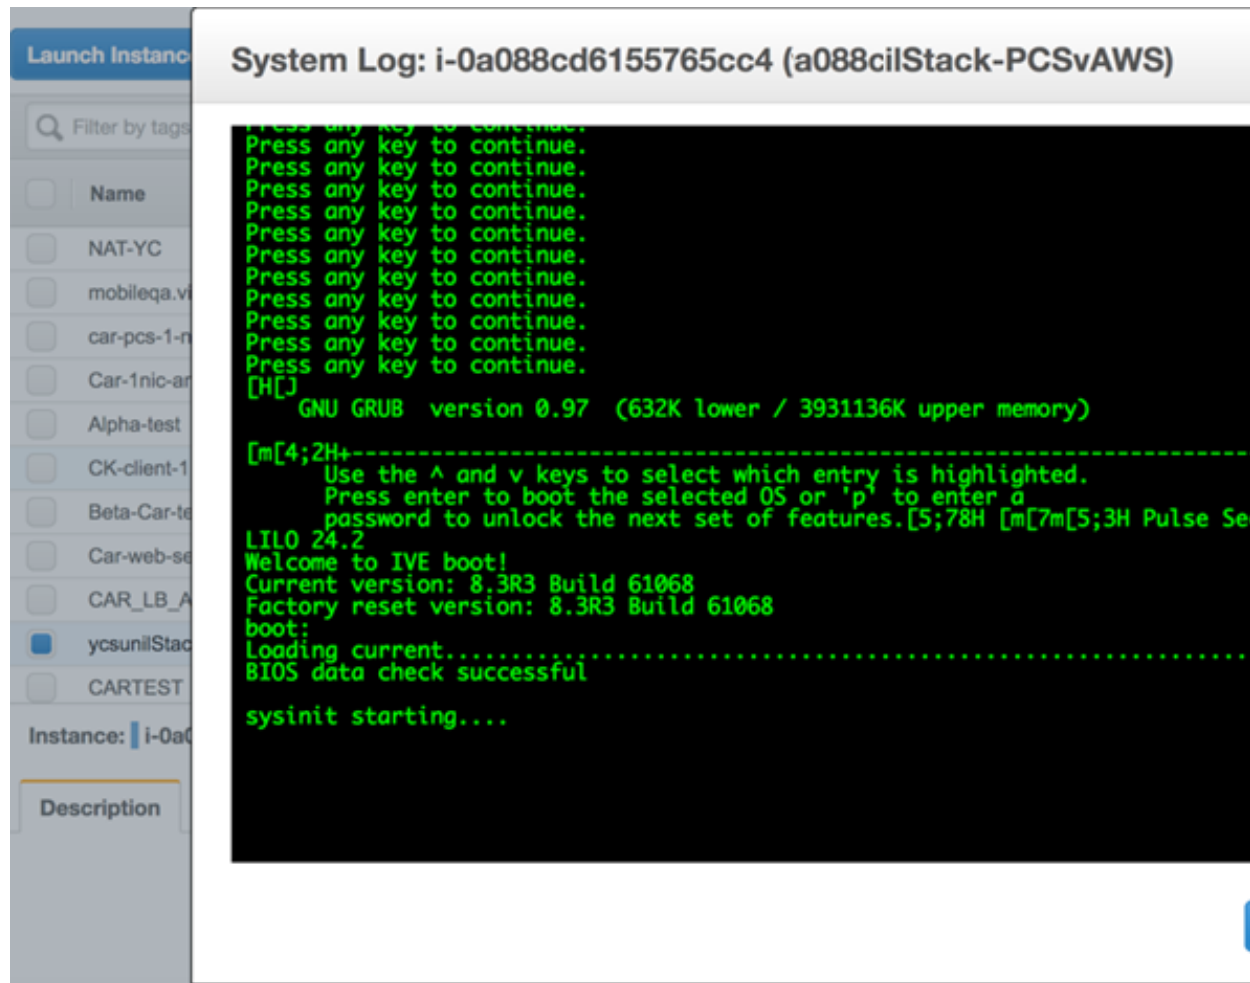

Ivanti Connect Secure emits booting logs at a specified storage. You can check the storage details of the boot diagnostic logs as shown below:

1. Select **AWS Services > Instances > Launch Instance**.

2. From the list displayed, select **Instance Settings > Get System Log**.

The system logs window is displayed.

Frequently Asked Questions

FAQ1: Packets transmitted from ICS Internal Interface are getting dropped by AWS Virtual Gateway in L3 traffic.

Cause: The packets are dropped because the source IP and MAC address are not matching and the transit routing is not supported.

Solution: Ivanti Connect Secure must be able to SNAT these packets to the Internal interface IP which belongs to a subnet within the VPC.

To NAT endpoint tunnel IP to Internal interface IP, do the following:

1. Log in to Ivanti Connect Secure admin console.
2. Navigate to **System > Network > VPN Tunneling**.

3. Enable **Source NATTING**. By default, Source NATTING is disabled.

Source NATTING

☒ Enable

☐ Disable

Deploying on Azure Cloud

For a detailed deployment procedure, refer to *Virtual Appliance on Microsoft Azure Deployment Guide* at <https://www.ivanti.com/support/product-documentation>.

Ivanti Connect Secure accepts the following parameters as provisioning parameters in the XML format.

"<pulse-config>

<primary-dns>8.8.8.8</primary-dns>

<secondary-dns>8.8.8.9</secondary-dns>

<wins-server>1.1.1.1</wins-server>

<dns-domain>psecure.net</dns-domain>

<admin-username>admin</admin-username>

<admin-password>password</admin-password>

<cert-common-name>val.psecure.net</cert-common-name>

<cert-random-text>fdsfpisonvsfnms</cert-random-text>

<cert-organisation>Psecure Org</cert-organisation>

<config-download-url><value></config-download-url>

<config-data><value></config-data>

<proxy-port></proxy-port>

<proxy-username></proxy-username>

<proxy-password></proxy-password>

<register-network-interface>external</register-
network-interface>

</pulse-config>"
```

The below table describes the new parameters that are added in the XML file.

XML File Details

Parameter	Type	Description
New Parameters		
registrationCode	string	The registration code, which is generated during the ICS gateway registration on nSA. Example, KyZR6YDL8
registrationFQDN	string	The registration FQDN name, which is generated during the ICS gateway registration on nSA. Example, sample.domain.com

Parameter	Type	Description
enableproxy	string	Default is set to n.
proxyHost	string	The proxy server name.
proxyPort	integer	The port number of the proxy server. Example, 8080
proxyUsername	string	The username of the proxy server. Example, usr
proxyPassword	string	The password of the proxy server. Example, pxx124
registerNetworkInterface	string	The interface through which the gateway registers with nSA. Example, external

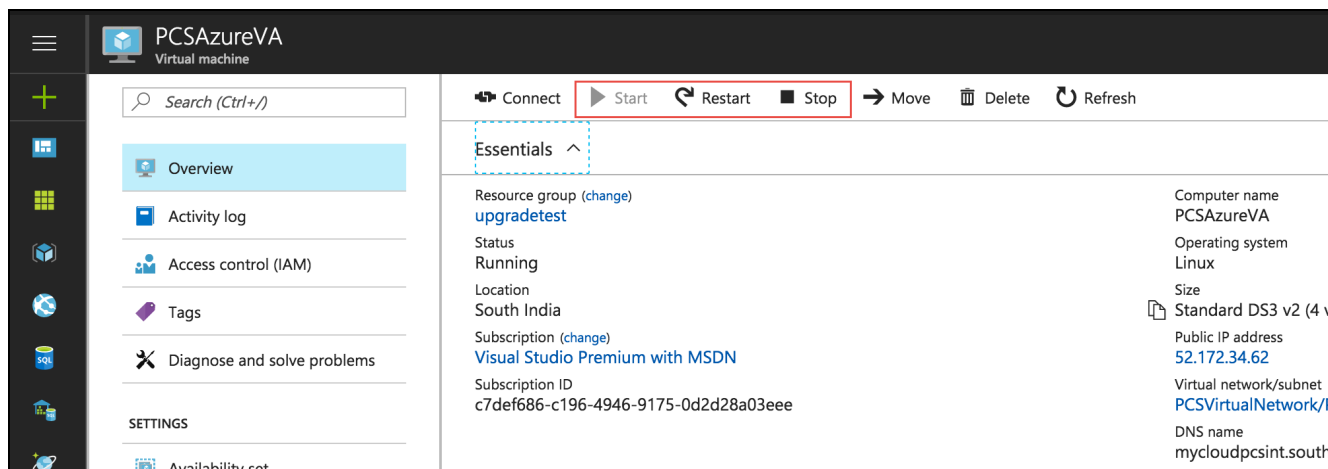

The XML parsing fails if the following characters are used in the strings:

- ""
- '"'
- "<"
- ">"
- "&"

System Operations

The Azure VA portal provides Start, Restart and Stop operations to control the Virtual Appliance connection.

On the Azure portal top menu bar:

- Click **Start** to start a VM
- Click **Stop** to stop the VM
- Click **Restart** to restart the VM

The corresponding CLI commands are:

- Start a VM

```
az vm start --resource-group myResourceGroup --name myVM
```

- Stop a VM

```
az vm stop --resource-group myResourceGroup --name myVM
```

- Restart a VM

```
az vm restart --resource-group myResourceGroup --name myVM
```

Deploying on Google Cloud Platform

For a detailed ICS on GCP deployment procedure, refer to *ICS Gateway Deployment on Google Cloud Platform* at <https://www.ivanti.com/support/product-documentation>.

Ivanti Connect Secure Gateway Analytics

- ["Introduction" below](#)
- ["Consolidated Landing Page" on the next page](#)
- ["Reviewing Your Network Activity" on page 55](#)
- ["Reviewing Users Activity" on page 83](#)
- ["Reviewing Application Usage" on page 93](#)
- ["Reviewing Individual User Activity" on page 105](#)
- ["Reviewing Gateways Status and Versions" on page 111](#)
- ["Checking the Logs" on page 118](#)
- ["Configuring Actionable Insights" on page 131](#)
- ["Generating Reports" on page 134](#)
- ["Managing the Sessions" on page 141](#)
- ["Viewing Alerts and Notifications" on page 146](#)

Introduction

Ivanti Neurons for Secure Access Admin portal provides visibility of user activity and service usage across your Ivanti Connect Secure Gateways in your enterprise through network activity analytics, gateway performance graphs, application usage metrics, and stored activity logs.

Through the Ivanti Connect Secure menu, use the **Insights** menu icon to:

- View the common analytics charts/tables of nZTA and nSA on a new unified landing page, see ["Consolidated Landing Page" on the next page](#).
- View graphs, metrics, and logs concerning all users activities, see ["Reviewing Users Activity" on page 83](#).
- View graphs, metrics, and logs concerning to individual user activities, see ["Reviewing Individual User Activity" on page 105](#).

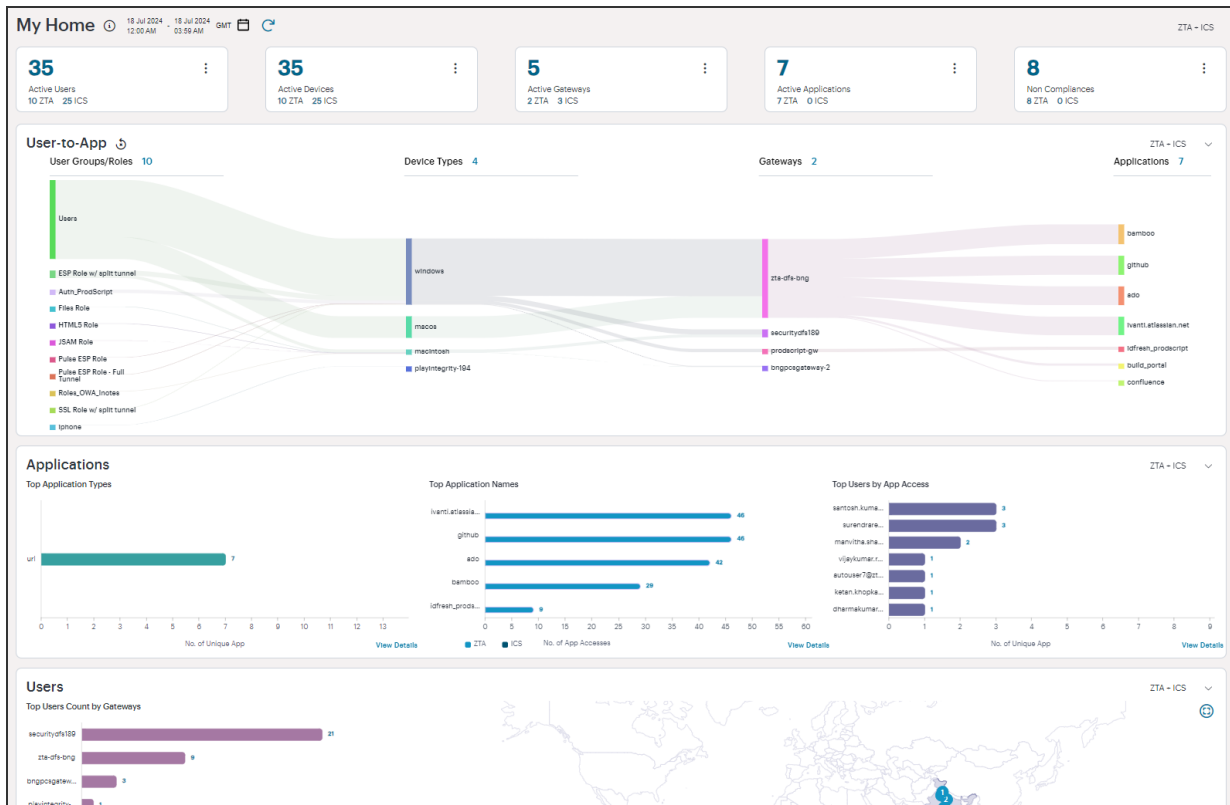

- See details and usage of applications configured in your Ivanti Connect Secure service, see ["Reviewing Application Usage" on page 93](#)
- View graphs, metrics, and logs concerning to all gateways status and versions, see ["Reviewing Gateways Status and Versions" on page 111.](#)
- Configure certain actions based on different types of Insights, see ["Configuring Actionable Insights" on page 131](#)

Ivanti Connect Secure provides both a light theme and a dark theme for the UI display.

Consolidated Landing Page

After you log in to the Tenant Admin Portal following successful completion of the *Onboarding Wizard*, nZTA displays the **Home** page. This page presents the common analytics charts/tables and sankey chart of nZTA and nSA on a new unified landing page. Use the drop-down selection option to view nZTA only, ICS only, or nZTA+ICS charts.

Understanding the Display

The primary components of the My Home page are the following:

- **Filter bar**, allowing the selection of active or historic data. For details, see ["Using the Filter Bar" on page 56](#).
- **Summary ribbon**, showing totals for active **Users**, **Devices**, **Gateways**, **Applications** and **Non Compliances**. Click on numbers which opens table view. In the table view, click the appropriate button to navigate to the respective analytics page, for example click on **Go to ZTA Gateways** opens Gateways Overview page.

Rows per page: 10
1 - 10 of 1847 found.

In this page:

- Where a specific data item in the event table is truncated due to the column width, hover your pointer over the item to view a tooltip containing a full-length description. You can also re-size the width of any column by dragging the column.
- Select the name of a column to apply a sort by that criteria. The adjacent arrow shows either ascending or descending sort order, or no sort - select again to switch between each view.
- To move a column, click the header of the column and drag it to a desired new position.
- To copy a log's column content, double click on the column content and press ctrl-c. If the content has multiple words, for example log message column, then triple click and press ctrl-c. To paste the content elsewhere, press ctrl-v.

Reviewing Your Network Activity

The *Network Overview* page shows real-time analytics data for your application infrastructure, providing a one-page dashboard of activity across your organization.

To access the **Network Overview** page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).

The *My Home* page appears by default.

2. Click the **Insights** menu icon and then click **Overview**. Alternatively, click the "Ivanti Neurons for Secure Access" banner at the top.

Ivanti Connect Secure provides bread-crumb navigation for all *Insights* pages at the top.

Understanding the Display

The primary components of the **Network Overview** page are the following:

- **Filter bar**, allowing the selection of active or historic data, and filtering by Gateway. For details, see ["Using the Filter Bar" on the next page](#).

- **Summary ribbon**, showing totals for **All Gateways, Active Gateways, Users, Devices, Sessions, Applications, Non-Compliances, Auth Failures**, and **Anomalies**. For more details, see ["Viewing the Network Summary Ribbon" on page 58](#).
- **Switchable World Map and Sankey chart**, showing active Gateways locations and Users locations:
 - In the world map view, each Gateway location and User location provides a summary of the activity observed there. For more details, see ["Using the World Map" on page 66](#).
 - In the Sankey chart view, you can view the relationships between user groups, device types, and Gateways. For more details, see ["Using the Sankey Chart View" on page 74](#).
- **Radar charts**, providing top usage data for **Gateways, Device Types**, and **User Locations**. For more details, see ["Using the Top Active Breakdown Charts" on page 80](#)
- **Bar chart** breakdowns showing **Sessions, Non-compliances, Connected Clients Version** and **Pre-auth Non-Compliances** activity. For more details, see ["Using the Sessions, Non-Compliances, Connected Clients Version and Pre-Auth Non-Compliances Charts" on page 75](#).

The data in this page refreshes automatically every 5 minutes.

With each chart, click the **View all** link to view detailed log records for that category.

The following principles apply to all elements of the page:

- A user can have one or more devices.
- Each device can have one or more active secure access sessions on multiple gateways.
- One session can connect to multiple applications.
- One session can be associated with multiple Gateways.
- One Gateway can have multiple applications registered with it.

Using the Filter Bar

Ivanti Connect Secure uses the top part of the display on all **Insights** data analysis pages to show the current page title, the default time period, and options to:

- Manually refresh the data
- Filter analytics data for a specific Ivanti Connect Secure gateway

- Select the date and time period for which data is displayed.

By default, analytics data on all pages is shown for the last hour. To select a previous or specified time period, select the date-time display (indicated):

The screenshot shows a date-time selection dialog. On the left, under 'Active', there are predefined time periods: 'Last 4 hours', 'Previous day', 'Previous week', and 'Custom' (which is highlighted in blue). On the right, there are 'From' and 'To' date/time pickers. Both are set to '09 Oct 2023' with a time of '03:48 AM' for 'From' and '04:48 AM' for 'To'. The time zone is 'GMT'. Below the date pickers are 'HR' and 'MIN' dropdowns for both 'From' and 'To'. The 'From' time is 3:52 and the 'To' time is 4:52. At the bottom are 'RESET', 'CANCEL', and 'APPLY' buttons.

Selecting a date and time range

In the date-time selection dialog, choose from the following predefined time period options:

- **Last hour:** Data observed for the previous 60 minutes.
- **Last <X> hours:** Data observed so far in the current day, up to the last hour (in GMT).
- **Previous day:** Data observed for the previous full day.
- **Previous Week:** Data observed for the previous calendar week (for the previous full Sunday-to-Saturday week).
- **Custom:** Data observed for a chosen time period. If you select this option, *nZTA* enables you to select a custom time period using the **From** and **To** date/time calendar controls.

The date/time calendar controls are enabled for only the **Custom** option. However, the calendar continues to identify the applicable start and end date-time for all predefined time periods.

To reset the selected time period back to the default (*Last Hour*) view, select **Reset**. To return to the current page without making any changes, select **Cancel**.

To apply your changes, select **Apply**. The selected time period is displayed in the filter bar and data across all **Insights** pages is updated accordingly.

The data in the display refreshes automatically at 5 minute intervals. To manually refresh the data, click the circular arrow:

Ivanti Connect Secure provides the ability to show focused metrics for a specific Ivanti Connect Secure Gateway. To select a specific gateway, use the filter icon:

In the Filter panel, from the drop-down list select the required gateway and click **Apply**. To clear the selection, click **Clear All**.

Viewing the Network Summary Ribbon

The Summary ribbon at the top of the page shows data totals for the selected time filter:

The ribbon indicates the totals accrued for each category during the displayed time period, as indicated adjacent to the category name.

The following categories are provided in the ribbon:

- Total number of Gateways (**All Gateways**). The count of all gateways added to the controller, regardless of their status (registered, unregistered, offline, or online).
 - **Active View**: Captures the count of gateways added on the controller.
 - **Historic View**: Captures the count of gateways from where the health status such as memory, CPU etc. are received in the selected timeframe.
- The number of **Active Gateways**. The count of gateways through which there is user traffic within the selected window, regardless of the current status of the notification channel.
- The number of **Active Users**.
- The number of **Active Devices**.
- The number of **Active Sessions**.
- The number of **Active Applications**.
- The number of **Non-compliances**. In other words, non-compliant attempts to access your applications. For the default time period filter, non-compliance totals shown here are for 24 hours. For other selected time periods, the number reflect the total for that period.
- For the default time period filter, **Auth Failures** totals shown here are for 24 hours. For other selected time periods, the number reflect the total for that period.
- The number of **Anomalies** detected by Ivanti Connect Secure. That is, the total number of geographic anomalies. For the default time period filter, anomaly totals shown here are for the previous 30 days, and include only unacknowledged anomalies. For other selected time periods, this total includes both acknowledged and unacknowledged anomalies.

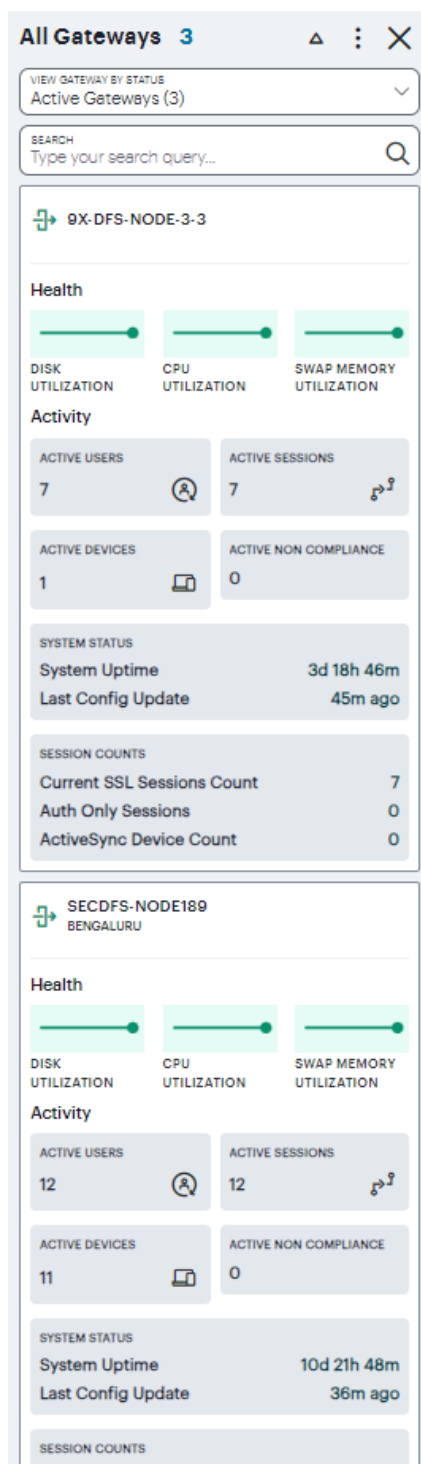

If you are currently viewing data for the *last hour*, each category in the ribbon includes a trend graph (highlighted, top) showing the changes in data during the hour. Also included is a change value (highlighted, bottom) based on the previous hour:

In the default *last hour* view, while data for Active Gateways, Users, Devices, Sessions and Applications is shown as such, Non-Compliances and Auth Failures are shown for the previous 24 hours, and anomalies are shown for the previous 30 days. This is as indicated against the Category name.

Additional trend indicators are present for the *last hour* time period only. Trends are not applicable when any filter is applied (intent or gateway).

If you click on any of the categories in the ribbon, Ivanti Connect Secure displays a sliding info-panel dialog showing more details for that category. For example, if you click on the **Active Gateways** category, a panel appears showing the list of active Gateways. In this case, a summary box is displayed for each Gateway showing statistics relevant to that instance, such as the number of active users, active sessions, active devices, non-compliance events, system status such as the system uptime, last config update, session counts such as current SSL sessions count, auth-only sessions, ActiveSync device count.

This version of the info-panel shows details for *all Gateway locations*. To view an info-panel for a single Gateway location, click the Gateway location bubble in the world map. For more details, see ["Using the World Map" on page 66](#).

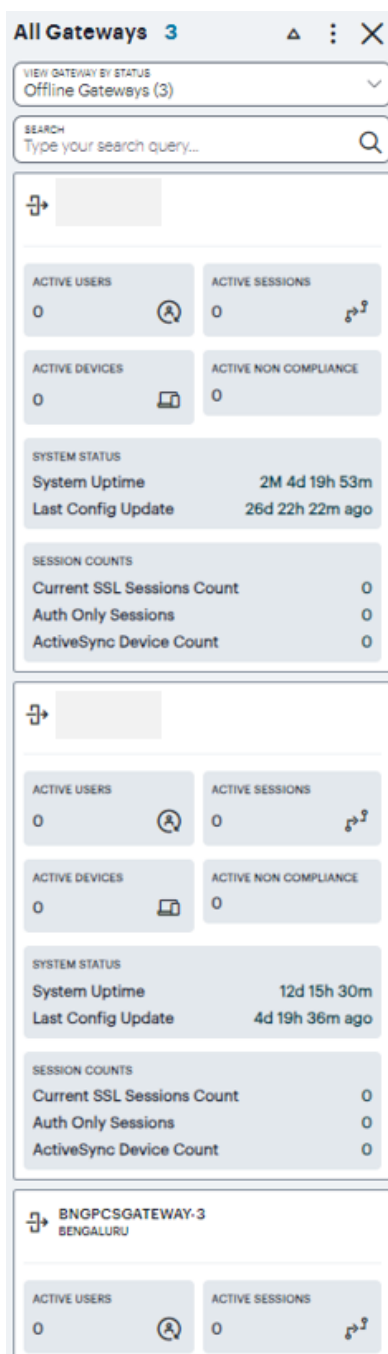

For the *Active Gateways* info-panel, use the **View Gateway by Status** drop-down list to change the type of Gateways displayed in the panel. Choose from:

- **All Gateways:** All Gateways regardless of status.
- **Active Gateways:** All active Gateways. That is, only Gateways that have active sessions. This is the default view.
- **Offline Gateways:** All offline or unregistered Gateways. That is, only Gateways that are unresponsive or not yet registered with the Ivanti Neurons for Secure Access.
- **Online Gateways:** All online Gateways. That is, all Gateways that are registered with the Ivanti Neurons for Secure Access.

The number of instances of each type is given in brackets.

For example, by selecting *Offline Gateways*, the panel updates as follows:

Use the **Search** bar at the top to filter the results list. For example, to show only those Gateways that match a search string. To clear your search, click **CLEAR SEARCH RESULTS**.

To learn more about the meaning of the different indicator colors used in the info-panel, see ["Understanding the Display" on page 53](#). Hover your pointer over the instance health indicators to display a tooltip showing more specific details and values.

Click on any Critical or Warning notification banner to display a drop-down summary of the issues:

You can click on each entry to obtain more details and logs concerning the issue.

For the Active Users info-panel, Ivanti Connect Secure displays an *average UEBA threat score*. To learn more about UEBA threat scores, see ["Viewing a Summary of UEBA Threat Scores for your Users" on page 88](#)

For Non-Compliance and Anomalies info-panels, summaries are displayed on a per-user basis, with the reason for the event shown.

To change the sort order of the items displayed in the info-panel, use the *Sorting* controls at the top:

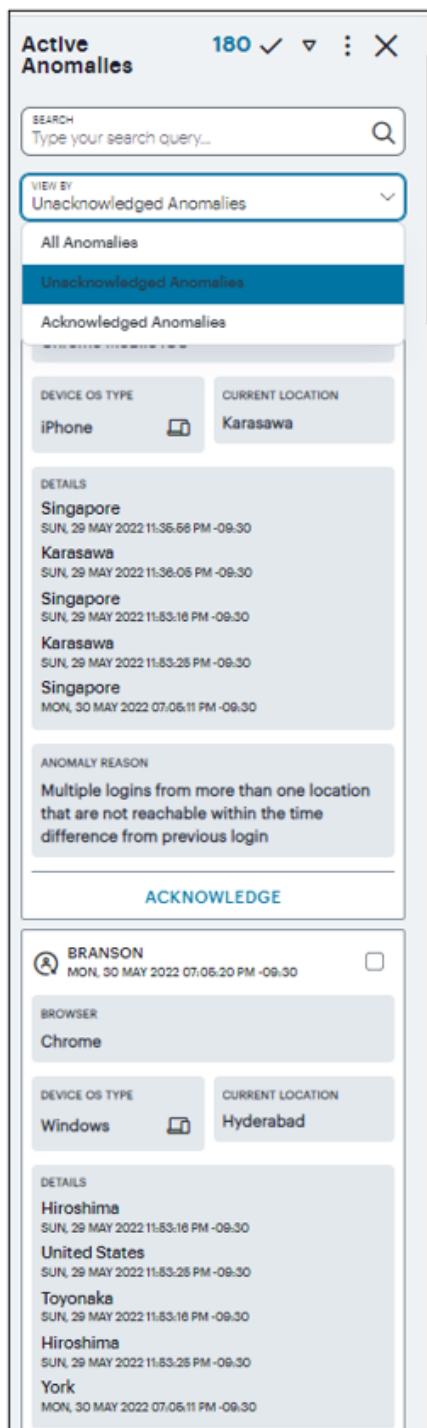

Use the *dots* icon to select the sort criteria, then use the *arrow* icon to toggle between ascending and descending order. The sort criteria varies depending on the category chosen, and is based on the statistics shown for each item. For example, by selecting the **Gateways** info-panel, you can choose the display order for your Gateways based on the following statistics:

- Active Users
- Non-Compliances
- Active Devices
- Number of Issues
- Gateway Name
- City Name

A tick identifies the currently chosen criteria.

For **Anomalies**, the info-panel lists Unacknowledged and Acknowledged anomalies, and provides additional functionality to enable you to *Acknowledge* individual Unacknowledged anomalies.

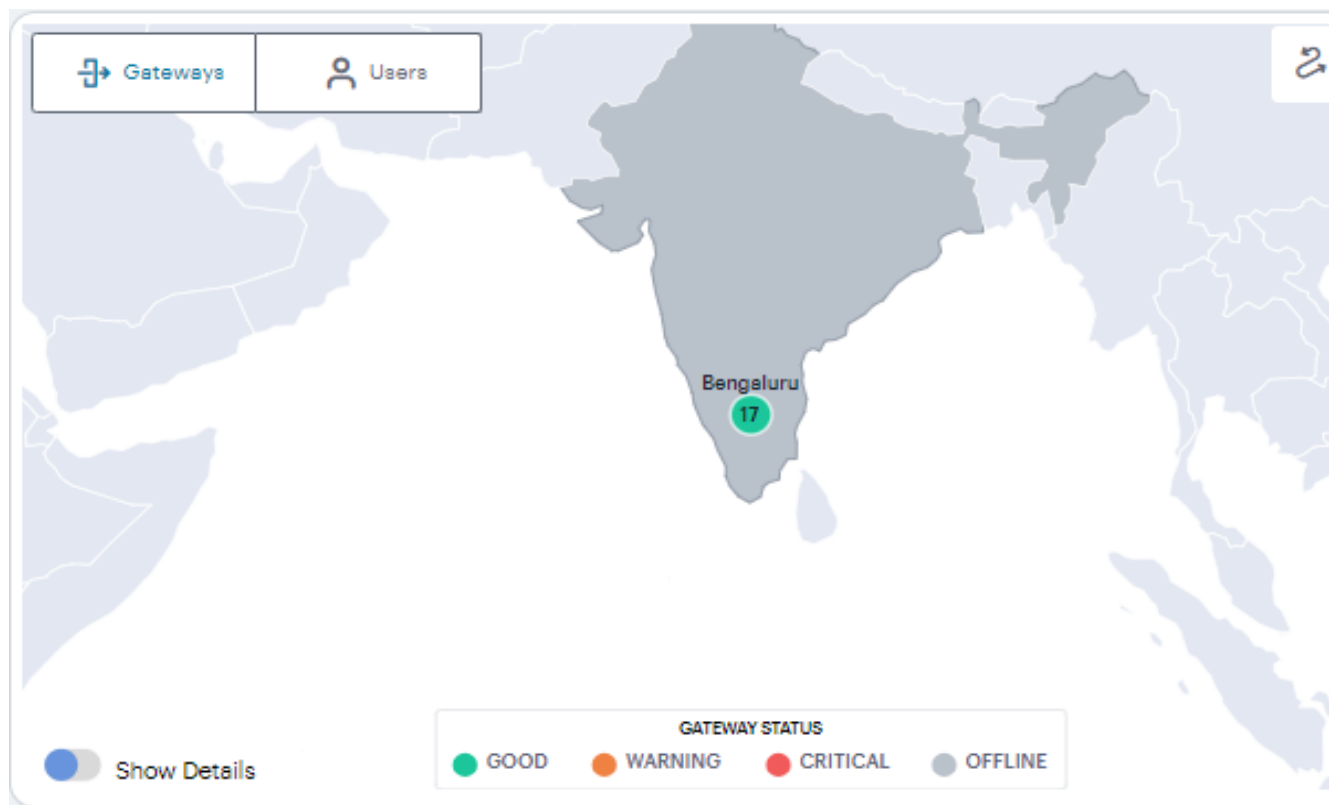

Each box in the info-panel lists a user and the active anomalies connected to them. For each user, from the Unacknowledged anomalies list, click **ACKNOWLEDGE** to remove this anomaly from the list.

Alternatively, use the *tick* icon and check boxes adjacent to each user name to acknowledge multiple, or all, anomalies in a single action. Note that when the default "active" time period filter is selected, the anomalies count in the Summary ribbon decreases by 1 for each acknowledgment.

For the **Gateways** info-panel, click a Gateway name to access the corresponding *Gateways Overview* page that provide usage metrics or configuration details for that item.

Using the World Map

The Map view contains Gateways and Users tabs. Your Gateways locations are presented on the map as a series of geographically-placed counters, with each counter depicting a location, the status of the services held there, and the number of Gateways. To learn more about the colors used to indicate service status, see ["Understanding the Display" on page 53](#)

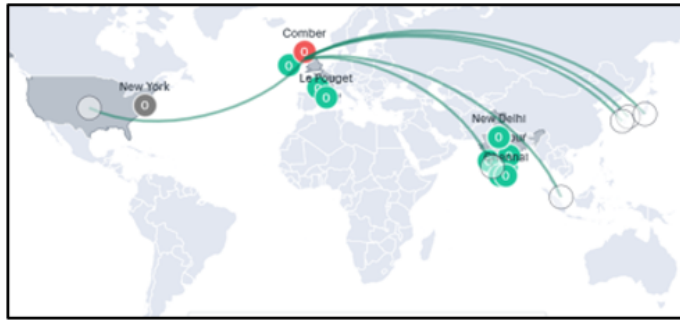

Use the Plus (+) and Minus (-) controls to zoom in and out of the world map, allowing you to select the desired level of detail. Alternatively, use your pointer to manipulate the map display. Double-click/tap an open area of the map to zoom in, or reposition the map display through drag and drop.

To toggle between the Map view and Sankey chart view, use the icons at the top-right:

The data shown is representative of the currently-selected time period, and by default shows *active* data (for the previous 1 hour). To learn more about setting time periods for the displayed data, see ["Using the Filter Bar" on page 56](#).

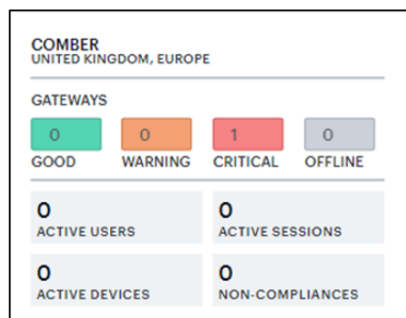

To learn more about network usage or alerts at a particular location, hover your pointer over the location identifier. It shows the active user sessions established from that Gateway location to other Gateway locations.

By turning on the **Show Details** switch located at the bottom-left of the map, and by hovering on a Gateway location, the current Gateway status is indicated by the color scheme shown in the legend.

To learn more about the meaning of the different indicator colors used in the map and panels, see ["Understanding the Display" on page 53](#)

To expand the current view, click the Full Screen icon:

In the expanded view, the Gateway Status pop-up summary panel is expanded to include more details concerning usage at that location:

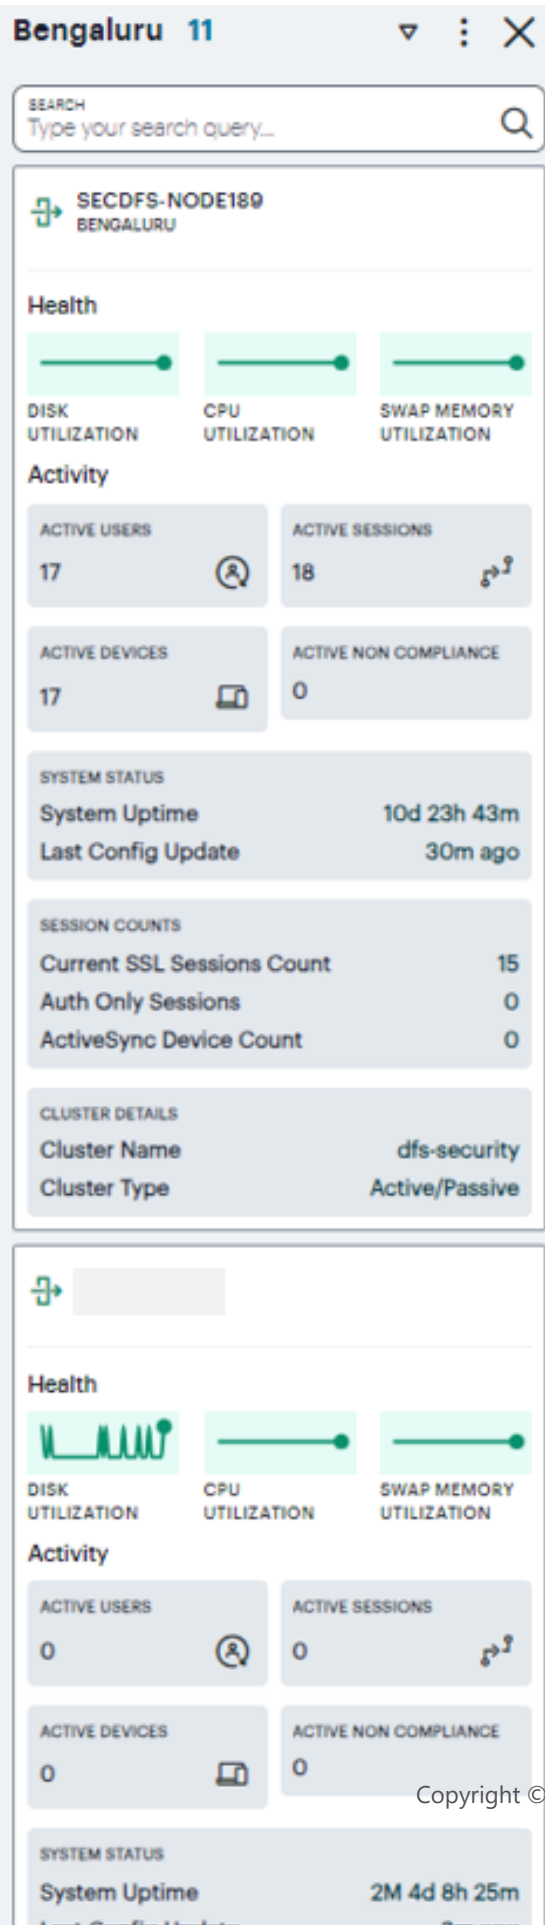

In addition to the status indicator, this version of the summary panel shows the following statistics:

- **Active Users:** The number of unique users that have sessions through Gateways at the location (as also indicated in the location bubble)
- **Active Sessions:** The number of sessions accessed through Gateways at the location
- **Active Devices:** The number of unique devices that have sessions through Gateways at the location
- **Non-Compliances:** The number of active non-compliant sessions (full/partial non-compliant) in this location

Click the Full Screen icon again to return to the standard view.

In both views, click a location bubble to display a sliding info-panel dialog for the Gateways at that location.

Use this info-panel to view health and usage statistics for the location, with further details concerning any reported problems with the deployed Gateways. The panel displays the following details:

- **Location name and number of Gateways:** The descriptor for this location and the number of Gateway instances deployed there.
- **Active Users:** The number of unique users that have sessions through Gateways at the location (as also indicated in the location bubble).
- **Active Sessions:** The number of sessions accessed through Gateways at the location.
- **Active Devices:** The number of unique that have sessions through Gateways at the location.
- **Non-Compliance:** The number of active non-compliant sessions (full/partial non-compliant) in this location.
- **System Status:** The system uptime and the time since the last config update.
- **Session Counts:** The number of current SSL sessions, number of auth only sessions, and the number of ActiveSync devices.
- **Cluster Details:** The cluster name, type, and node details.

This view of the info-panel displays data for a *single* Gateway location. To view an info-panel showing data for *all* Gateway locations, click the Gateways category in the Summary ribbon. To learn more, see ["Viewing the Network Summary Ribbon" on page 58](#).

When displaying active data, all non-compliance and unacknowledged anomaly totals are displayed for the previous 24 hours.

To learn more about the information and controls contained in the info-panel, see ["Viewing the Network Summary Ribbon" on page 58](#).

Understanding Gateway Status Indicator Colors

In the world map view, your current Gateway status is indicated by the color scheme shown in the legend:

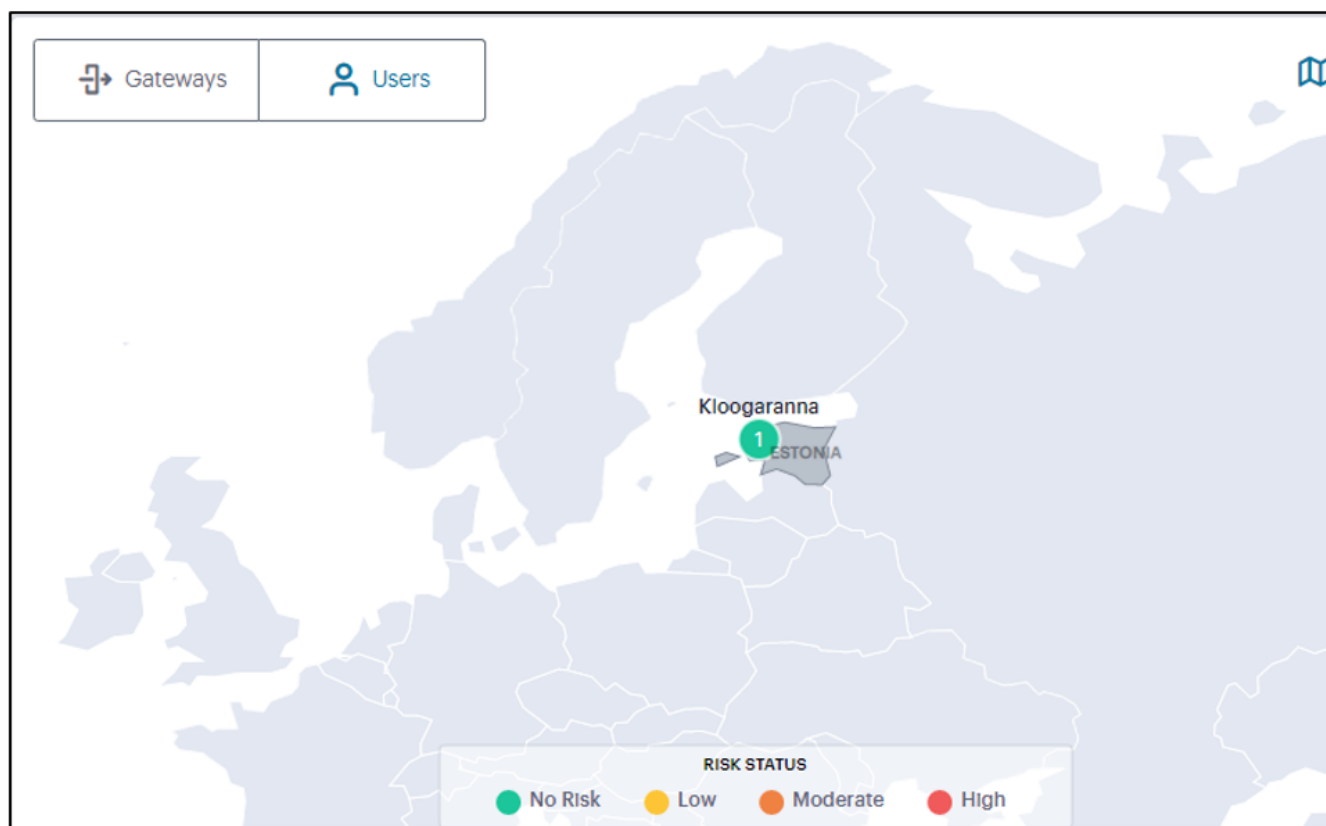

- **Good (Green):** All Gateways are functioning normally.
- **Warning (Amber):** One or more of the Gateways at that location is experiencing a *warning* scenario. This status is triggered by the occurrence of any one of the following conditions:
 - Gateway device CPU usage is within the range 80% - 90%
 - Gateway device swap memory usage is within 10% - 50%
 - Gateway device disk usage is within the range 80% - 90%
- **Critical (Red):** One or more of the Gateways at that location is experiencing an *critical* alert scenario. This status is triggered by the occurrence of any one of the following conditions:
 - Gateway device swap memory usage is greater than 50%
 - Gateway device disk usage is greater than 90%
 - At least 1 critical error has been reported
- **Offline (Grey):** All offline or unregistered Gateways. That is, only Gateways that are unresponsive or not yet registered with the Ivanti Neurons for Secure Access.

Furthermore, counters in the *Summary ribbon* use the following color scheme to reflect status:

- **Red:**
 - **Users:** at least one user has anomalies in the selected duration
 - **Devices:** at least one active device is non-compliant in the selected duration
 - **Gateways:** as described above
 - **Non-compliance:** if the count is non-zero
 - **Anomalies:** if the count is non-zero

Users Map View

In the world map **Users** tab, each location shows the number of active users in that location.

Use the Plus (+) and Minus (-) controls to zoom in and out of the world map, allowing you to select the desired level of detail. Alternatively, use your pointer to manipulate the map display. Double-click/tap an open area of the map to zoom in, or reposition the map display through drag and drop.

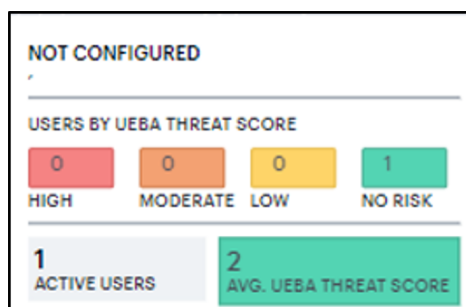

To toggle between the Map view and Sankey chart view, use the icons at the top-right:

The color of the location shows the average UEBA Threat scores of the active users in that location:

- **Green (No Risk)** - UEBA Threat score < 10
- **Yellow (Low)** - UEBA Threat score > 10 < 20
- **Orange (Medium)** - UEBA Threat score > 20 < 30
- **Red (High)** - UEBA Threat score > 30
- Hover on a user location to view detailed UEBA Threat scores of the users in that users location.

By hovering on a User location, the current Users' status is indicated by the color scheme shown in the legend.

Click a location bubble to display a sliding info-panel dialog for the Users at that location.

- Average UEBA Threat score
- Anomalies
- Alerts count

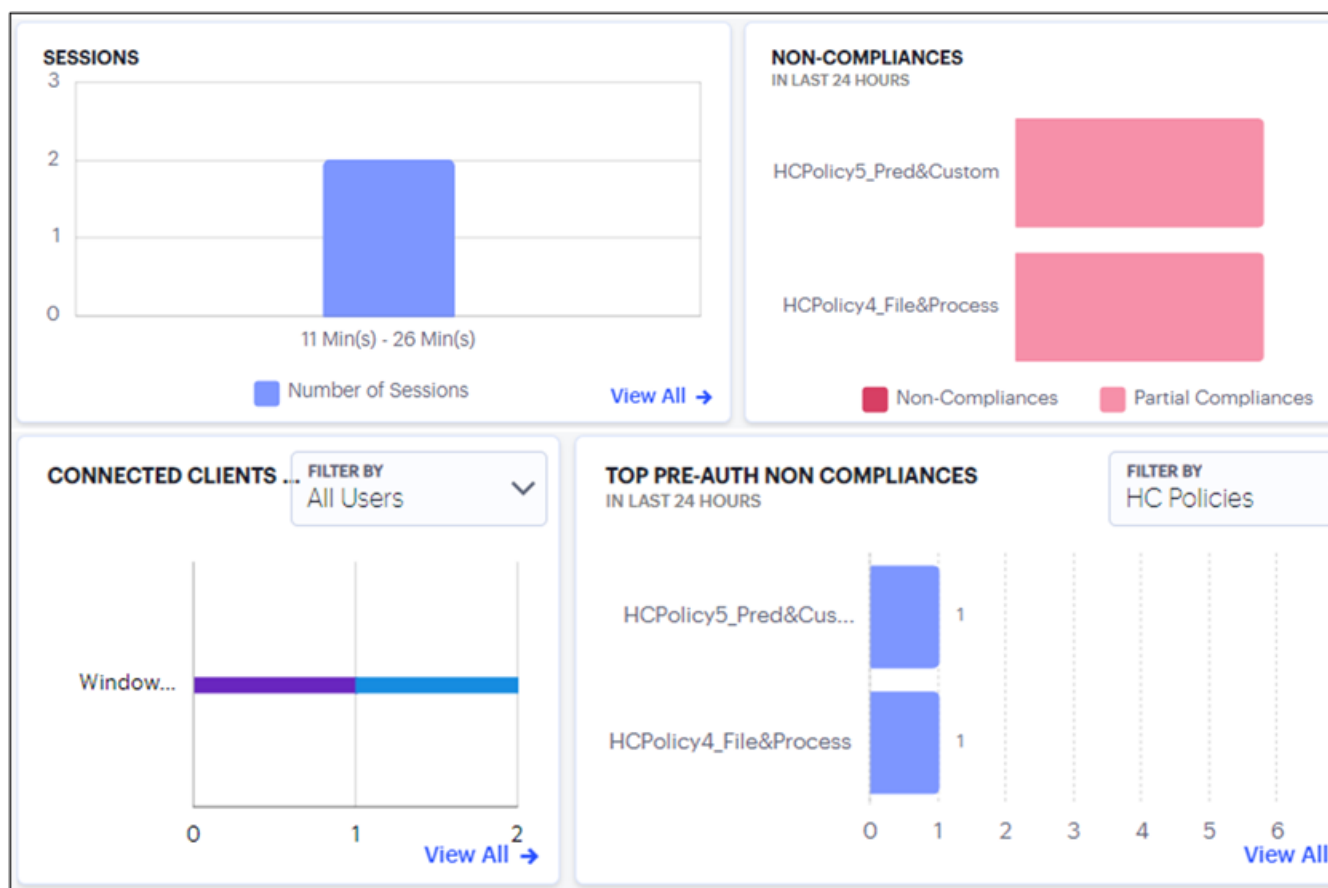

Using the Sankey Chart View

The Network Sankey chart provides an alternate visualization of your services, showing directed flow between related objects. The width of each stream in the flow is proportional to the utilization of the object the flow passes through, allowing an administrator to view significant usage and relationships across your user base and application infrastructure.

To activate the Sankey chart view, use the toggle icons at the top-right:

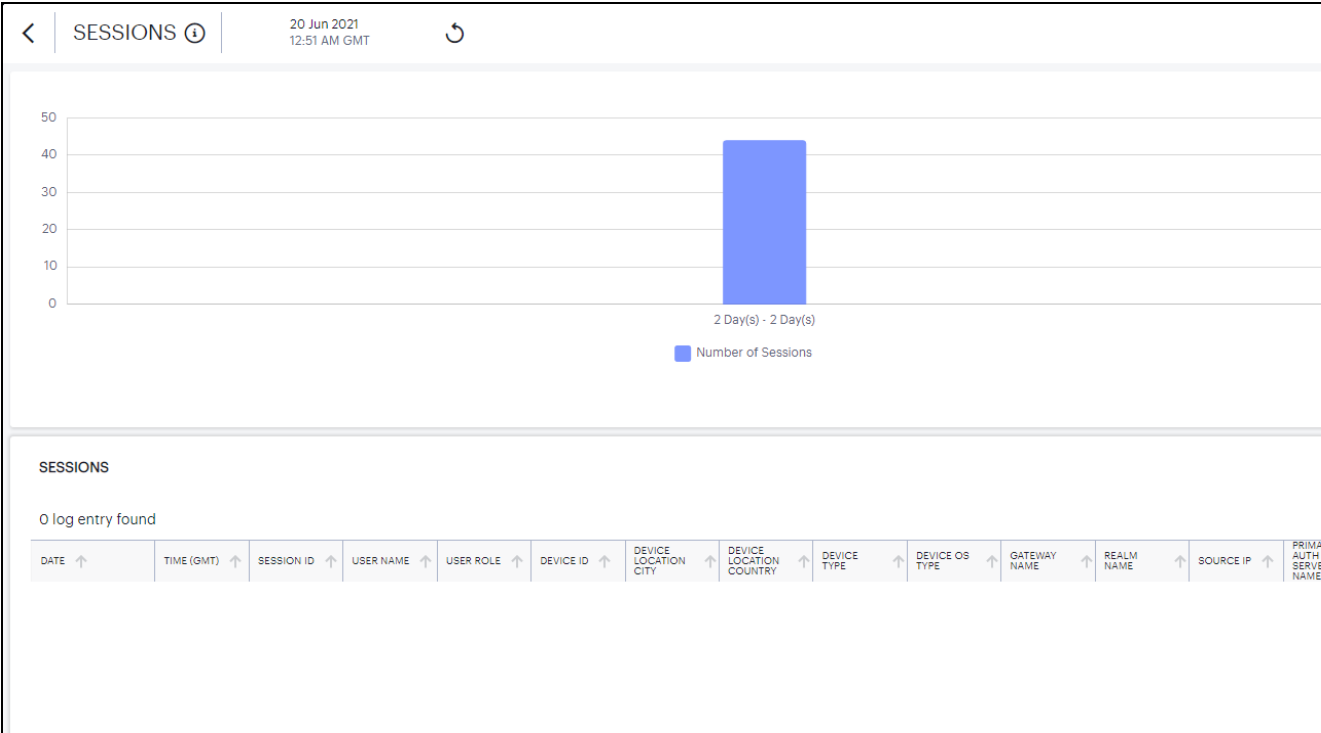

By clicking the toggle display icon, the Sankey chart replaces the world map in the display. All other components remain unchanged.

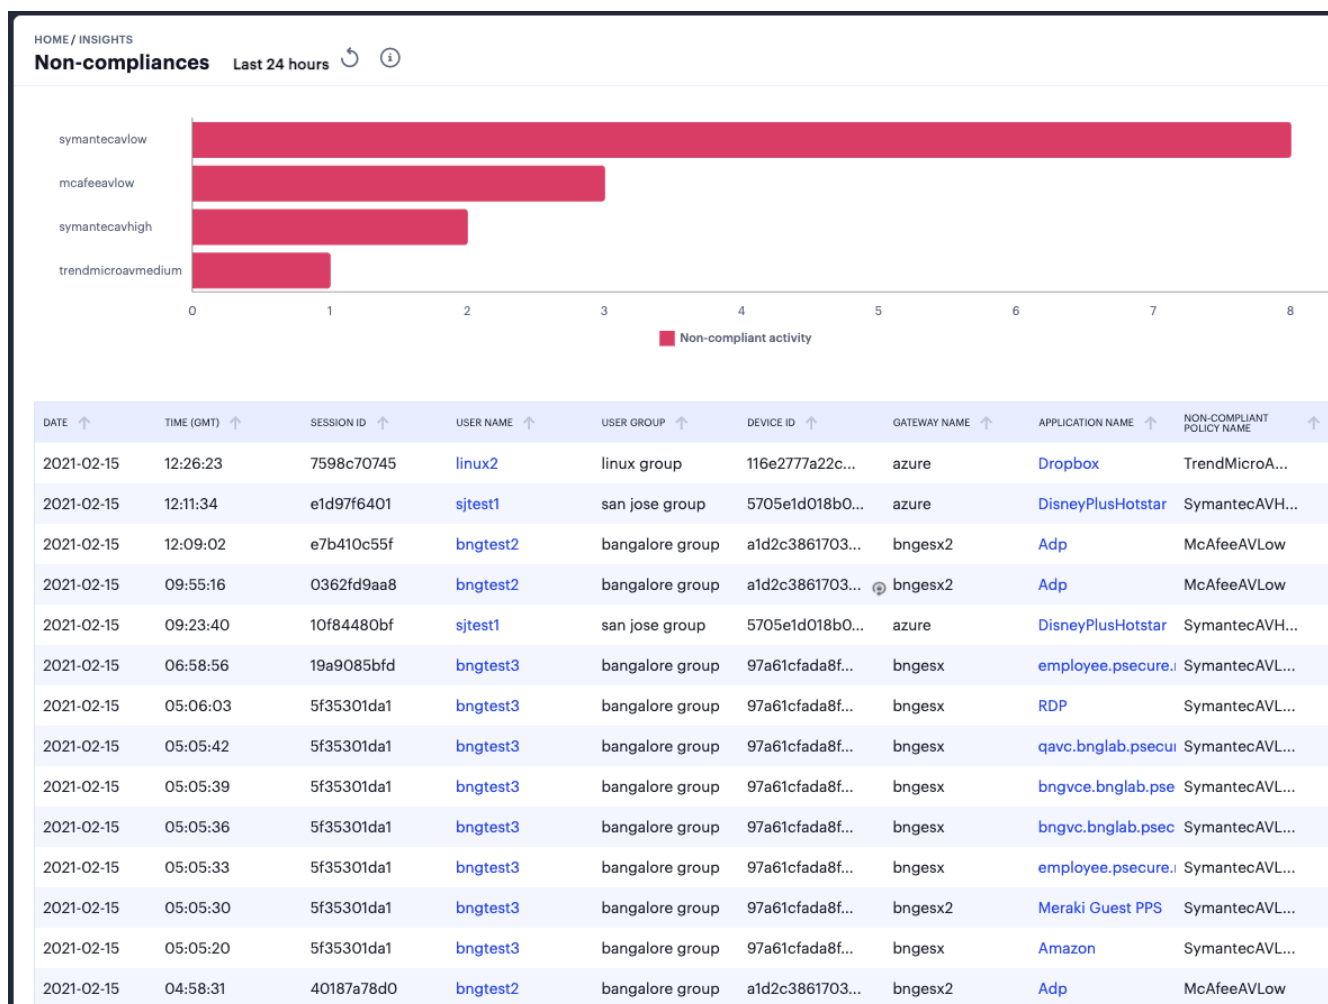

The **Sessions** chart provides the total number of sessions over a period. That is, user sessions that took place during the period.

To view a detailed list of events that contributed to the totals, click **View all**:

The **Non-compliances** chart provides a breakdown of non-compliant device activity that contravened a configured device policy. Totals are given for the highest policy contraventions recorded during the period.

To view a detailed list of events that contributed to the totals, click **View all**:

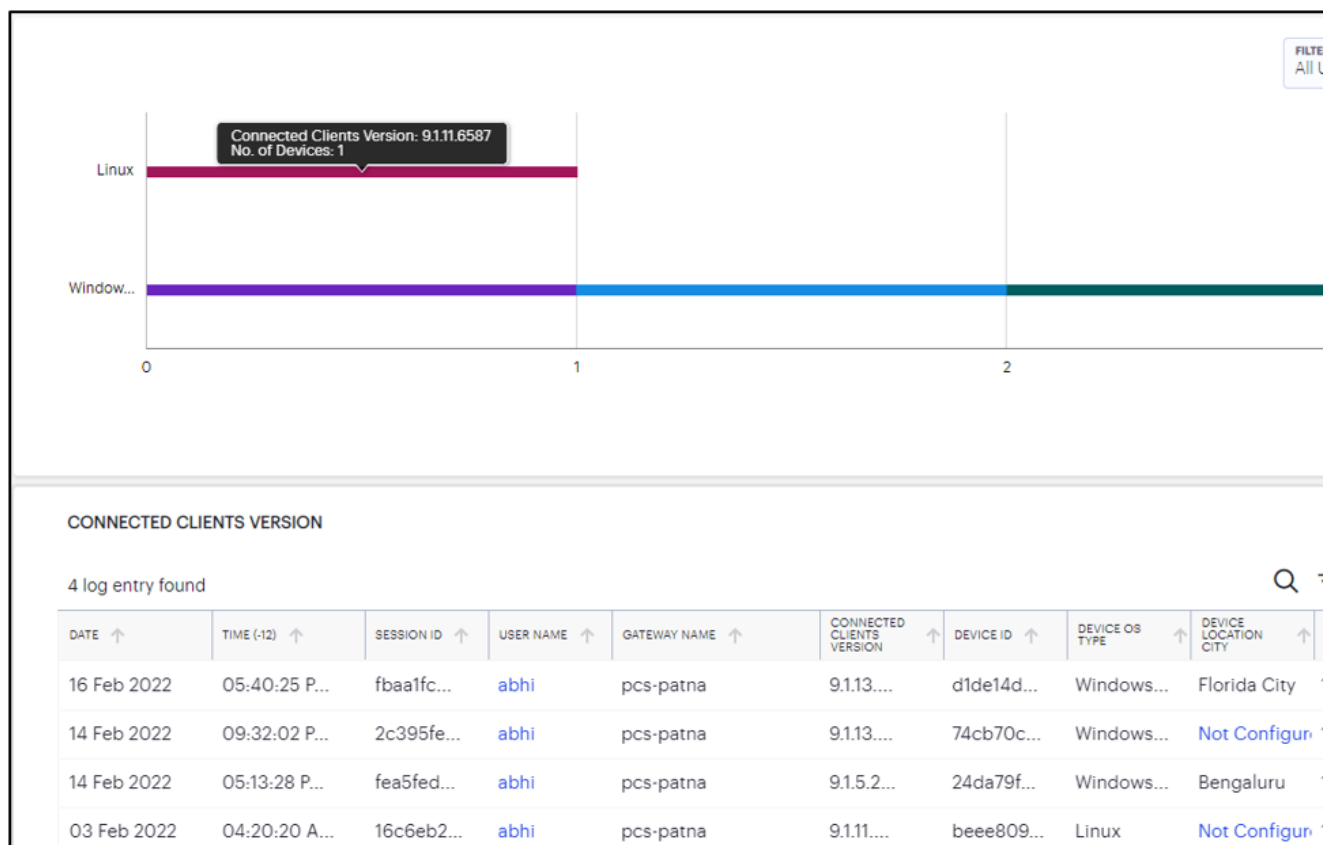

Click on the legend labels to toggle that element on or off in the chart. Use your pointer to scroll the event messages pane to view more details in the columns to the right.

The **Connected Clients Version** chart provides the distribution of various versions of Ivanti Secure Access client across different device OS in the tenant.

You can view the chart based on *Active Users* for Ivanti Secure Access client versions distribution from the currently active sessions or *All Users* for Ivanti Secure Access client versions distribution from the sessions in the last 30 days.

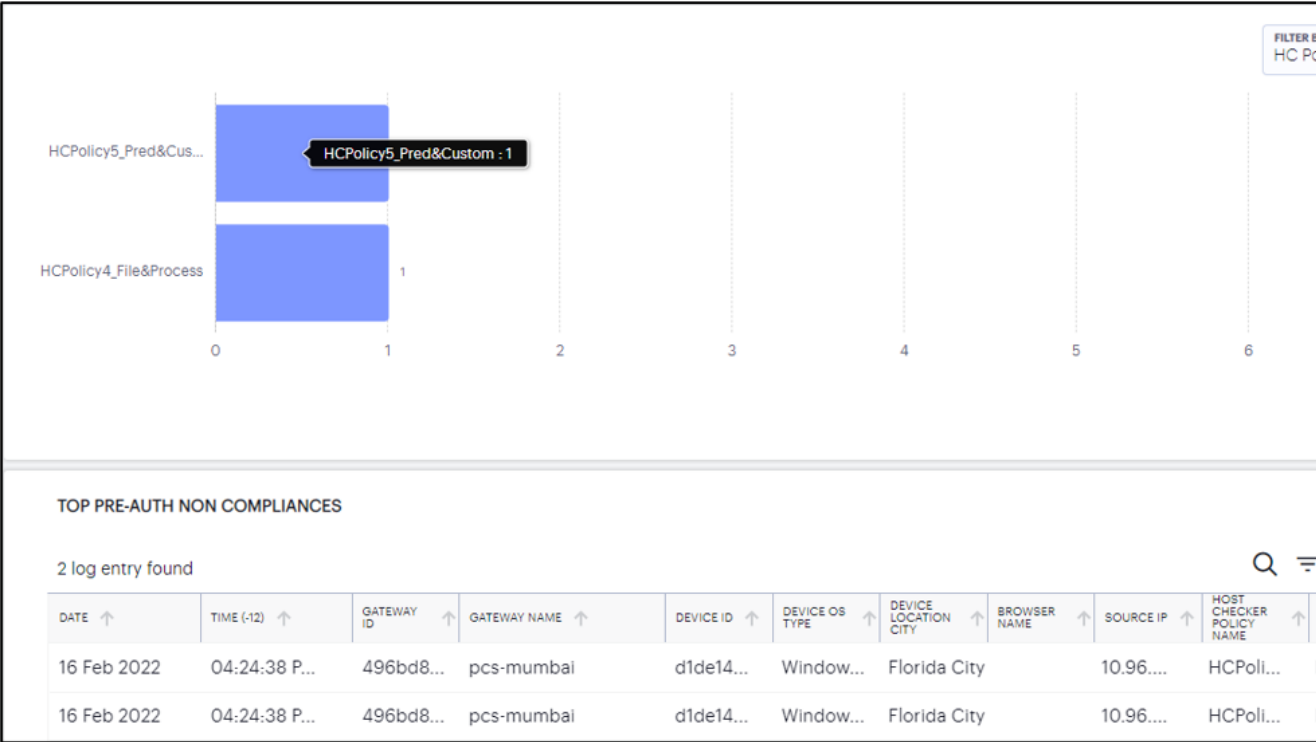

To view a detailed list of events that contributed to the totals, click **View all**:

The **Pre-Auth Non-Compliances** provides the occurrences of non-compliance in the last 24 hours, in the tenant even before the authentication.

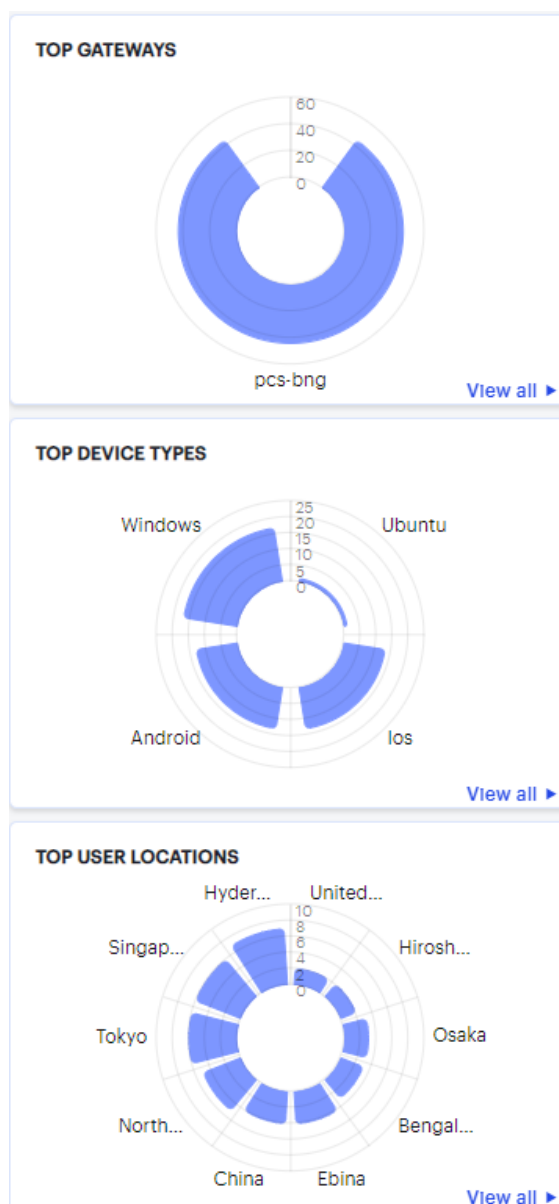

You can view the chart based on *Device Types*, *User Locations*, *Gateways* and *HC Policies*.

To view a detailed list of events that contributed to the totals, click **View all**:

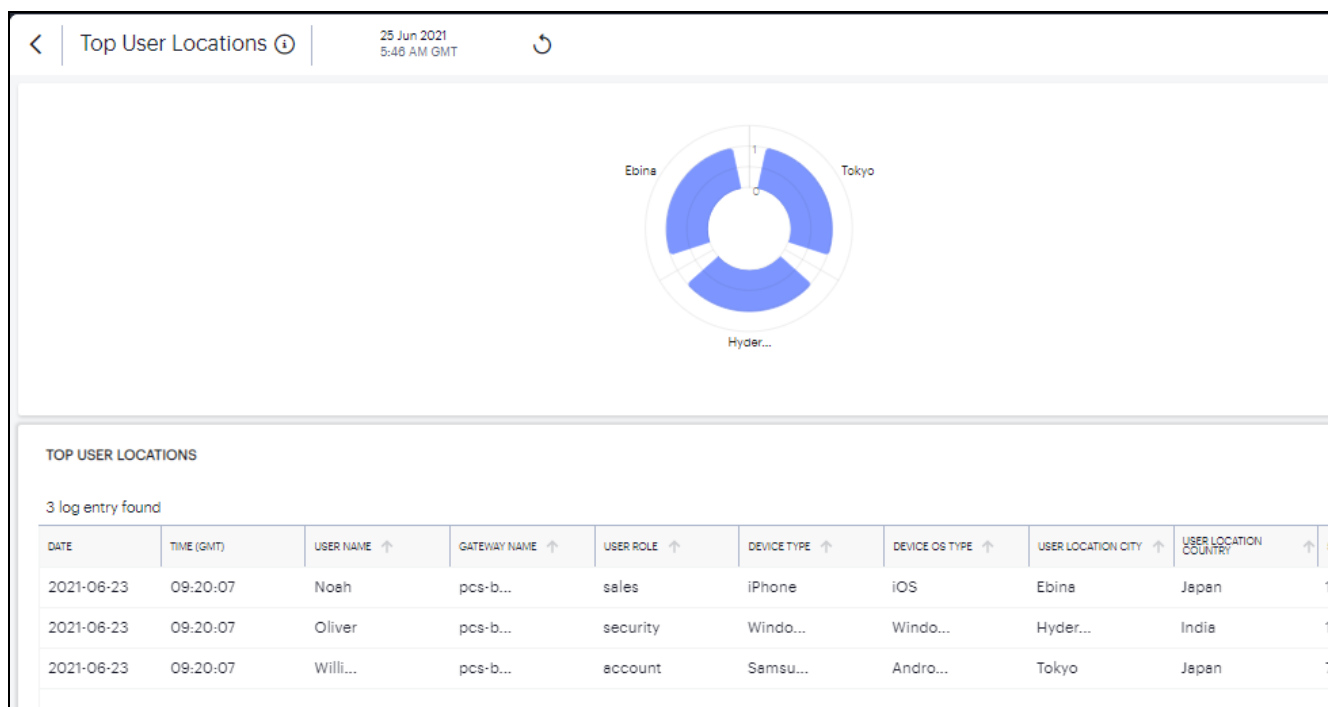

Using the Top Active Breakdown Charts

The *radar* charts at the bottom of the page show a breakdown of **Gateways**, **Device Types**, and **User Locations** across your organization. Each chart shows the *top active items* in each category.

Hover your pointer over a particular element to view a tooltip showing the label and total. To view more details for a chart, click the corresponding **View all** link. For example:

Click the **View All** link that provides access to a detailed view showing logs for the corresponding chart.

In the detailed log page:

- Double-click on any log to view additional details of that log in the Info Panel to the right.
- Use the Group by option and select the field type to view the table information in groups. Then click > to view the logs in that group.

- Where a specific data item in the event table is truncated due to the column width, hover your pointer over the item to view a tooltip containing a full-length description. You can also re-size the width of any column by dragging the column.
- To move a column, click the header of the column and drag it to a desired new position.
- To copy a log's column content, double click on the column content and press **ctrl-c**. If the content has multiple words, for example log message column, then triple click and press **ctrl-c**. To paste the content elsewhere, press **ctrl-v**.
- Use the Advanced Filter icon to view logs based on the pre-defined filter, operator and value. To learn more, see ["Filtering the Logs" on page 123](#).

Reviewing Users Activity

The *Users Overview* page shows activity relating to users in your Ivanti Connect Secure deployment.

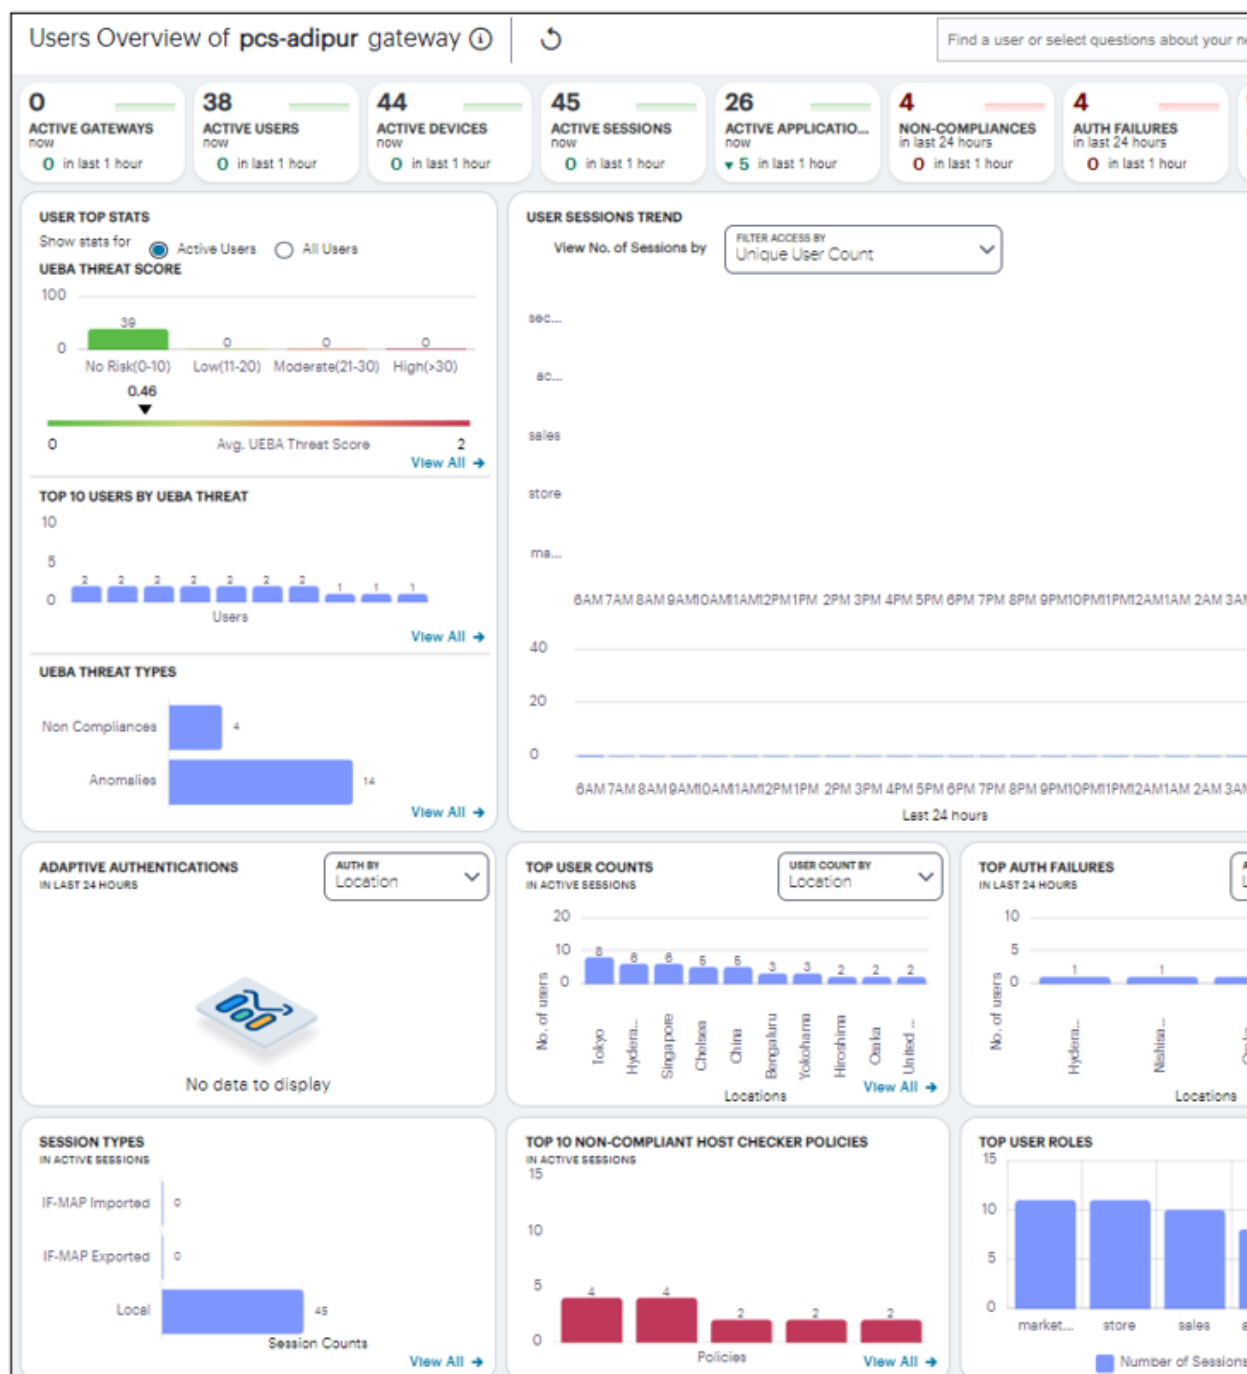

To access the *Users Overview* page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24,.

The *My Home* page appears by default.

- From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Users**.

The *Users Overview* page appears.

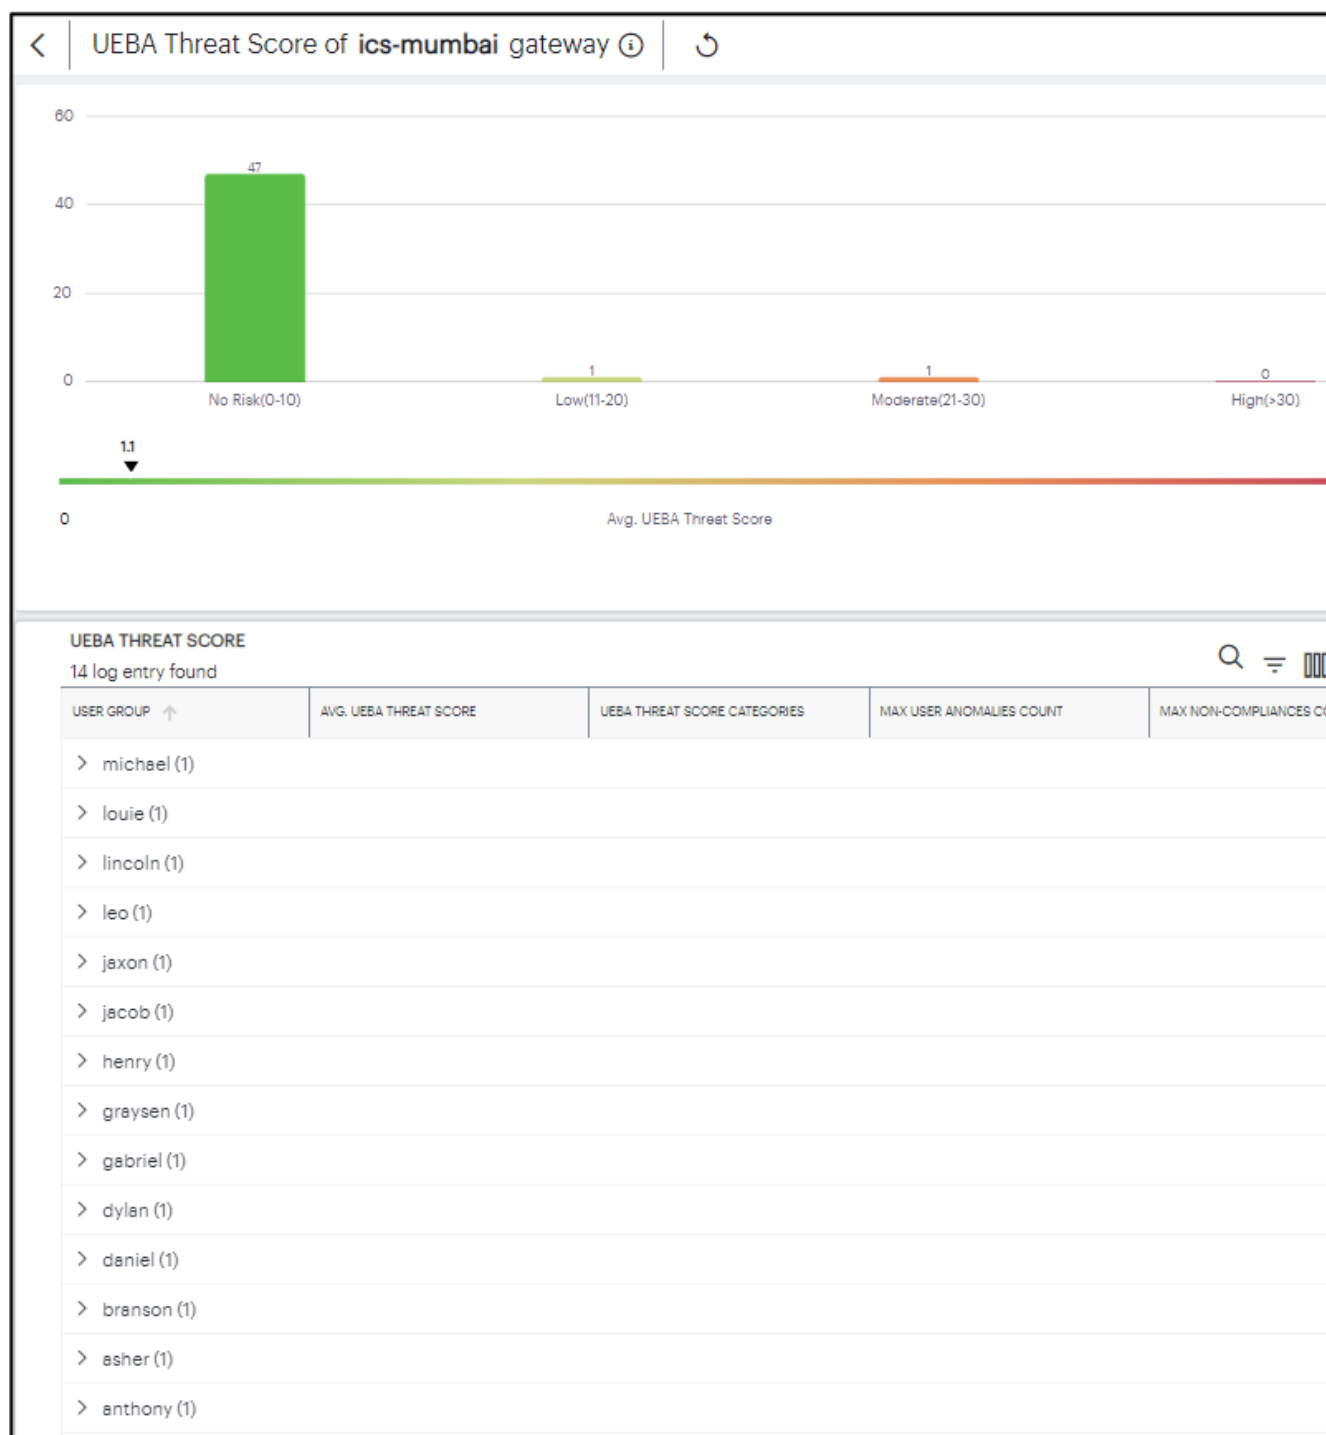

Understanding the Display

The *Users Overview* page contains the following components:

- **Filter bar**, allowing the selection of active or historic data, and filtering by Gateway. For details, see ["Using the Filter Bar" on page 56](#).
- **Summary ribbon**, showing metrics for user activity. For more details, see ["Viewing the Users Summary Ribbon" on page 87](#).
- **User Top Stats, Top 10 Users By UEBA Threat, UEBA Threat Types**, showing graphs and metrics for UEBA Threat scores across your user groups. For more details, see ["Viewing a Summary of UEBA Threat Scores for your Users" on page 88](#)
- **User Session Trends**, showing a timeline chart of user sessions. For more details, see ["Viewing the Users Session Trend" on page 89](#)
- **Activity charts**, showing charts for *Adaptive authentication*, *Top user count*, *Top auth failures*, and *Session types*.

Each chart on this page includes a **View All** link. This link provides access to a detail view showing logs for the corresponding chart. For example:

Each detail view shows logs for the corresponding chart or category. For each column, click the *arrow* icon adjacent to the column name to sort in ascending or descending order. Use your pointer to scroll the log messages pane to view more details in the columns to the right.

Where a log message is too long for the display, hover your pointer over the message to view a tooltip containing the full text. Furthermore, to view a single log entry in a dedicated panel, click the log message text to activate the info-panel view.

Viewing the Users Summary Ribbon

The Summary ribbon at the top of the *Users Overview* page shows activity totals for the selected time filter:

The ribbon indicates the totals accrued for each category during the displayed time period, as indicated adjacent to the category name. Hover your pointer over the category elements to show a descriptive tooltip.

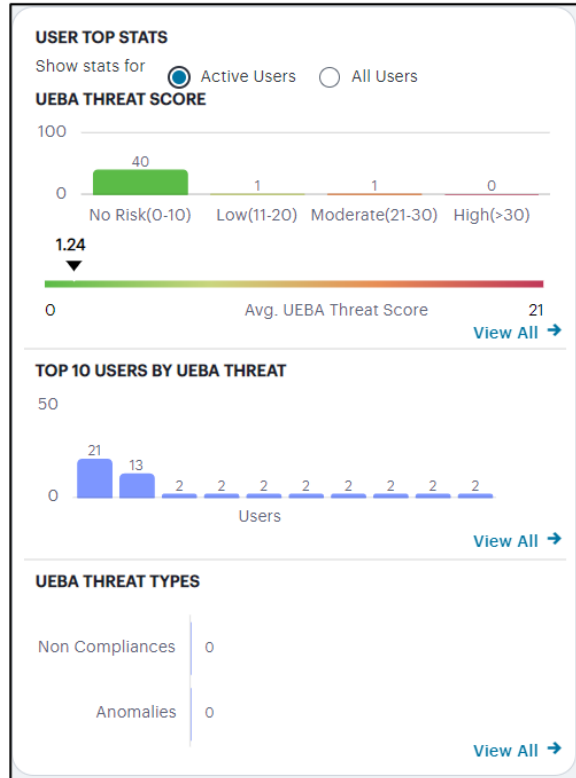

- **Active Gateways:** The total number of active Ivanti Connect Secure Gateways.
- **Active Users:** The number of active users during the selected time period.
- **Active Devices:** The number of active devices.
- **Active Sessions:** The number of active sessions.
- **Active Applications:** The number of in-use applications.
- **Non-Compliances:** The number of non-compliant sessions (full/partial non-compliant) across all gateways in the last 24 hours.
- **Auth failures:** The number of authentication failures in the last 24 hours.
- **Active Anomalies:** The number of anomalies detected by Ivanti Connect Secure in the last 30 days.

By default, the data presented in the ribbon corresponds to the current day, since midnight GMT. The number of hours over which the data applies is displayed in each category. To change the time period, use the filter bar (see ["Using the Filter Bar" on page 109.](#))

Viewing a Summary of UEBA Threat Scores for your Users

On the **Insights > Users** page, the *User Top Stats* panel displays information concerning UEBA threat across your user base:

The User Top Stats contains:

- **Active Users** tab to view user stats of the active users.
- **All Users** tab to view user stats that include users logged in for the last 30 days.

The panel provides:

- A breakdown of UEBA threat by user.
- The average UEBA threat score across all users.
- The top-10 users scoring highest for UEBA threat. It also shows the UEBA threat score threshold set, to terminate the user sessions with applicable rule on reaching the permissible limit.
- A break-down of UEBA threat types.
- The policies with highest non-compliance.

A user's UEBA Threat score is calculated from a combination of:

- Application access attempts originating from anomalous geographic locations.
- Non-compliant user devices that attempted to access your applications.

Each additional incident increments a user's overall UEBA Threat score.

The *No. of users* chart provides a visual indication of the number of users that fall into each of the UEBA Threat categories. These categories are shown as a range of UEBA Threat scores and number of users. The upper and lower bands for each category are shown in brackets. The categories are:

- No risk (0-10)
- Low (11-20)
- Moderate (21-30)
- High (>31)

Where a particular threat category matches no users for the selected time period, that category label is not shown.

Below this chart, Ivanti Connect Secure displays the **Average UEBA Threat Score** for all users on a scale between zero UEBA Threat and the highest UEBA Threat score measured at the end of the current time period.

The maximum value shown in the chart corresponds to the highest UEBA Threat score for all users as they stand at the end of the time period, not the highest they have been within that period.

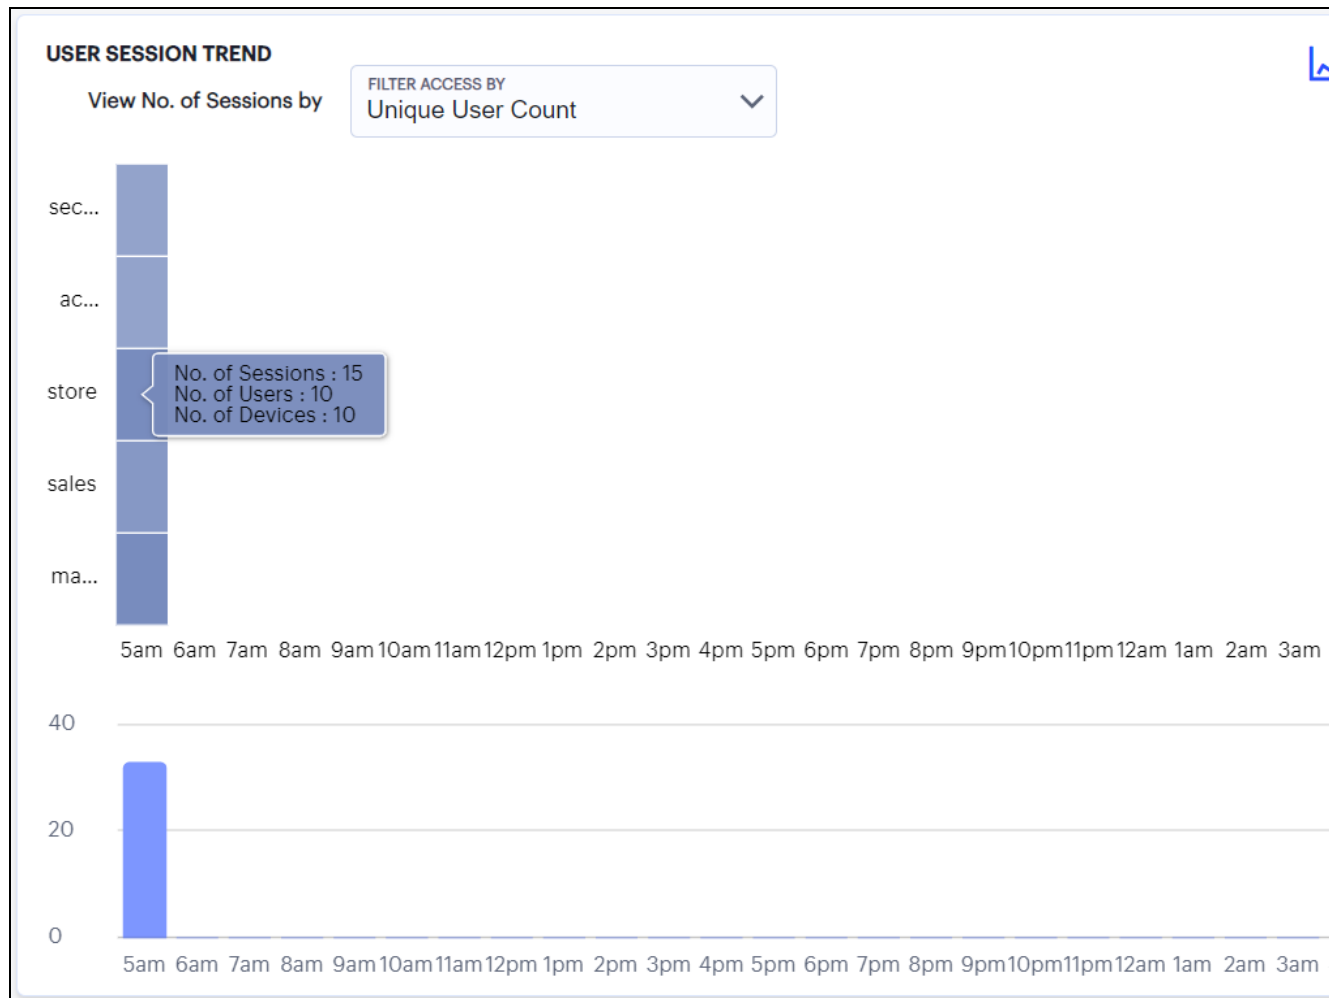

The *Top 10 Users by UEBA Threat Score* chart shows the top-10 users with the highest cumulative UEBA Threat score across the selected time period. Hover your pointer over each bar in the chart to see the name of the corresponding user.

The *UEBA Threat Type* chart provides a breakdown of all geolocation anomalies and non-compliances that occurred during the selected time period.

The *Top Policies with Non-compliances* chart shows the device policies that recorded the highest number of non-compliances for the active users. Hover your pointer over each bar in the chart to see the name of the corresponding policy.

Viewing the Users Session Trend

Ivanti Connect Secure uses this section to show user sessions trends that occurred during the period:

You can choose to display this information through bar charts (as shown), or in a Sankey chart. Use the toggle icon at the top-right to select the required view:

To expand the current view, click the Full Screen icon:

In bar chart view, the bar chart shows one of following data types, selected using the drop-down control:

- Unique User Count
- Unique Session Count

- Unique Device Count

In the Sankey chart view, Ivanti Connect Secure provides an alternate visualization of user sessions, showing directed flow between related objects.

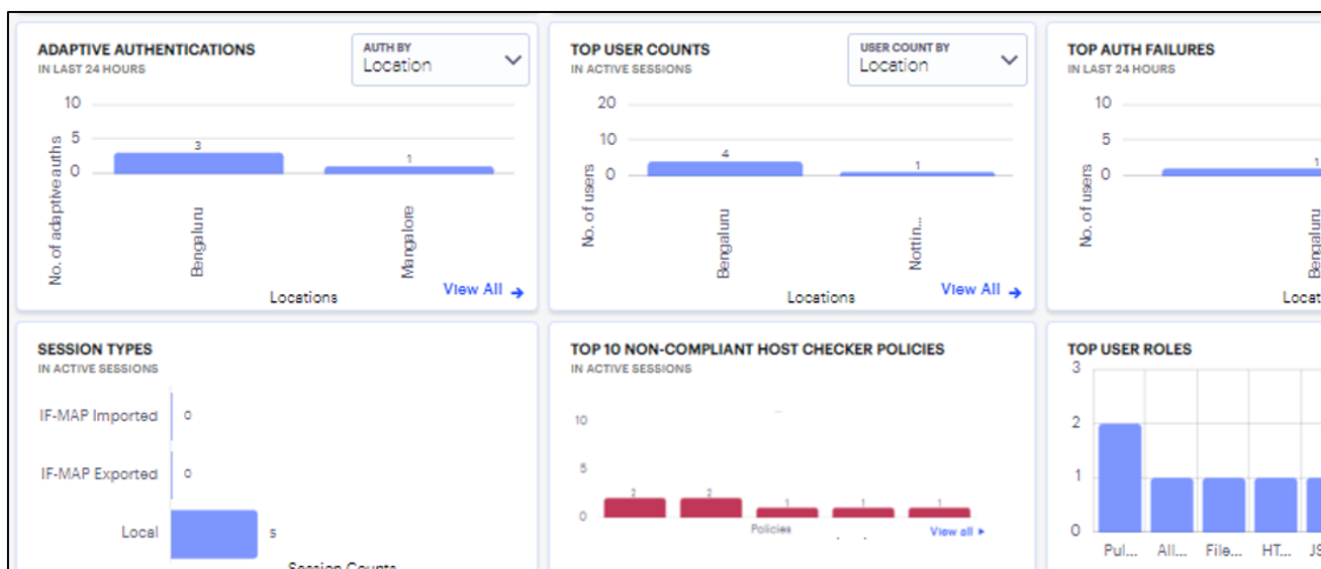

The chart maps **User Roles** > **Device Types** > **Gateways**. By hovering your pointer over a flow of interest, Ivanti Connect Secure displays a tooltip confirming the scale of the activity between the two objects connected by the flow.

To focus the display on a specific flow, or to identify related objects that interact with this flow, click the chart at a point of interest. Ivanti Connect Secure provides highlighting to all flows that pass through the point selected.

Viewing the Users Activity Charts

Ivanti Connect Secure provides charts to represent user activity:

- **Adaptive Authentications:** a chart of adaptive authentication in the last 24 hours based on Location, Realm, or Reason.
- **Top User Counts:** a chart showing users that accrued the highest number of successful accesses based on Location, Auth Server, Gateway, Device Type or Session.
- **Top Auth Failures:** a chart of authentication failures observed based on the Location, Auth Server, or Gateway.
- **Session Types:** a chart showing number of Imported IF-MAP sessions, Exported IF-MAP sessions and Local sessions.
- **Top 10 Non-Compliant Host Checker Policies:** a chart showing the top 10 host checker policies that recorded the highest number of non-compliances.
- **Top User Roles:** a chart showing the totals for the number of user roles such as marketing, sales, account, security, store. Total number of users in report for user sessions group by user roles is increased to 40,000 from 22.8R1.2 release.

Click the **View All** link that provides access to a detailed view showing logs for the corresponding chart.

In the detailed log page:

- Double-click on any log to view additional details of that log in the Info Panel to the right.
- Use the Group by option and select the field type to view the table information in groups. Then click > to view the logs in that group.

- Use the Advanced Filter icon to view logs based on the pre-defined filter, operator and value. To learn more, see ["Filtering the Logs" on page 123](#).
- To move a column, click the header of the column and drag it to a desired new position.

Reviewing Application Usage

Applications are defined primarily by the URI you use to access them, and can be fully *defined* (for example, a complete URI denoting a specific application at a location).

Ivanti Connect Secure provides views for your application usage metrics for all defined applications in your Ivanti Connect Secure deployment..

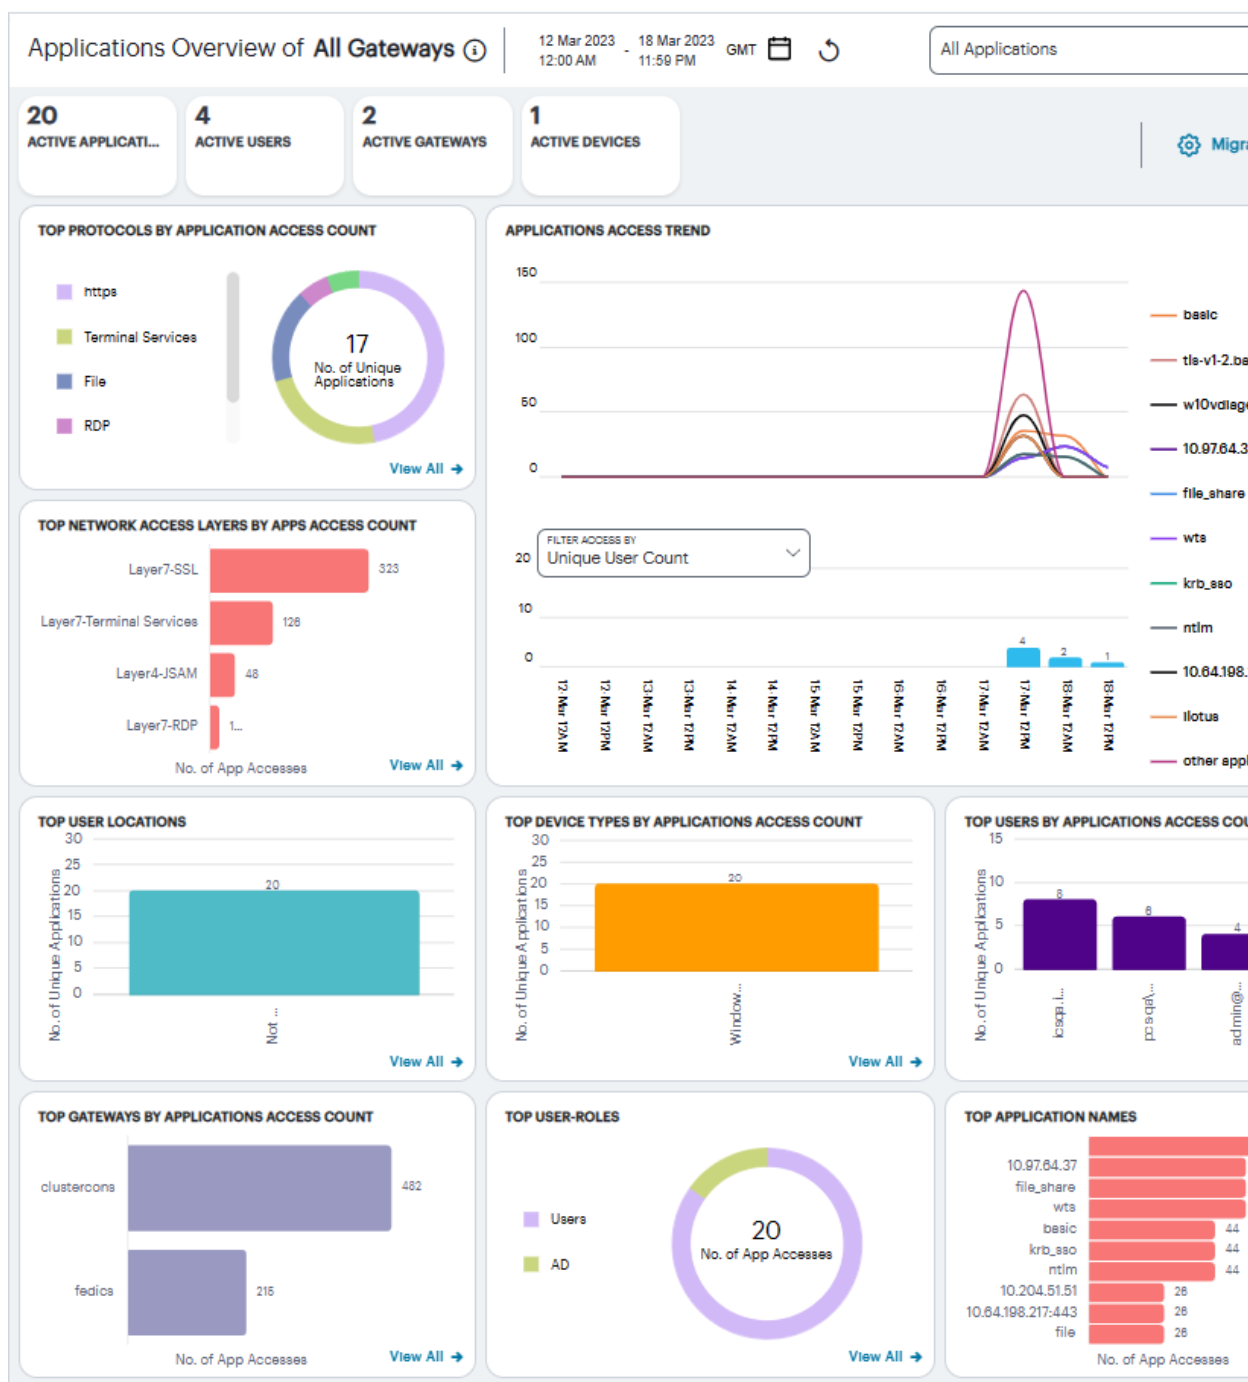

To view application usage:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).

The *My Home* page appears.

- From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Applications**.

The *Applications Overview* page appears, showing the selected metrics.

Understanding the Display

The Applications page contains the following components:

- **Filter bar**, allowing the selection of active or historic data, and filtering by Gateway. For details, see ["Using the Applications Filter Bar" below](#).
- **Summary ribbon**, showing details of the selected gateway. For more details, see ["Using the Applications Summary Ribbon" on the next page](#)
- **Top Protocols by Application Access Count**, showing number of top protocols that attracted the greatest number of application accesses. For more details, see ["Viewing Top Protocols by Application Access" on the next page](#).
- **Applications Access Trend**, showing applications accesses trends that occurred over a period. For more details, see ["Viewing Applications Access Trend" on page 97](#).
- **Activity charts**, showing application access details of *Top Network Access Layers*, *Top User Locations*, *Top Device Types*, *Top Users*, *Top Gateways*, *Top User Roles*, and *Top Application Names*. For more details, see ["Viewing the Activity Charts" on page 100](#)

Each chart on this page includes a **View All** link. This link provides access to a detail view showing logs for the corresponding chart. For example:

Using the Applications Filter Bar

Ivanti Connect Secure uses the top part of the display on all **Insights** data analysis pages to show the current page title, the default time period, and options to:

- Manually refresh the data
- Select the date and time period for which data is displayed.
- Set a filter for a specific Ivanti Connect Secure Gateway
- Select Layer 3 and Layer 7 Applications

L3 user sessions support viewing both IPv4 and IPv6 applications.

By default, analytics data on this page and others is shown for the last hour or current day. To manually refresh the data, click the circular arrow:

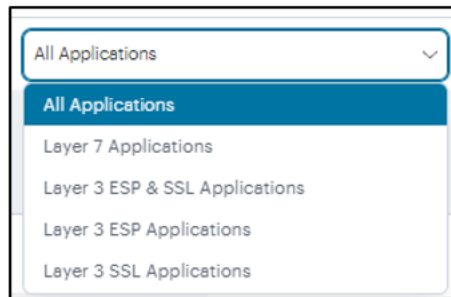

Ivanti Connect Secure provides the ability to show focused metrics for a specific Ivanti Connect Secure Gateway. To select a specific gateway, use the filter icon:

In the Filter panel, from the drop-down list select the required gateway and click **Apply**.

To clear the selection, click **Clear All**.

Ivanti Connect Secure provides the ability to show focused metrics for Layer 3 and Layer 7 applications. By default, data on this page shows for **All Applications**. Select the required application access from the list to view the corresponding charts and trends in the Applications page. Within Layer 3 Applications, you can choose ESP or SSL applications.

Using the Applications Summary Ribbon

The Summary ribbon provides the following metrics:

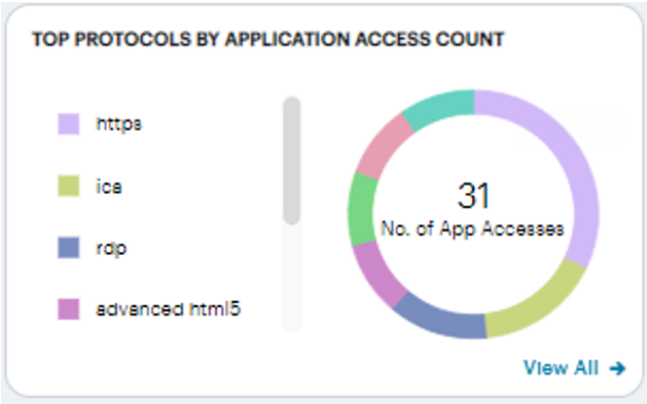

- **Active Applications:** The total number of active applications defined on the Ivanti Connect Secure.
- **Active Users:** The number of active users.
- **Active Gateways:** The number of active Gateways.
- **Active Devices:** The number of active devices.

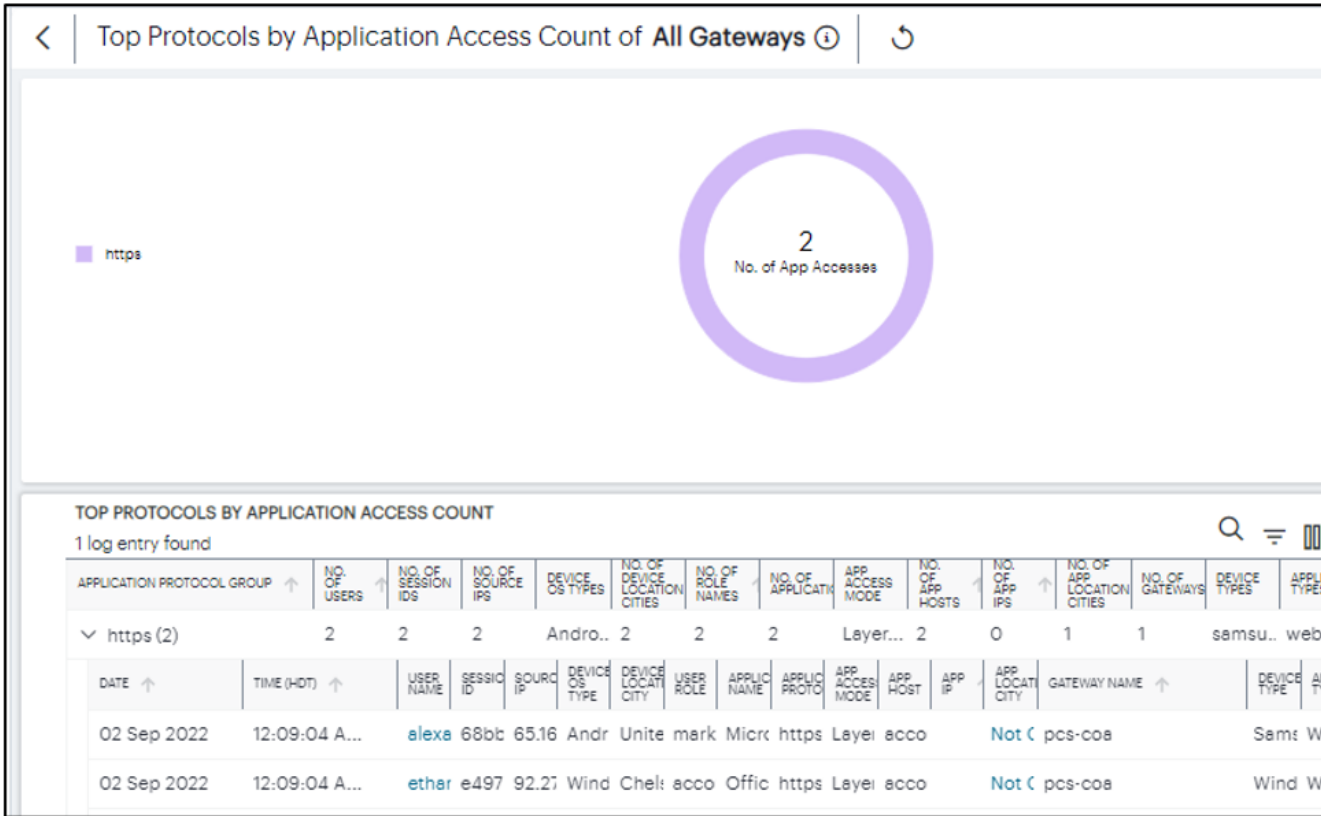

Viewing Top Protocols by Application Access

The **Top Protocols by Application Access Count** radar chart shows the top protocols that attracted the greatest number of application accesses during the period (for example, Web, RDP, SSH or Bookmark).

Hover your pointer over each bar to display a tooltip of the protocol type and number of accesses recorded.

To view a detailed list of events that contributed to the totals, click **View all**.

Viewing Applications Access Trend

The **Applications Access Trend** panel shows application access trends that occurred during the period. Choose to display this information through line and bar charts, or in a Sankey chart.

Use the toggle icon at the top-right to select the required view. Also at the top-right, use the full-screen icon to toggle the current view between normal and full screen.

- In line/bar chart view:

The display is split into two charts:

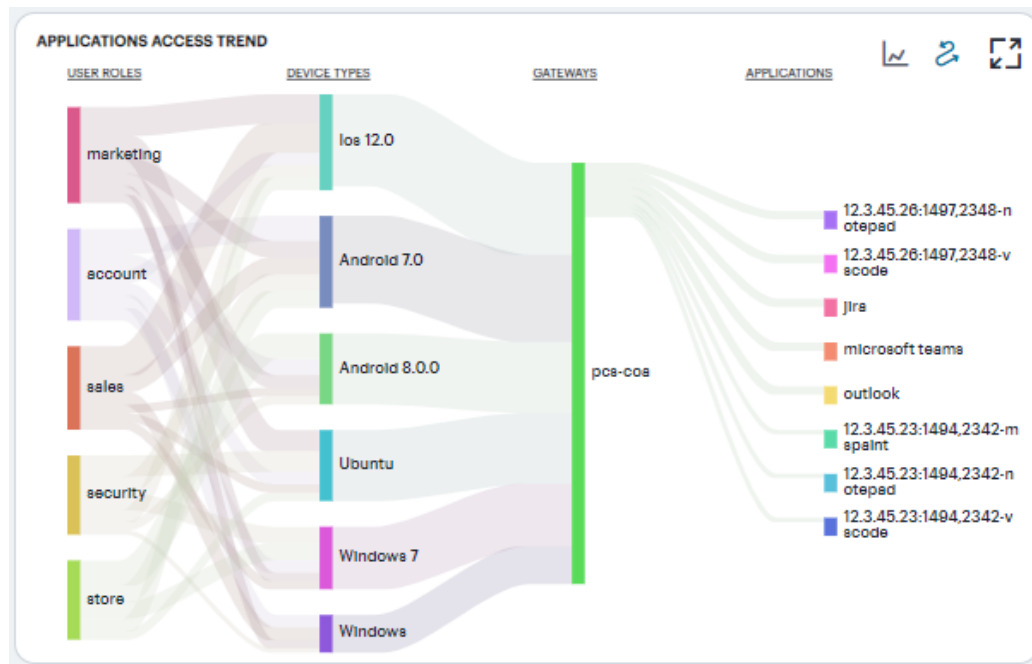

- A line chart showing the number of accesses for the top-10 applications during each hourly period of the day
- A bar chart showing one of four data types, selected using the **Filter Access By** drop-down control:
 - **Unique User Count:** Shows a count of unique user activity identified during each hourly period.
 - **Unique Device Type Count:** Shows a count of unique device types identified during each hourly period.
 - **Unique Location Count:** Shows a count of activity from unique user locations identified during each hourly period.
 - **Unique User Group Count:** Shows a count of activity from unique user groups identified during each hourly period.

In this chart, you can:

- Hover your pointer over each hourly interval to view a tooltip showing the corresponding data totals.
- Click and drag a select box across a shorter time period to zoom in on a narrower time window. To return to the full 24 hour period, click the *zoom out* icon.
- Click the corresponding line in the graph to view only the data for that specific user group.

Using the Sankey Chart View

The Sankey chart provides an alternate visualization of application access activity, showing directed flow between related objects. The width of each stream in the flow is proportional to the utilization of the object the flow passes through, allowing an administrator to view significant usage and relationships across your user groups and application infrastructure.

Hover your pointer over a flow of interest to display a tooltip confirming the scale of the activity between the two objects connected by the flow.

To focus the display on a specific flow, or to identify related objects that interact with this flow, click the chart at a point of interest. Ivanti Connect Secure provides highlighting to all flows that pass through the point selected.

Viewing the Activity Charts

The **Activity Charts** on this page represent top application access totals in the following categories:

- **Top Network Access Layers by Apps Access Count:** a bar chart showing the count of Layer 3 and Layer 7 applications accesses.
- **Top User Locations:** a bar chart showing the count of application accesses made from various user locations.
- **Top Device Types by Applications Access Count:** a bar chart showing a count of number of applications accesses made from various devices.
- **Top Users by Applications Access Count:** a bar chart showing a count of number of applications accesses made by the users.

- **Top Gateways by Applications Access Count:** a bar chart showing a count of number of applications accesses made from Gateways.
- **Top User Roles:** a bar chart showing the count of application accesses made by various user roles (example: Marketing, Sales, Accounts, Security).
- **Top Application Names:** a bar chart showing the count of application accesses made to various applications (example: Microsoft Teams, Outlook).

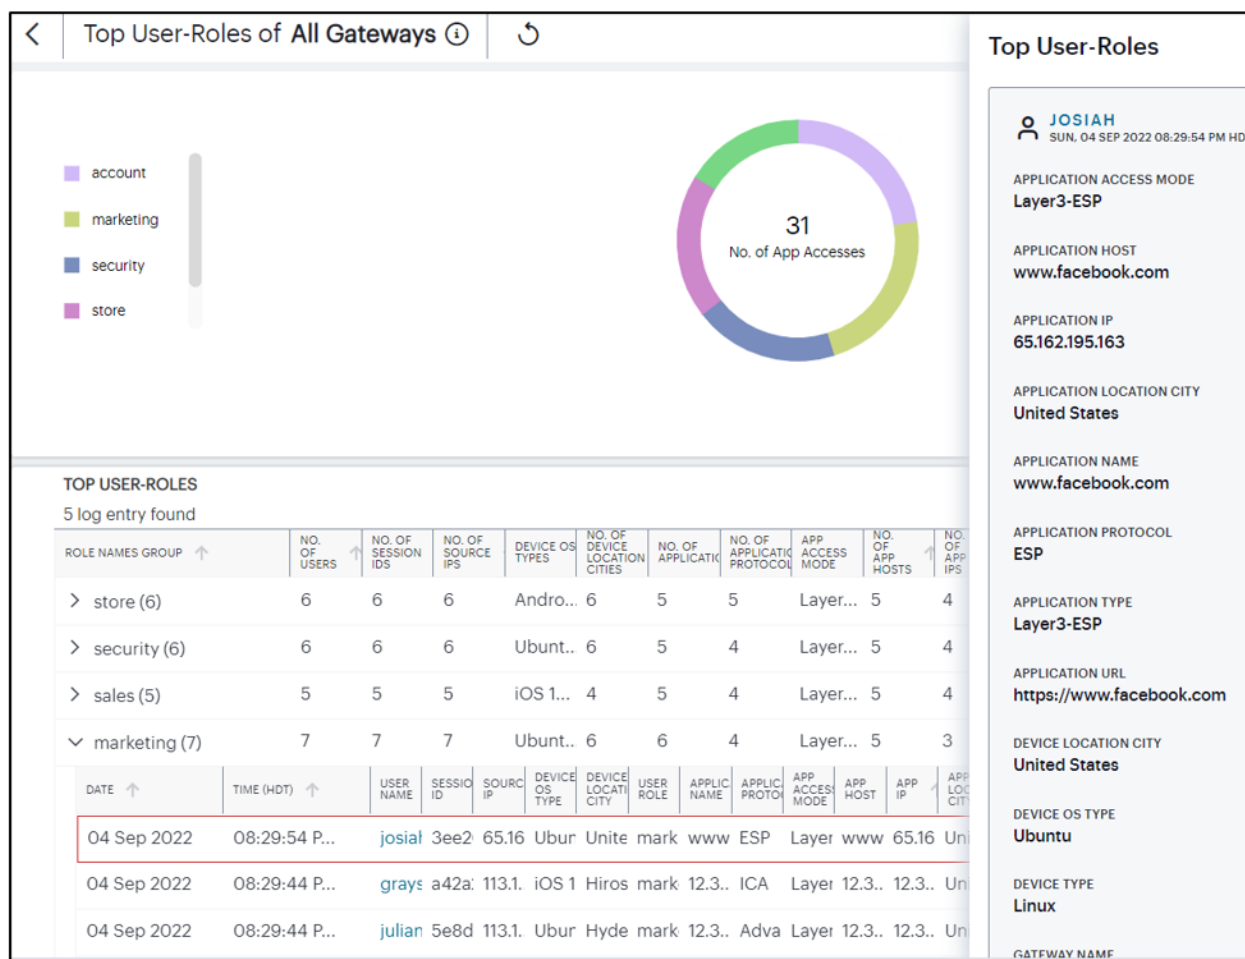

Hover your pointer over a particular element to view a tooltip showing the label and total.

Use the Filter to view active access count by Gateway, Device Type, User Name, User Role, or User Location City.

Click the **View All** link that provides access to a detailed view showing logs for the corresponding chart.

In the detailed log page:

- Double-click on any log to view additional details of that log in the Info Panel to the right.

- Double-click on any log to view additional details of that log in the Info Panel to the right.
- Use the Group by option and select the field type to view the table information in groups. Then click > to view the logs in that group.

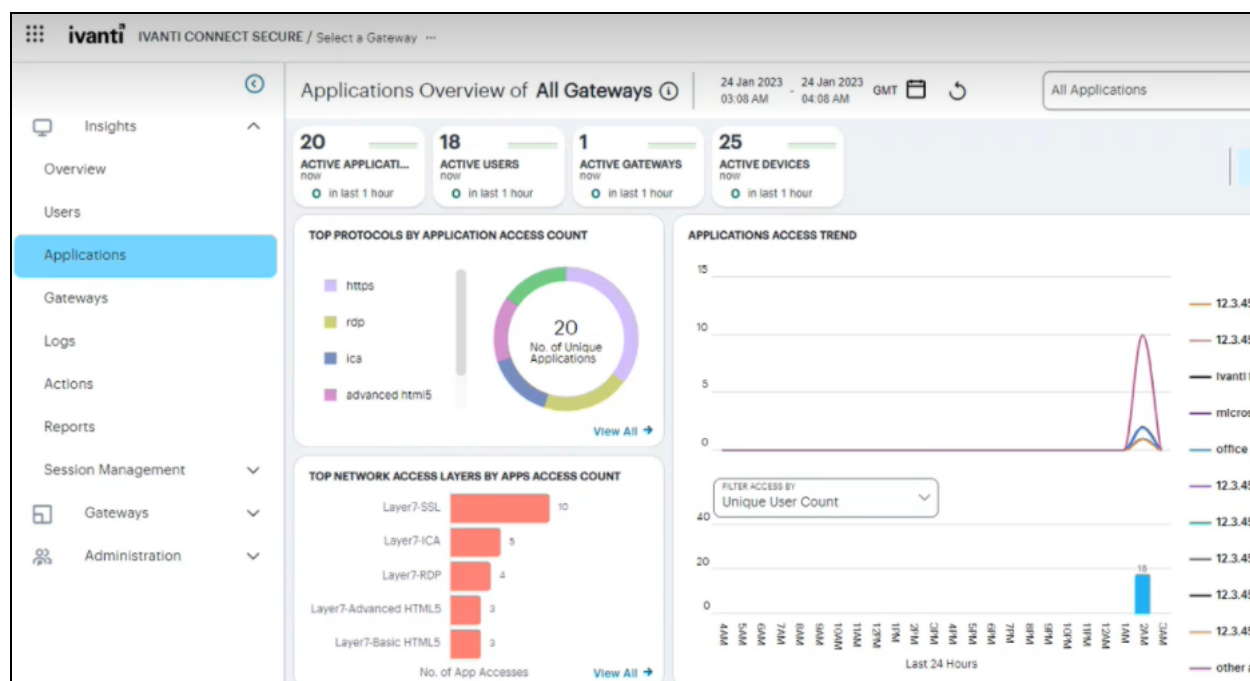

- Use the Advanced Filter icon to view logs based on the pre-defined filter, operator and value. To learn more, see ["Filtering the Logs" on page 123](#).
- To move a column, click the header of the column and drag it to a desired new position.

Configuring nZTA Policy to an ICS Application

Administrators can now configure ICS application with nZTA Secure Access Policy from the nSA-ICS Applications page. This feature requires nZTA license. The Secure Access Policy defines how end users can connect to nSA to access applications.

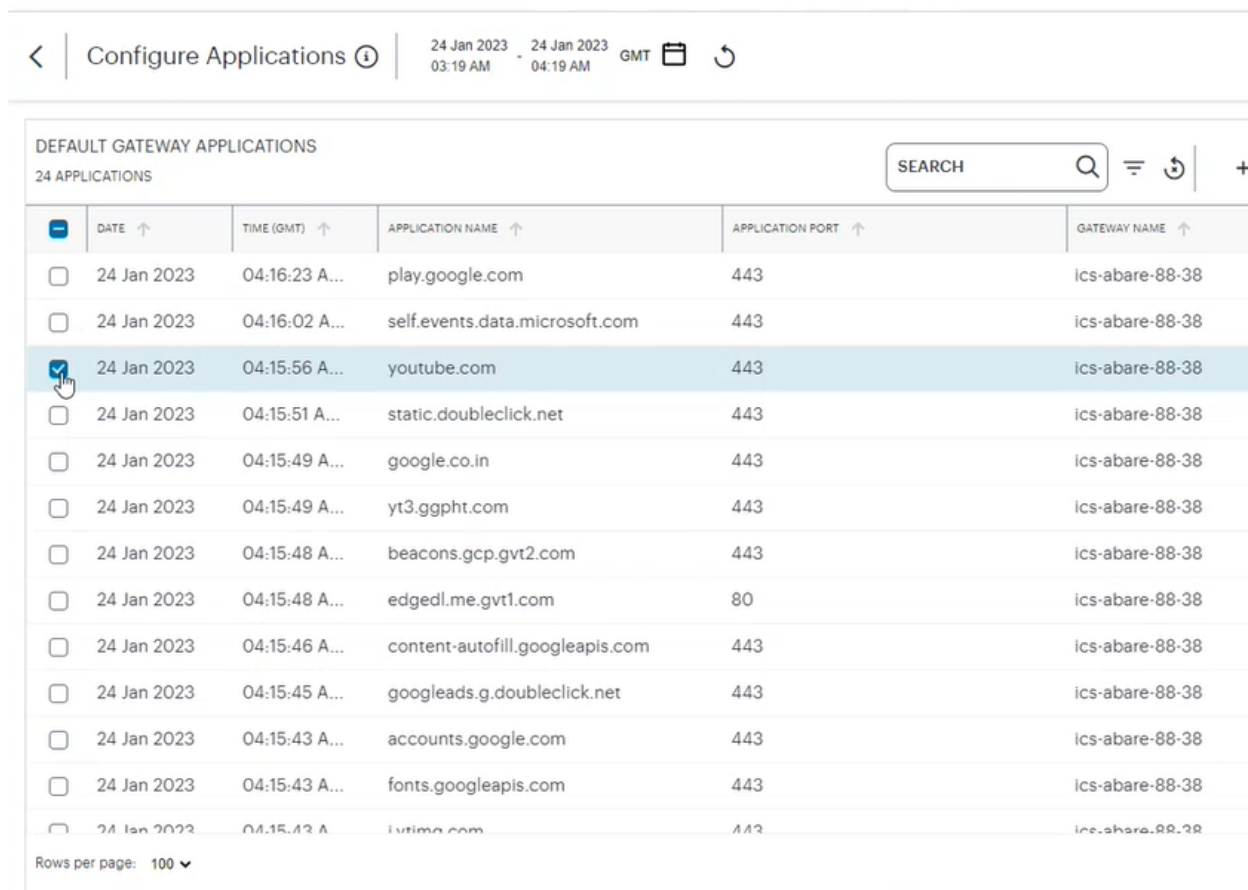

A Configure button is provided in the ICS Applications page to configure nZTA Secure Access Policy to an ICS application.

To configure nZTA policy to the ICS application:

1. In the ICS applications page, click **Configure**.

The *Configure Applications* page is displayed showing a list of accessed applications behind the ICS gateway.

	DATE ↑	TIME (GMT) ↑	APPLICATION NAME ↑	APPLICATION PORT ↑	GATEWAY NAME ↑

☐ Create bookmark for application ☐ Enable Application Discovery

☐ Add to Application Group

Save Application

4. Click **Save Application** and then click **Next**.
5. Define Device Policy, User Group and Gateway/Gateway Group/Gateway Selector. For details, see the section [Creating a Secure Access Policy](#).

Reviewing Individual User Activity

This page shows activity relating to a specific user in your Ivanti Connect Secure deployment.

To access the User Overview page:

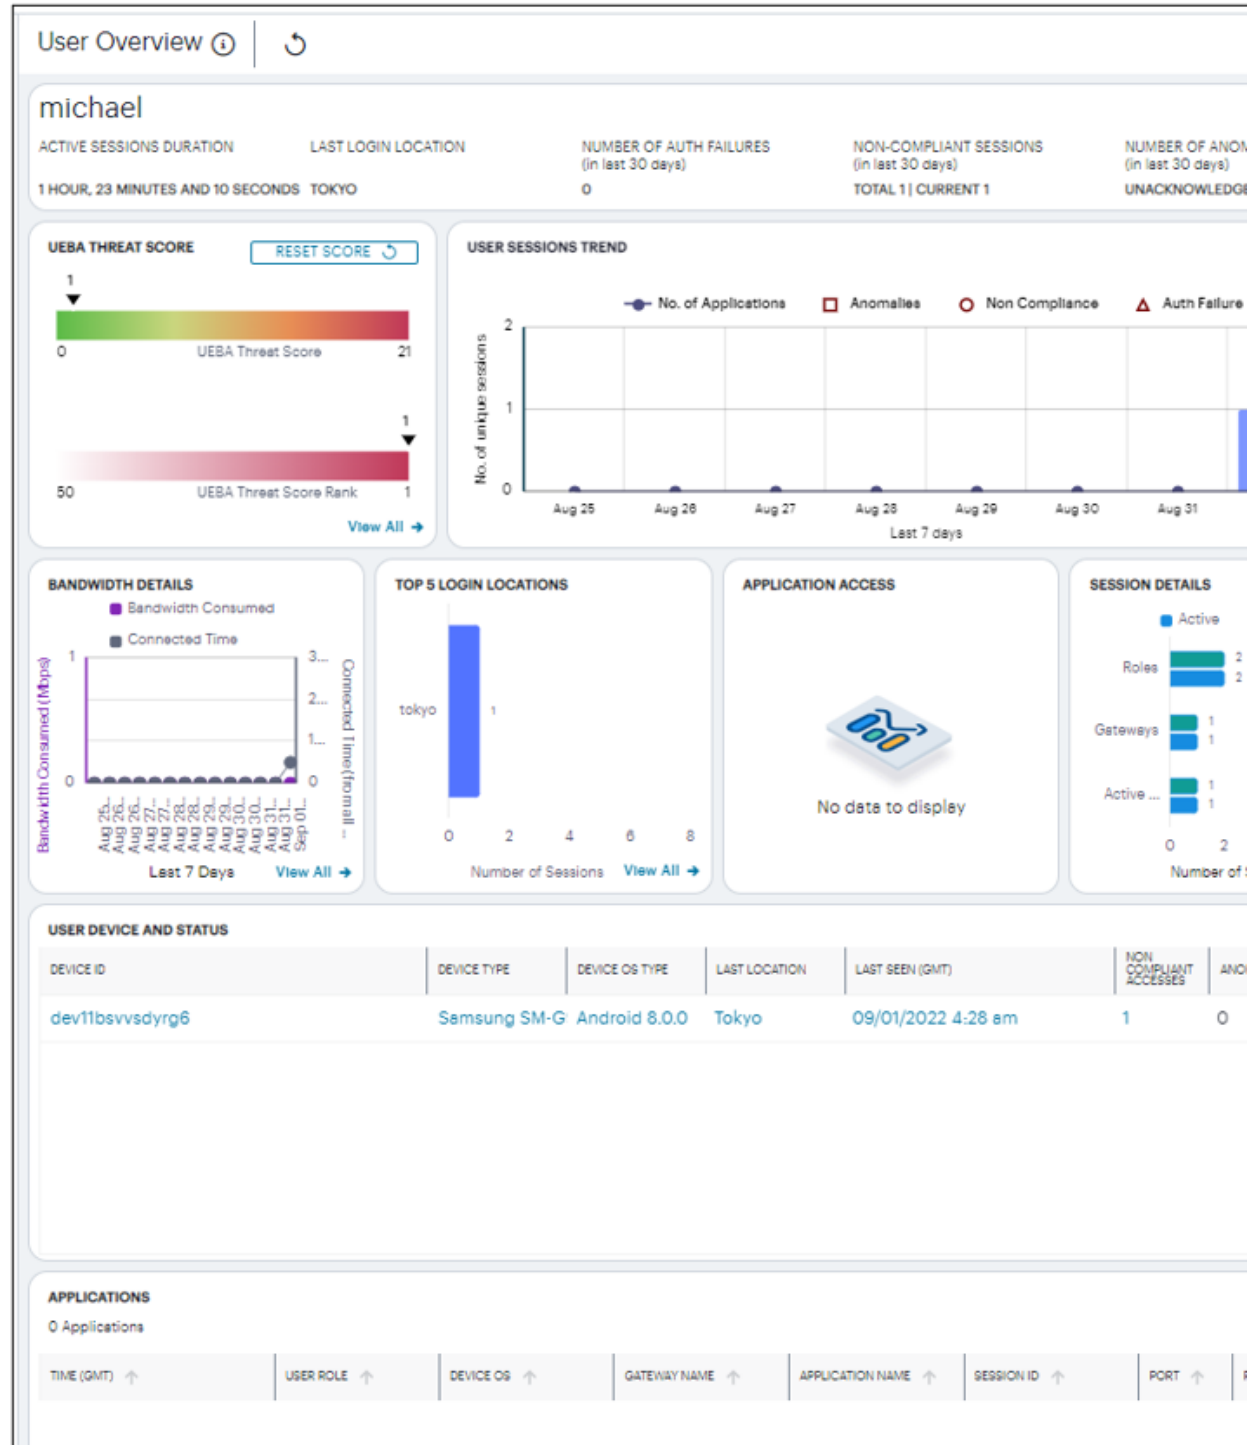

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select **Ivanti Connect Secure** from the Gateway Switcher. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24.

The *My Home* page appears by default.

2. Launch the User Overview page by doing one of the following:

- In the **Search** field on Filter bar, type the username for which you want to see the activities.
- In the Summary ribbon, click **Active Users**. In the Active Users panel displayed, click the username link for which you want to see the activities.
- Click the **View All** link in any of the charts. In the logs table displayed, click the username link for which you want to see the activities.

The User Overview page is displayed.

The page has the following areas:

- The Filter bar
- The Summary ribbon

- UEBA Threat Score and UEBA Threat Score Rank
- User Sessions trend
- Activity charts, showing charts for Bandwidth details, Last 5 Login Locations, Application Access and Session Details
- Table showing User Device and Status

Each chart on this page includes a View All link. This link provides access to a detail view showing logs for the corresponding chart.

Using the Filter Bar

The top part of the page has the option to manually refresh the data.

Viewing the User Summary Ribbon

The Summary ribbon provides the following metrics:

- **Active Sessions Duration** – All active sessions duration combined of the user, displayed in hours, minutes, and seconds.
- **Last Login Location** – The location from where the user has last logged in.
- **Number of Auth Failures** – The number of authentication failures for this user in the last 30 days.
- **Number of Non-Compliant Sessions** – The number of Non-compliant sessions (full/partial non-compliant) for this user across all gateways in the last 30 days.
- **Number of Anomalies** – The number of anomalies (acknowledged and unacknowledged) detected by Ivanti Connect Secure in the last 30 days.

ACTIVE SESSIONS DURATION	LAST LOGIN LOCATION	NUMBER OF AUTH FAILURES (in last 30 days)
22 MINUTES AND 49 SECONDS	UNITED STATES	0

Viewing the UEBA Threat Score

The UEBA Threat Score panel contains:

- **UEBA Threat Score** – It is the cumulative value of number of anomalies and number of non-compliant sessions of this user. Click the **View All** link to see the log details in a table.
- **UEBA Threat Score Rank** – It is the UEBA Threat score position of this user based on the UEBA Threat scores of all the users in the tenant.
- **Reset Score** – As an administrator, you can reset the UEBA Threat score of this user.

A user's UEBA Threat score is calculated from a combination of geographic anomalies, non-compliance with device policies, and activity deviations.

Viewing the User Session Trend

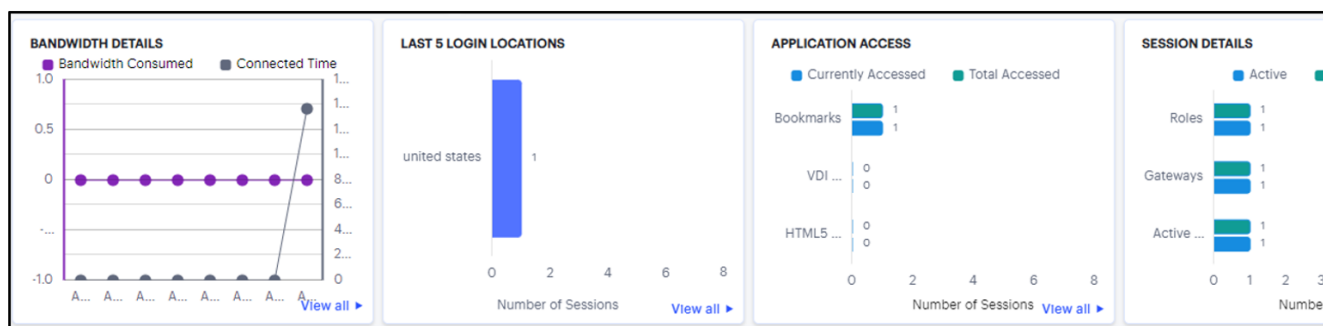

This section shows the following user activities per day that occurred during the last seven days. You can hover over the trend to view details.

- Number of unique Active Sessions
- Number of Applications accessed
- Number of Anomalies
- Number of Non-Compliance sessions
- Number of Auth Failures

Viewing the User Activity Charts

This Ivanti Connect Secure provides charts to represent user activity:

- **Bandwidth Details** – shows the Bandwidth Consumed per day and Total Time connected per day by the user for the last seven days.
- **Last 5 Login Locations** – shows the last top five Login Locations accessed by the user in the last 30 days.
- **Application Access** – shows the number of Applications accessed by the user in the active sessions and in the last 30 days based on Bookmark, VDI and HTML5 access.
- **Session Details** – shows the number of Active Sessions and Total number of sessions in the last 30 days based on Role, Gateways and Active sessions

Click the **View All** link that provides access to a detailed view showing logs for the corresponding chart.

Viewing the User Device and Status

This table provides the status of the devices used by the user for connecting to VPN in the last 30 days. Each row in the table includes Device ID and Device Type of a device among other user session details.

Click the link in each column to drill-down for additional details.

USER DEVICE AND STATUS					
DEVICE ID	DEVICE TYPE	LAST LOCATION	LAST SEEN	COMPLIANT ACCESSSES	ANOMALIES
dev10vs4P6oBSlh	Windows 7	Hyderabad	August 25, 2021 7:05 PM	0	2
dev9QxuDmgStf8	Ubuntu	Fleet	August 25, 2021 7:05 PM	0	0

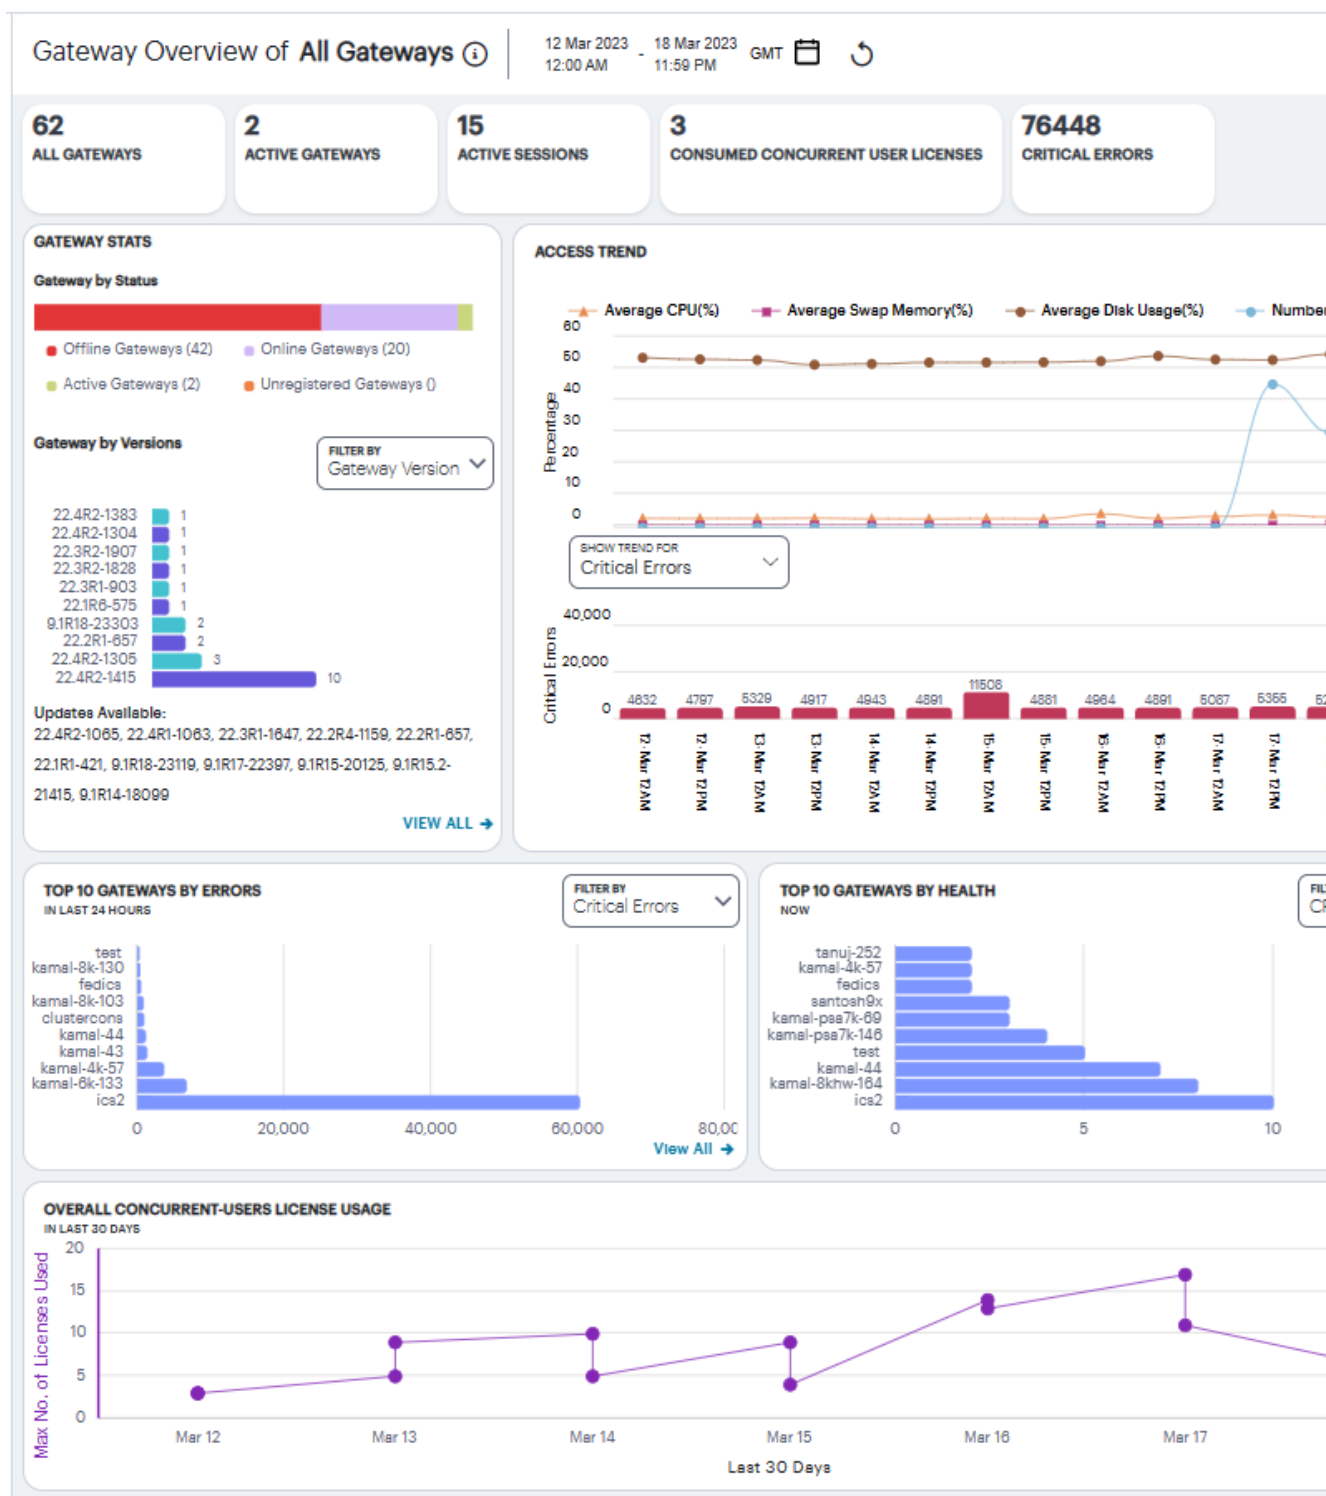

Reviewing Gateways Status and Versions

The Gateway Overview page gives an overall detail of all the gateways that are registered in the tenant.

To access the Gateway Overview page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Gateways**.

The *Gateway Overview* page appears.

Understanding the Display

The Gateway Overview page contains the following components:

- Summary ribbon
- Gateway Status and Versions
- Access Trend View
- Top 10 Gateways by Errors
- Top 10 Gateways by Health
- Overall Concurrent Users License Usage

Use the Filter bar, located on the top-right-corner of the page, that allows the selection of active or historic data, and filter by Gateway. For details, see ["Using the Filter Bar" on page 56](#).

Each chart on this page includes a **View All** link. This link provides access to a detail view showing logs for the corresponding chart.

Viewing the Gateways Summary Ribbon

The Gateway Overview Summary panel gives the following details:

- **All Gateways:** Shows the total number of Ivanti Connect Secure Gateways that are registered with the tenant.
- **Active Gateways:** The total number of active gateways within the tenant.
- **Active Sessions:** The total number of active sessions across all the connected gateways within the tenant.
- **Consumed Concurrent User Licenses:** The total number of concurrent user licenses consumed across all the gateways.
- **Critical Errors:** The total number of critical errors in the last 24 hours across all the gateways. The trend shows the critical error occurrence in the last 24 hours. It also shows the number of errors increased or decreased in the last 24 hours.

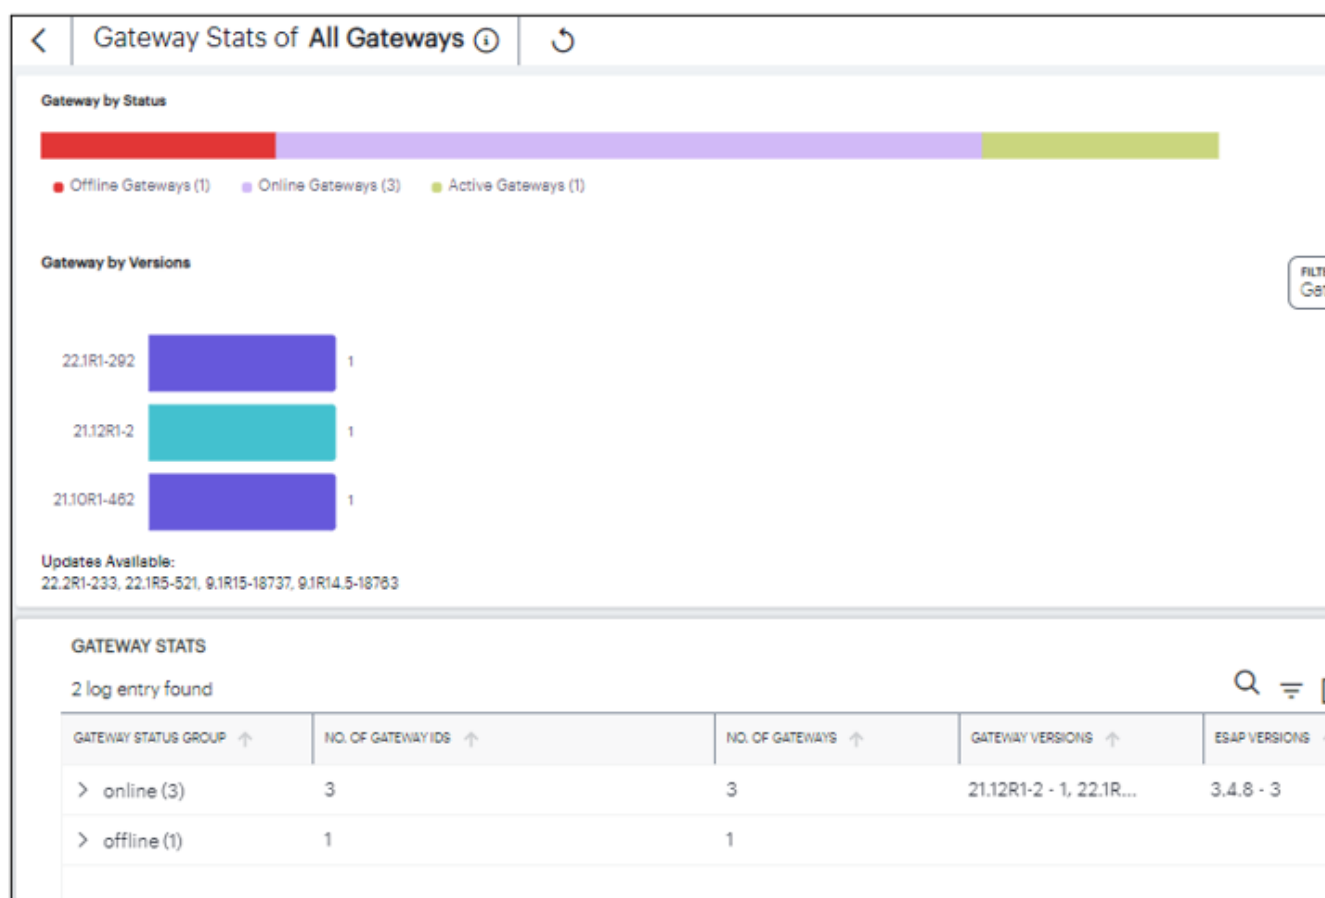

Viewing the Gateways Status and Versions

The Gateways by status chart shows the distribution of gateways by their status:

- **Offline Gateways:** All gateways that are registered with the tenant, but not connected.
- **Online Gateways:** All gateways that are registered with the tenant and connected but are not running any sessions.
- **Active Gateways:** All gateways that have at least one active session.

The Gateway by versions chart shows the distribution of latest 10 gateway versions across all the gateways within the tenant. The Gateways by ESAP version chart shows the distribution of latest 10 ESAP versions across all the gateways within the tenant.

To view a detailed list of events that contributed to the totals, click **View All**.

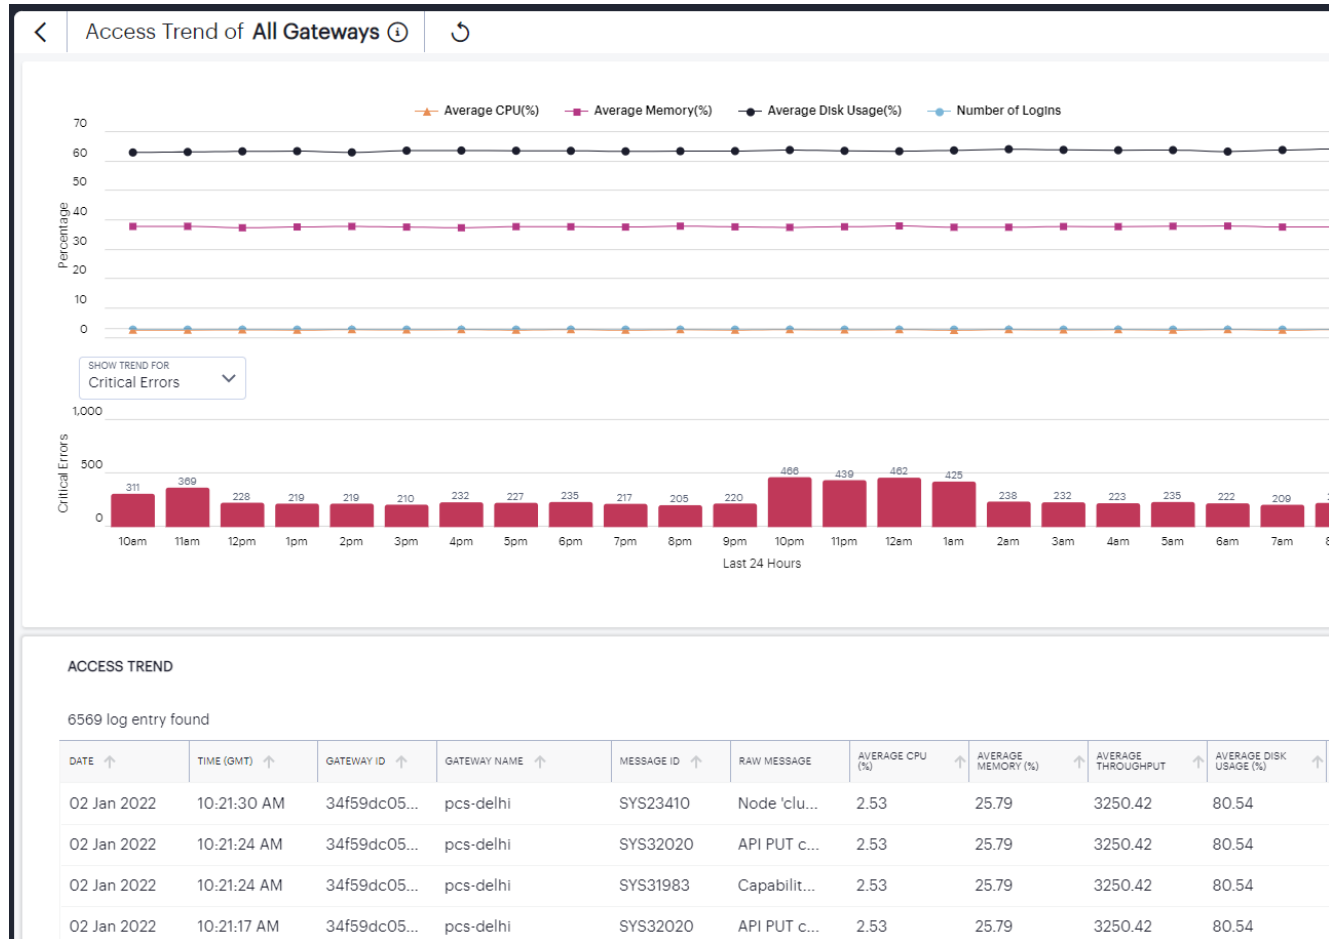

Viewing the Gateways Access Trend

Ivanti Connect Secure uses the Gateways Access Trend section to show:

- the hourly distribution of the number of logins, average CPU usage, average memory usage, average disk usage, average network throughput across all the gateways during the last 24 hours.
- the hourly distribution of critical errors across all the gateways during the last 24 hours.

You can check the trend for **Critical Errors** and **Throughput (MB)**.

To view a detailed list of events that contributed to the totals, click **View All**.

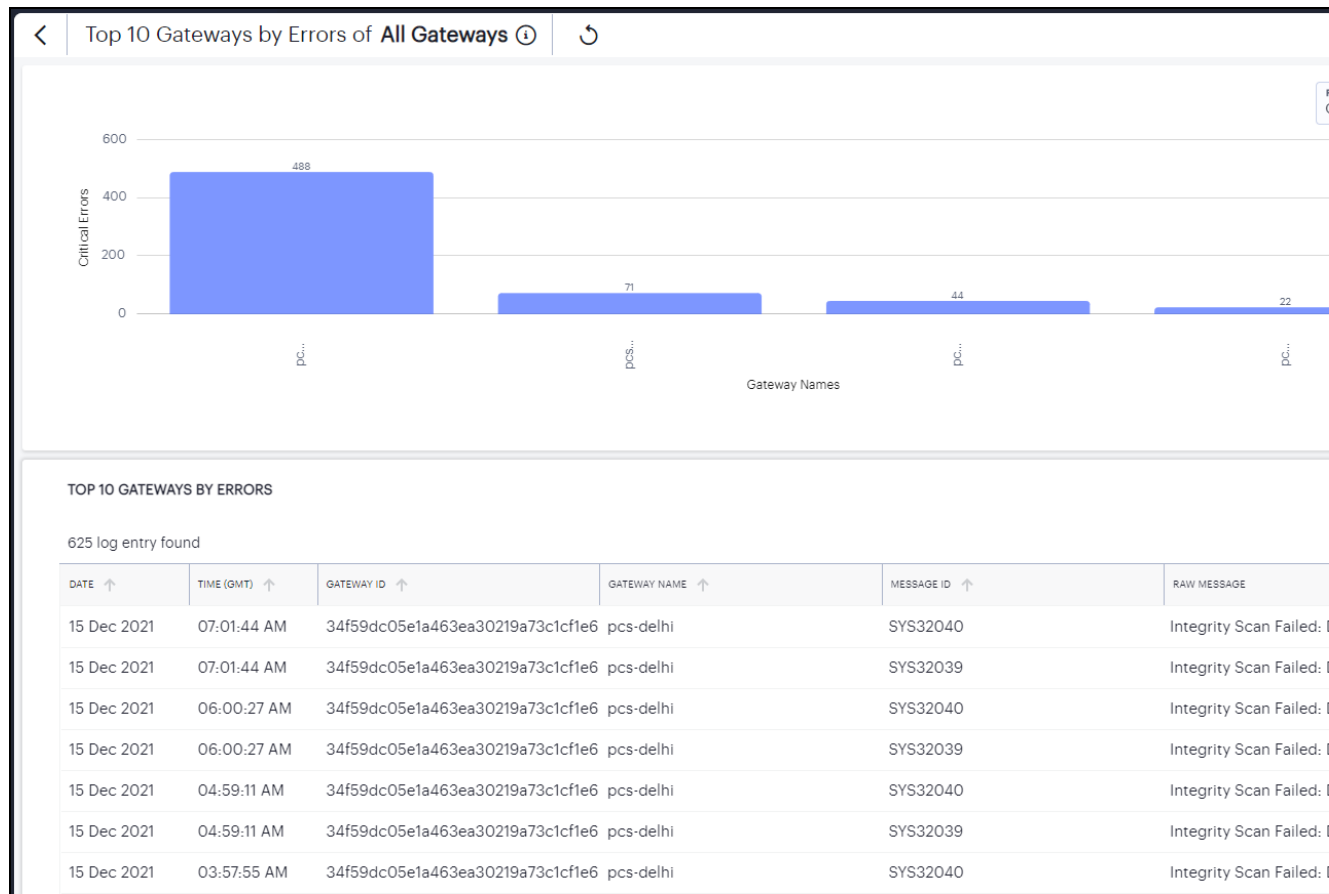

Viewing the Top Gateway Activity Charts

Ivanti Connect Secure provides charts to show breakdown of Top 10 Gateways by Errors and Top 10 Gateways by Health.

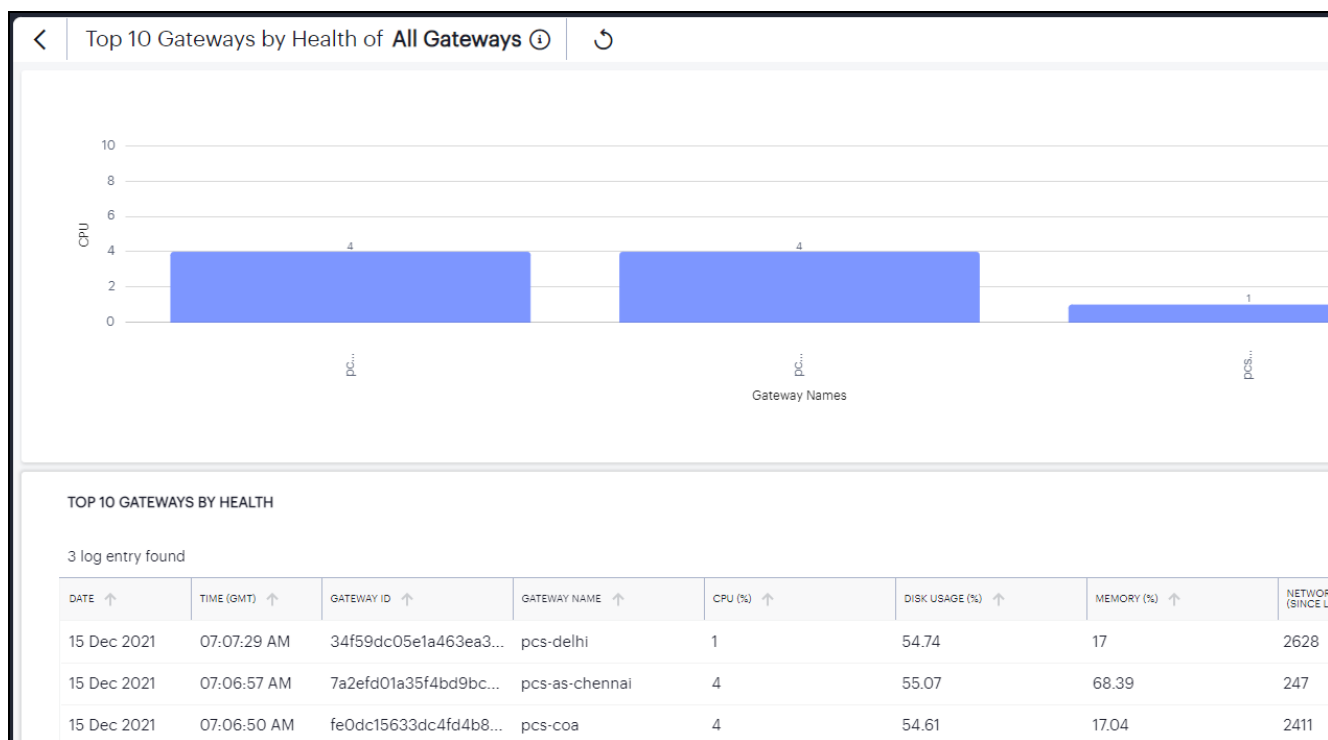

The Gateways by Errors chart provides the total number of Critical Errors or Integrity Check Violations across top 10 gateways over the last 24 hours. Use the Filter drop-down to select the option from the list.

To view a detailed list of events that contributed to the totals, click **View All**.

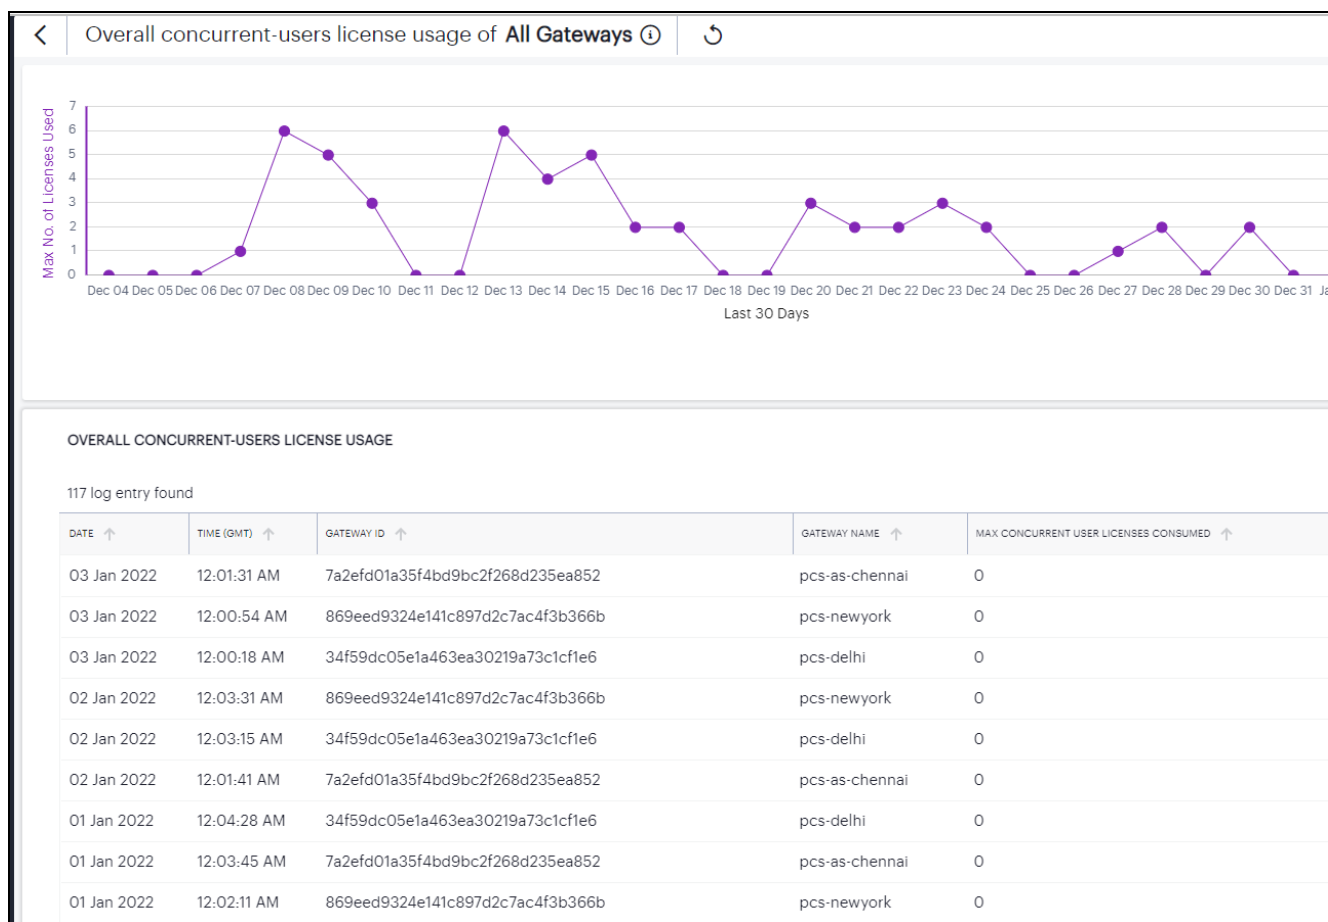

The Gateways by Health chart shows the top 10 gateways that have high CPU usage, Memory usage, Disk usage, or Network throughput. Use the Filter drop-down to select the option from the list.

To view a detailed list of events that contributed to the totals, click **View All**.

The Overall Concurrent Users License Usage chart provides the maximum licenses used on a daily basis across all the gateways over the last 30 days.

To view a detailed list of events that contributed to the totals, click **View All**.

- Use the Advanced Filter icon to view logs based on the pre-defined filter, operator and value. To learn more, see ["Filtering the Logs" on page 123](#).
- To move a column, click the header of the column and drag it to a desired new position.

Checking the Logs

The Ivanti Connect Secure Logs page displays audit and activity events observed by your Ivanti Connect Secure access infrastructure. These events are reported to the Ivanti Neurons for Secure Access by your Gateways and Authentication, Authorization and Accounting (AAA) service.

To view the Logs page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).

The adjacent time selection boxes update according to your choice. For **Time Period**, set the time period you want to view. Choose from:

- Last 60 minutes
- Last 24 hours (default)
- Last 7 days
- Last 1 month

For **Time Range**, set a specific *Date* and *Time* for both the start and end of your time range.

Setting Log Criteria and Filtering the Output

To set the criteria you want to use for viewing log data, use the controls above the main log display. This section also contains functions to highlight search terms, apply filters, and schedule log export jobs.

Select the primary log type you want to display by using the **Log Type** drop-down list:

Choose from:

- Access Logs
- Admin Logs
- Event Logs

Then, use the icons adjacent to the log selector to further control your log selection. Choose from the following:

- Logs are refreshed automatically by changing the criteria. To manually refresh the log display, click the following icon:

- To change the fields displayed for each log line, click the following icon:

In the field selector, click a field name to toggle between show or hide. A *tick* icon indicates a displayed field. After you are finished, click the context menu icon to close the selector. See ["Viewing Log Records"](#) below.

- To trigger the advanced filter selection, use the following icon:

To learn more, see ["Filtering the Logs"](#) on page 123.

- To group the logs based on the fields, use the **Group by** button and select the field type to view the table information in groups.
- To export the displayed log as a CSV or JSON text file, or to set up a new scheduled log export job, click the **Export Logs** button:

To learn more about log export jobs, see ["Exporting Logs"](#) on page 125.

- To view the status of currently-scheduled log export jobs, click the **Scheduled Jobs** tab.

To learn more about log export jobs, see ["Exporting Logs"](#) on page 125.

- To change the view density, click the following icon:

Viewing Log Records

The main part of the page shows the log records that match your selected criteria. The number of matching log records is displayed at the top-left.

Each log line includes the following fields:

- A status indicator showing the level of severity associated with each log event. Use the following table for a guide to the meaning of each indicator color:

Severity Status Color

INFO	Green
MINOR	Amber
MAJOR	Amber
CRITICAL	Red

- The date and time of the event.
- The message ID that identifies this type of event.
- The severity of the event in words.
- The session ID that was the source of the event, where applicable.
- The ID of the Ivanti Connect Secure Gateway that reported the event, where applicable.
- The name of the Ivanti Connect Secure Gateway that reported the event, where applicable.
- The IP address identified as the source of the event.
- The user name associated with the event, where applicable.
- The ID of the device associated with the event, where applicable.
- The message (description) of the event.

Use the page controls at the bottom to select the number of log records/rows per page:

Choose from:

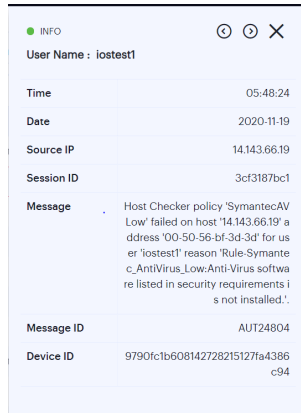

- 50
- 100 (default)

- 200

To cycle through the log pages, use the page controls at the bottom-right.

Where a single log message is too long for the display, use your pointing device to scroll the optional fields display to the left or right.

Furthermore, to view a single log entry in a dedicated panel, click the log message text to activate the info-panel view:

● INFO		⏮ ⏪ ⏩ ⏭
User Name : iostest1		
Time	05:48:24	
Date	2020-11-19	
Source IP	14.143.66.19	
Session ID	3cf3187bc1	
Message	Host Checker policy 'SymantecAV Low' failed on host '14.143.66.19' address '00:50:56-bf-3d-3d' for user 'iostest1' reason 'Rule-Symantec AntiVirus_Low: Anti-Virus software listed in security requirements is not installed.'.	
Message ID	AUT24804	
Device ID	9790fc1b608142728215127fa4386c94	

In the info-panel, use the **Previous** and **Next** icons to cycle through each log entry in turn.

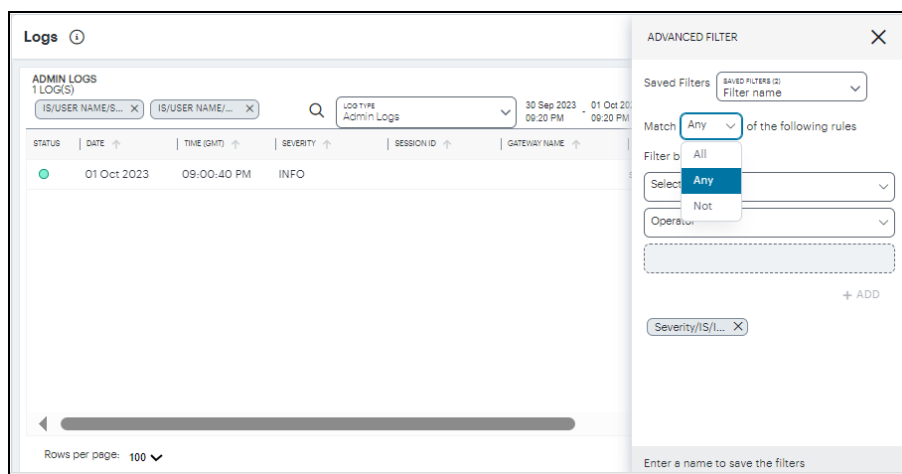

Filtering the Logs

The **Logs** page provides an advanced field filter through which you can narrow down the displayed log entries to a sub-set that matches the filters you apply.

To add a filter, click the following icon:

Next, use the pop-up dialog to add one or more new field filters.

In this dialog, select a matching criteria for the filters.

- **All:** performs AND operation on the filters
- **Any:** performs OR operation on the filters
- **Not:** Negates the list of filters

Use the **Selector** drop-down list to choose the field you want to filter on, add an **Operator** type, and then enter the **Value** you want to apply.

For the operator, choose from:

- **IS:** The selected field matches exactly the value you specify.
- **CONTAINS:** The selected field contains as a sub-string the value you specify.

Click the *plus* symbol to add your filter, then repeat the process to add any further filters you want to apply.

To apply your filters to the log data, click **APPLY**.

Your filters remain in place through data refreshes and are displayed at the bottom of the screen. To remove a filter, click the corresponding *X* icon.

In addition, Ivanti Connect Secure enables you to store advanced filters for future use. After you have applied filter criteria, enter a filter name into the box provided and click **Save**.

To load a previously-saved filter, select your filter from the **Saved Filters** drop-down list and click **Apply**.

To delete one or more previously-saved filters, select the filters from the **Saved Filters** drop-down list and click **Delete**.

Exporting Logs

Ivanti Connect Secure provides the ability to export the currently-displayed log as a Comma-Separated Value (CSV) or JavaScript Object Notation (JSON) text file. You can download the log immediately or set up a scheduled job to activate or repeat the export action at a defined time and interval of your choosing.

To access the Export Logs page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24.
2. From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Logs**.

The *Logs* page appears.

3. Select the log type you want to display in the **Log Type** drop-down list. Choose from:
 - Access Logs
 - Admin Logs
 - Event Logs

4. Click the *cloud* icon at the top of the page:

The Export Logs page appears:

Export once/event logs ⓘ

Please note: You've reached 5 out of your 5 limit for exports.

CancelExport

Use the Export Logs settings page to configure an export operation, either to execute immediately as a one-off job, or as a scheduled job.

Configure the following settings:

- Select either **CSV** or **JSON** as the output format.
- Select the frequency of the export operation. Choose from:
 - **Export one time**: Perform the log export now as a single job.
 - **Daily data export**: Create a daily export job executed once per day from the selected start date, up to and including the stop date (if defined).
 - **Weekly data export**: Create a weekly export job executed once per week on the selected start day, up to and including the stop date (if defined).
 - **Monthly data export**: Create a monthly export job executed once per month on the selected start day, up to and including the stop date (if defined).

If a stop date is specified, this is the date the schedule ceases. In the case of weekly or monthly jobs, if this date falls before the expected run date for that period, the job is terminated without running. For example, in a weekly run scheduled to execute every Thursday, if the stop date is set as a Tuesday, the final run of the job would be the previous Thursday.

A daily data export job continues to run for one extra day beyond the selected end date in order to process the logs for the final scheduled day.

For daily/weekly/monthly frequency export jobs, Ivanti Connect Secure allows for a maximum of 5 runs per scheduled export job. That is, each schedule runs a maximum of 5 times. On the sixth run, the first run is deleted (together with the log file), and so on.

- Set an export time frame. For one-time exports, choose from:
 - **Last 60 minutes**
 - **Last 24 hours**
 - **Last 7 days**
 - **Last 1 month**
 - **Set a date range (30d max)**: This option presents a configurable start and end date.

For daily, weekly, and monthly exports, this option switches to show start and end date parameters. You do not need to specify an end date; in this case, the job remains active until deleted.

- Enter a **Job name** for the export operation. Ivanti Connect Secure suggests an appropriate name; use this, or type your own.
- To execute the defined job, click **Export**.

To view all scheduled export logs jobs, and to download the log files created by each job, see ["Viewing Scheduled Log Export Jobs and Downloading Log Files" below](#)

Ivanti Connect Secure allows for a maximum of 5 defined export jobs. Each job that you add reduces the total, as displayed at the bottom of the page. This is a separate limit to the maximum number of job runs described earlier.

Viewing Scheduled Log Export Jobs and Downloading Log Files

To view the status of your current log export jobs:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Logs**.

The *Logs* page appears.

3. Click the **Scheduled Jobs** tab.

The Scheduled Jobs Status page appears:

Logs ⓘ									
<div> <div>Logs</div> <div>Scheduled Jobs</div> </div>									
<div> <div>Actions ▾</div> <div>↺</div> </div>									
<input type="checkbox"/>	JOB ↑	SCHEDULE ↑	JOB TYPE ↑	PREVIOUS RUN	CURRENT RUN ↑	RUN TIMESTAMP	EXPIRATION	CREATED	SUMMARY
<input type="checkbox"/>	> Export Once/Analyt	Onetime	Log Export		Completed	Apr 15, 2024 16:22 PM GMT		Apr 15 2024	1 0

<input type="checkbox"/>	> Export Once/Analyt	Onetime	Log Export		Completed	Apr 30, 2024 15:24 PM GMT		Apr 30 2024	1 0

Use the Job Status page to:

- View the status and progress of currently scheduled log export jobs.
- Download log files for completed job runs.

For each job on the Job Status page, you can view the configured details of the export operation along with status indicators for progress of the previous and outstanding job runs.

A job run refers to a single run of a scheduled job. For example, in a weekly data export job, a job run refers to the export operation scheduled or completed for one specific week within the start and end dates. Thus, a scheduled log export job is comprised of one or more job runs.

The **Summary** column provides totals of successful job runs, unsuccessful/failed job runs, and inactive job runs.

Click any of the fields in a single job row to display an info-panel at the side showing more details about the scheduled job:

To download the log file generated by the job run, click the *cloud* icon for a completed job run:

Completed 

To remove a scheduled log export job, or any of the completed job runs within the job, tick the checkbox adjacent to the job/job run and then click the **Actions** menu at the top of the page:

Select from the following options:

- **Delete Selected:** Remove all jobs or job runs that have been selected.
- **Pause the Job:** Instruct the outstanding job runs in the schedule to become inactive. The schedule continues chronologically, but no further log export operations are completed while in this state.
- **Resume the Job:** Resume the schedule starting at the next scheduled job run.

If you choose to delete a complete job, all job runs and log download files are removed permanently.

Configuring Actionable Insights

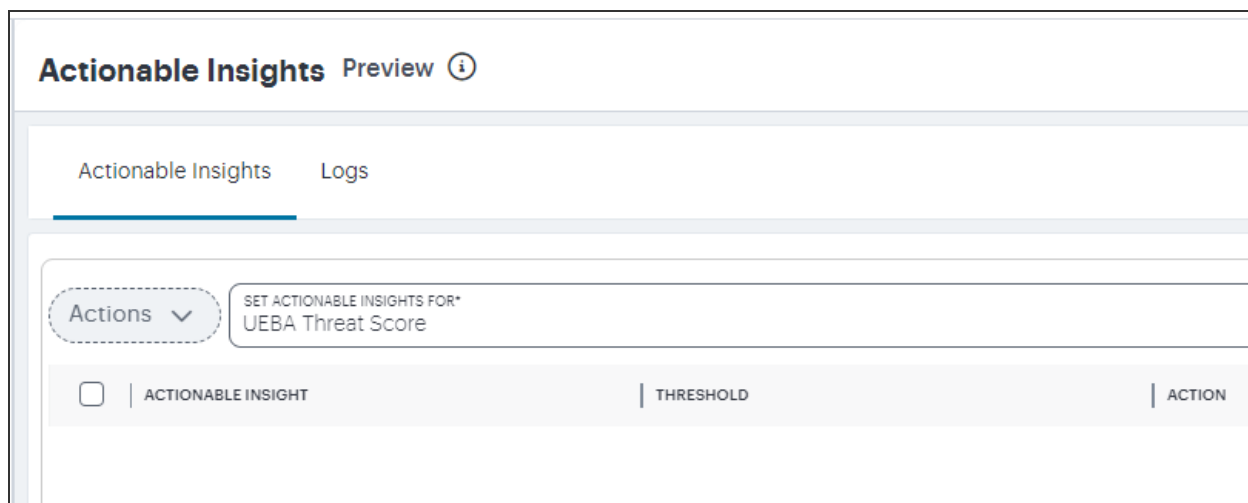

The Actionable Insights function enables the tenant admin to create a policy/action to terminate all the existing sessions, with applicable rule, of a user when the UEBA threat score goes beyond the permissible limit.

To configure actionable insights:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24.

- From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Actionable Insights**.

The Actionable Insights page is displayed.

- From the **Set Actionable Insights for** drop-down list, select **UEBA Threat Score**.

4. Click **Add Actionable Insights**.

Actionable Insights ⓘ

UEBA Threat Score

Set Threshold value \geq ⓘ

Current Session

☒ **Terminate all the existing sessions** of this user when the UEBA threat score reaches to above threshold

Subsequent Login

Trigger Action
Select action to trigger when conditions are met

☐ **Allow subsequent logins with a warning message** that UEBA threat score is beyond permissible threshold

☐ **Multi-Factor authentication**, Offer additional authentication during subsequent logins

☐ **Deny the subsequent logins with a warning message** that UEBA threat score is beyond permissible threshold

5. Enter a **Threshold Value**.
6. In the Current Session section, select the **Terminate all the existing sessions of this user when the UEBA threat score reaches the threshold value** option. This is selected by default.

7. From the Subsequent Login section, select one of the following actions to trigger when conditions are met:

The newly added trigger actions will be supported with the ISAC Client version 22.3R1.

For more details, refer KB: https://kb.pulsesecure.net/articles/Pulse_Secure_Article/KB45603.

- Allow subsequent logins with a warning message
- Offer Multi-factor Authentication during the subsequent logins
- Deny subsequent logins with a warning message

A maximum of three thresholds can be created using the subsequent login conditions.

8. Click **Create**. A table showing the metric name, threshold value that is set, and the action to trigger when the condition is met, is shown in the Actionable Insights page.

A confirmation message for the successful creation of the action is displayed. Click **Close** to close the message box.

9. To modify an action, select the check box corresponding to the action from the list, click **Actions > Edit**, make the changes and then click **Update**.
10. To change the sequence of the rule, drag up or down the rule.
11. To remove one or more actions, select the check box(es) corresponding to the action from the list, and click **Actions > Delete**. Click **Yes, Delete** to confirm.

When a user session is terminated due to reaching the threshold UEBA Threat score, the following admin log message is generated in nSA: "User <username> session <session id> has been terminated due to UEBA Threat score based Actionable Insights configuration". Select the **Logs** tab to view the list of log messages.

Generating Reports

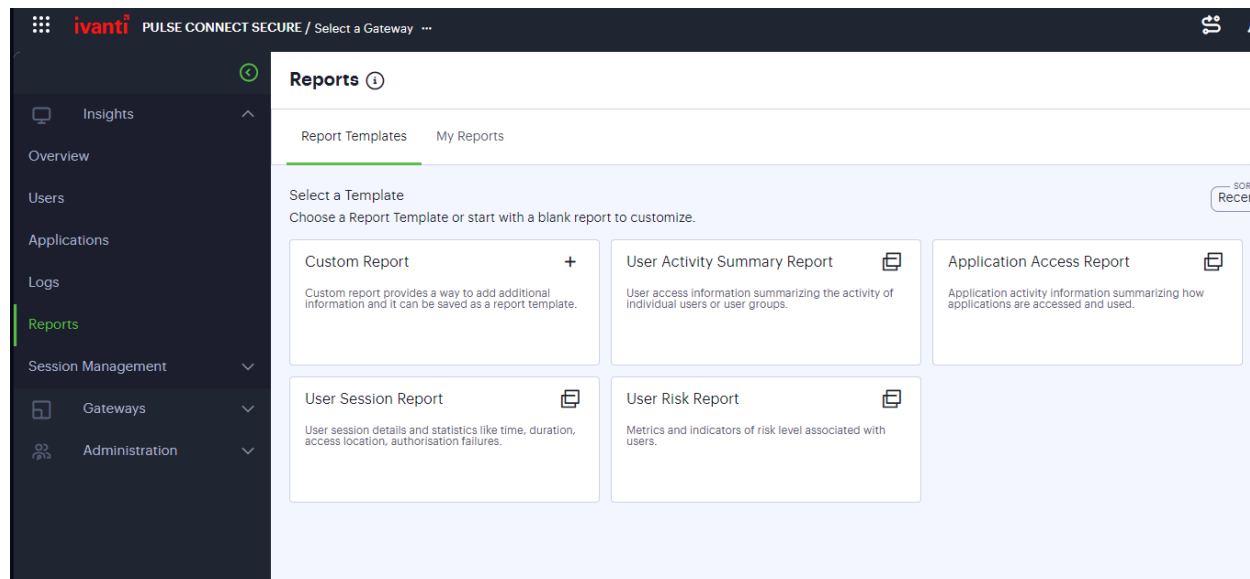

The Reports function provides the ability to generate reports from the pre-defined templates or from the custom report. You may choose any of the pre-defined templates from User Activity Summary report, Application Access report, User Risk report or User Session Report. It also provides options to generate reports in PDF, JSON or CSV formats.

Accessing the Reports Page

To access the Reports page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24.
2. From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Reports**.

The Reports page is displayed.

The Reports page provides the following tabs:

- **Report Templates** – You can use the Custom Report option or the pre-defined report templates, and go through the wizard to configure and schedule the required report.
- **My Reports** – You can view a list of generated reports for all users of this tenant.
 - Click the report name link to view the summary of the configured details.
 - Click the download icon located next to the report to view report in the specified format (PDF, JSON, or CSV)

Configuring a Report

For scheduling a report, you can select one of the pre-defined report templates if that meets your requirement. Otherwise, select the Custom Report option.

Configuring Custom Report

To configure Custom report:

1. In the Reports page, select **Report Templates > Custom Report**.
2. In the Clone page, enter unique name for the report and click **Next**.
3. In the Format page:
 1. Select the required charts from User, Device and Application sections.
 2. Select the report format (PDF, JSON, or CSV).
 3. Select the check box if you want to save the report as a template.

The screenshot shows the 'Custom Report' configuration page. At the top, there's a navigation bar with a back arrow and the title 'Reports'. Below this, a 'Custom Report' section contains tabs for 'Clone' (active), 'Format', 'Filter', 'Frequency', and 'Share'. The 'Customize and format' section prompts the user to 'Select chart to include in the report'. It features three categories: 'Application' with six chart options (Accesses Per Application, Accesses Per Application Type, Application Busy Hours, Accesses per gateway, Accesses per user location, and Accesses per user group/role), 'Device' with one option (Device Session), and a 'Select a Report Format' dropdown menu currently set to 'PDF'. A checkbox labeled 'Save this report as a template' is present, with a note stating 'The template will save the report Format not the Filter, Schedule and Recipients information'. A 'Back' button is located at the bottom right. A help tooltip on the right side reads: 'Choose a chart to include in the report. To know the chart hover over the chart, to select click on'.

4. Click **Next**.

5. In the Filter page, select the data filter from User, Device, Gateway and Application attributes. Then click **Next**.

< **Reports** ⓘ

Custom Report

✓ Clone ✓ Format Filter ⓘ Frequency ⓘ Share

Filter data

Users	Device	Gateway	Application
USER ROLES Sales	DEVICE TYPE Type (6)	GATEWAY NAME Gateway Name (1)	APPLICATION TYPE Web-Bookmark
USER NAME Carter		GATEWAY LOCATION Coa	APPLICATION GROUP Application Group (0)
USER LOCATION United States			APPLICATION NAME Motivosity

Back

6. In the Frequency page:

- **Set recurring date range** - Click the calendar icon, specify the start date and the end date, and then click **Apply**.
- **Frequency** - Select one of the options:
 - **On Demand**: Click the calendar icon, select the start date and the end date of the report, and then click **Apply**.

Frequency

On-Demand	Report range
	27 Jun 2021 02:38 PM - 27 Jul 2021 02:38 PM 

- **Daily**: Click the time icon and select the start time. Then select the time zone from the drop-down list.

On-Demand	Preferred start time
	15:02  TIME ZONE (GMT) Local Time 
Daily	Exact start time will depend on job queue activity

- **Weekly**: Select the days of the week. Click the time icon and select the start time. Then select the time zone from the drop-down list.

On-Demand	On day/s
	Mon Tue Wed Thu Fri Sat Sun
Daily	Preferred start time
	15:02  TIME ZONE (GMT) Local Time 
Weekly	Exact start time will depend on job queue activity

7. Click **Next**.

8. In the Share page, select the admin users from the list to whom the notifications need to be sent, and click **Confirm and Schedule**.

The screenshot shows the 'Reports' page with a 'Share' button. Below the 'Share' button, there is a section for 'Add recipients' with a dropdown menu showing 'admindb, tapank'. Below this, there is a table of 'Selected recipients' with columns for 'Recipient Name', 'Email ID', and 'Action'.

Recipient Name	Email ID	Action
admindb	yogesh.kumardewangan@ivanti.com	⊗
tapank	tapan.khimani@ivanti.com	⊗

At the bottom right, there are two buttons: 'Back' and 'Confirm and Schedule'.

9. In the Confirm Submission page, verify the details and then click **Schedule Report**.

The screenshot shows the 'Confirm submission' page with the following details:

Report Information

Report Template	Report Clone Name	Author
Custom Report	customrep	You

Filter

Users	Device	Gateway	Application
USER ROLES Marketing, Sales	DEVICE TYPE Iphone 12 0, Windows 7	GATEWAY NAME Pcs-Coa	APPLICATION TYPE Ica, Rdp
USER NAME Asher, Carter		GATEWAY LOCATION Gateway Location (0)	APPLICATION GROUP Application Group (0)
USER LOCATION Bengaluru, United States			APPLICATION NAME Application Name (0)

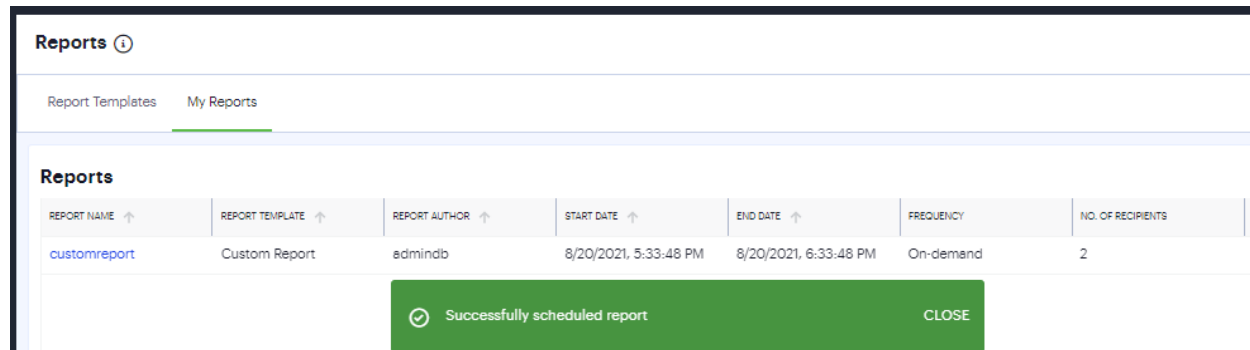

Scheduled Frequency

Start Date	End Date	Frequency
8/23/2021, 8:22:42 PM	9/23/2021, 8:22:42 PM	Weekly 5 times

Format

At the bottom right, there are two buttons: 'CANCEL' and 'Schedule Report'.

10. The report will be generated per schedule and listed in the My Reports page.
 - Click the report name link to view the summary of the configured details.
 - Click the download icon located next to the report to view report in the specified format (PDF, JSON, or CSV)

Configuring Pre-defined Report

To configure pre-defined report:

1. In the Reports page, select **Report Templates > <pre-defined report>**.
2. In the Clone page, enter unique name for the report and click **Next**.
3. In the Format page:
 1. Select the required charts from User, Device and Application sections, as applicable. By default, all the pre-defined template charts are selected.
 2. Select the report format (PDF, JSON, or CSV).
4. Click **Next**.
5. Configure the Filter, Frequency and Share pages as described in ["Configuring Custom Report" on page 136](#).
6. In the Confirm Submission page, verify the details and click **Schedule Report**.
7. The report will be generated per schedule and listed in the My Reports page.
 - Click the report name link to view the summary of the configured details.
 - Click the download icon located next to the report to view report in the specified format (PDF, JSON, or CSV)

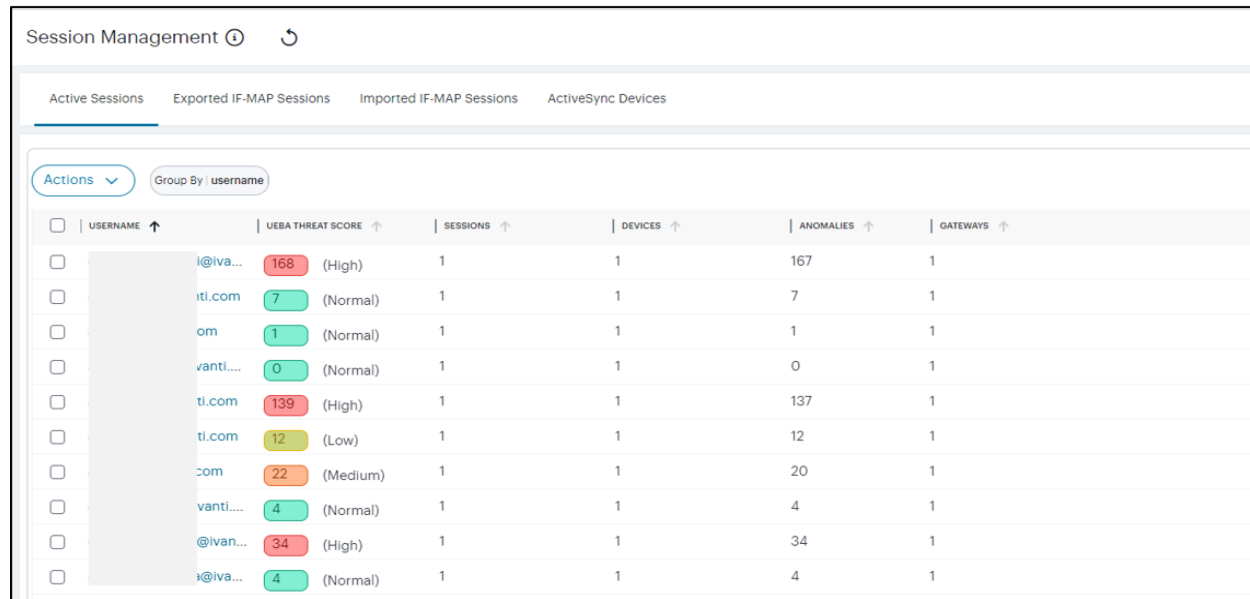

Managing the Sessions

Ivanti Connect Secure Sessions Management page allows you to manage the Active Sessions, Exported IF-MAP Sessions, Imported IF-MAP Sessions and ActiveSync Devices.

To navigate to Session Management page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select Ivanti Connect Secure from the Gateway Switcher (9 dots). See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. From the Ivanti Connect Secure menu, click the **Insights** icon, then select **Session Management > Active Sessions**.

The Session Management page is displayed. It presents the various sessions tabs to manage the sessions.

Session Management ⓘ ↻

<input type="checkbox"/>	i@iva...	4 (Normal)	1	1	4	1

3. The logs data presented can be sorted based on the column.
4. To move a column, click the header of the column and drag it to a desired new position.
5. To manually refresh the data, click the circular arrow:

Managing Active Sessions

To view Active Sessions:

1. In the Session Management page, select the **Active Sessions** tab.

The Users list is displayed.

2. Click the > icon that is present next to a user name.

An expanded list shows all the active sessions of that user.

Session Management ⓘ ↺

3. Use Advanced Filter to list based on Username, Gateways, or UEBA Threat.

To terminate user session:

1. In the Users list, click the > icon that is present next to the user name.

An expanded list shows all the active sessions of that user. .

2. Click the **Terminate User Session** icon available in the **Action** column corresponding to the session you want to delete.

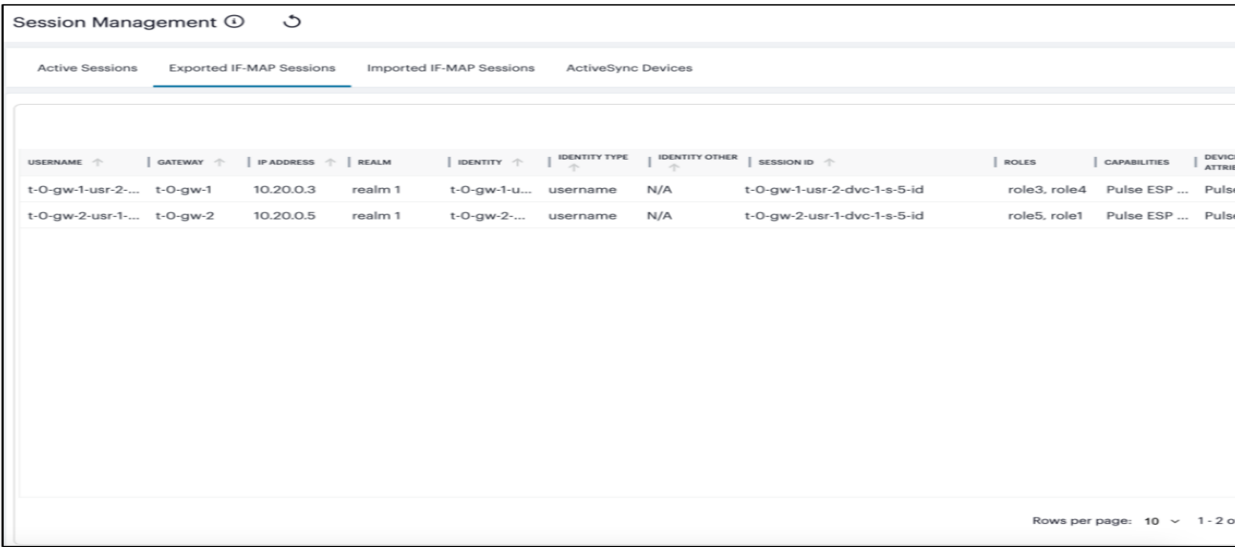

Viewing Exported IF-MAP Sessions

To view Exported IF-MAP Sessions:

1. In the Session Management page, select the **Exported IF-MAP Sessions** tab.

The Exported IF-MAP Sessions page is displayed. The page shows a list of Exported IF-MAP Sessions.

Session Management ⓘ ↺

t-0-gw-2-usr-1-...	10.20.0.6	t-0-gw-2	t-0-gw-2-usr-1-...	t-0-gw-2-usr-1-...	tenant0-10.20.0.6-city	role3	
<input type="checkbox"/> 05/24/2021 5:2...	t-0-gw-2-usr-2-...	10.20.0.8	t-0-gw-2	t-0-gw-2-usr-2-...	t-0-gw-2-usr-2-...	tenant0-10.20.0.8-city	role3
<input type="checkbox"/> 05/24/2021 5:2...	t-0-gw-1-usr-1-...	10.20.0.2	t-0-gw-1	t-0-gw-1-usr-1-...	t-0-gw-1-usr-1-...	tenant0-10.20.0.2-city	role3

- To remove session:

1. In the IF-MAP Imported Sessions page, select the check box(es) present next to the sessions that you want to remove, select **Actions** menu and click **Remove Selected**.
2. To remove all the sessions, select **Actions** menu and click **Remove All**.

1. In the Session Management page, select the **ActiveSync Devices** tab.

The ActiveSync Devices page is displayed. The page shows a list of devices.

The screenshot shows the 'ActiveSync Devices' tab selected in the top navigation bar. Below the navigation bar, there is a table with columns: DEVICE ID, GATEWAY NAME, SOURCE IP, ACCESS ALLOWED, DEVICE TYPE, LOCATION, OPERATING SYSTEM, SESSION DURATION, TIMESTAMP (GMT), and DEVICE REG. DATE. An 'Actions' dropdown menu is open over the first few rows of the table, showing options: Delete, Delete All, Block Access, and Allow Access. The table contains several rows of device data, including Ubuntu and Mac devices, with their respective gateway names, source IPs, access status (checked or X), and timestamps.

DEVICE ID	GATEWAY NAME	SOURCE IP	ACCESS ALLOWED	DEVICE TYPE	LOCATION	OPERATING SYSTEM	SESSION DURATION	TIMESTAMP (GMT)	DEVICE REG. DATE
t-gw-...	t-0-gw-2	10.20.0.8	✓	Ubuntu	tenant...	Ubuntu	20:48:53	06/14/2021 12:02 pm +00:00	06/14/2021 12:02 p...
t-gw-...	t-0-gw-1	10.20.0.8	✗	Ubuntu	tenant...	Ubuntu	20:50:...	06/14/2021 12:00 pm +00:00	06/14/2021 12:00 p...
t-gw-...	t-0-gw-2	10.20.0.8	✓	Mac	tenant...	Mac	1 day, 8...	06/14/2021 12:03 am +00:00	06/14/2021 12:03 a...
<input type="checkbox"/> t-0-gw-...	t-0-gw-...	t-0-gw-2	✗	Mac	tenant...	Mac	1 day, 8...	06/14/2021 12:01 am +00:00	06/14/2021 12:02 a...
<input type="checkbox"/> t-0-gw-...	t-0-gw-...	t-0-gw-1	✓	Mac	tenant...	Mac	1 day, 8...	06/14/2021 12:00 am +00:00	06/14/2021 12:00 a...

At the bottom right of the table, it says 'Rows per page: 10' and '1 - 5'.

2. You can sort the devices list based on the column.
3. Use Advanced Filter to list based on Username or Gateway.

To block/unblock one or more devices:

1. In the Session Management page, select the **ActiveSync Devices** tab.

The ActiveSync Devices page is displayed that shows a list of devices.

The Access Allowed column shows if the device is blocked/allowed for use. The tick mark means the access is allowed for that device.

2. To block a device, select the check box(es) next to the device that you want to block, select **Actions** menu and click **Block Access**.

The device is blocked, and a confirmation message is displayed.

3. To unblock a device, select the check box(es) next to the blocked device that you want to unblock, select **Actions** menu and click **Allow Access**.

The devices is unblocked, and a confirmation message is displayed.

To remove one or more devices:

1. In the Session Management page, select the **ActiveSync Devices** tab.

The ActiveSync Devices page is displayed. The page shows a list of devices.

2. To remove one or more devices, select the check box(es) next to the device that you want to remove, select **Actions** menu and click **Delete**.
3. To remove all the devices, select **Actions** menu and click **Delete All**.

Viewing Alerts and Notifications

The **Alerts** page lists all alerts and notifications that have been raised by nSA.

To view the **Alerts** page, click the **Alerts** icon and then click **See all Alerts**:

The **Alerts** page appears. For example:

Alerts ⓘ

Rows per page: 100 ▼					

The alerts table supports the following alert types:

- AAA Config Pull Failure
- AAA Config Pull Success
- AAA Config Pull Success - Failure Resolved
- AAA Journal Update Failed
- AAA Journal Update Success
- Config Sync Rule Deleted
- Config Sync Rule Updated
- Config Sync Target Cluster Deleted
- Custom Domain Certificate for mTLS Domain Due for Renewal
- Custom Domain Certificate for mTLS Domain Expired
- Custom Domain Certificate for TLS Domain Due for Renewal
- Custom Domain Certificate for TLS Domain Expired
- Device Vulnerability Risk Rating (VRR) Critical
- Device Vulnerability Risk Rating (VRR) High
- Device Vulnerability Risk Rating (VRR) Medium
- Device Vulnerability Risk Rating (VRR) Low
- Gateway Config Apply Failed
- Gateway Config Import Failed
- Gateway Disconnected
- Gateway Invalid Configurations Cleared
- Gateway Upgrade Failed

To filter the alerts table by type:

1. Click **Configure Alert Rules** icon.

The **Configure Alerts & Notifications** page appears.

2. Click **Alert Types** and select the required type.
3. Click **Close**.

To filter the alerts table by time period, click **Time Period** and select the required time period.

To sort the alerts table into ascending or descending order of a specific property, click on one of the following column headings in the alerts table:

- **Severity**
- **Type**
- **Message Type**

Working with Gateways

After you have successfully logged into the Ivanti Neurons for Secure Access (nSA) Controller as a Tenant Admin user (see ["Logging in to Ivanti Neurons for Secure Access" on page 24](#)), you can start the configuration of your nSA platform by adding Gateways.

nSA supports the following main Gateway types, depending on your subscription:

- Ivanti Neurons for ZTA Gateway
- Ivanti Connect Secure (ICS) Gateway
- Ivanti Virtual Traffic Manager Gateway

This chapter covers functionality relating to a nSA Gateway only. For details pertaining to a nZTA Gateway, see instead the "ZTA Tenant Administration Guide" in the Ivanti Neurons for Secure Access documentation portal.

Ivanti Connect Secure Gateway Management

Introduction

An admin can manage the ICS Gateway/Cluster with the following operations:

- **Restart Services:** Kills all processes and restarts the Gateway/Cluster. The Gateway/Cluster is available again after a few minutes. See ["Restarting Services" on page 156](#).
- **Reboot Gateway:** Reboots the Gateway. The Gateway is available again after a few minutes. See ["Rebooting ICS Gateway/Cluster" on page 157](#).
- **Reboot Cluster:** Reboots all nodes in the Cluster. See ["Rebooting ICS Gateway/Cluster" on page 157](#).
- **Rollback to <version>:** Reverts the registered Gateway virtual machine instance to the specified version. See ["Rolling Back a Gateway/Cluster" on page 157](#).
- **Rollback Cluster:** Reverts the cluster instance to the previous version. See ["Rolling Back a Gateway/Cluster" on page 157](#).

- **Upgrade to <version>**: Upgrades the registered Gateway virtual machine instance to the specified version. See ["Upgrading a Gateway and Cluster" on page 158](#)
- **Upgrade to <version> Cluster**: Upgrades all the nodes in the Cluster to the specified version. See ["Upgrading a Gateway and Cluster" on page 158](#).
- **Delete Gateway**: Removes the Gateway record. See ["Removing Ivanti Connect Secure Gateway" on page 167](#).
- **Configure Integrity Scanner**: Scans the system periodically to check for any integrity anomalies.
- **Upgrade multiple Gateways/Clusters to new version**: Upgrades multiple Gateways/Clusters to the specified version. See ["Upgrading Multiple Gateways and Clusters" on page 159](#).

The available menu options vary depending on whether the selected Gateway is registered and connected to the nSA.

Viewing ICS Gateway/Cluster Details

To view the list of ICS Gateways and Clusters:

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.

- From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The Gateways List page is displayed showing a list of standalone ICS Gateways and Cluster nodes.

STATUS	TYPE	GATEWAYS	CONNECTION STATUS	VERSION	STAGE
		Standalone ICS Gateways			
		cluster1			
		kirankotha114121	Disconnected	22.7R2.3-3393	N/A
		dd-clus-22x	Connected	22.9R2-32	N/A
		d-22x-vmw-d-166	Connected	22.9R2-32	N/A

- Use the Expand all / Collapse all icon () provided in the Gateways List page to expand / collapse the Clusters and Gateways lists.
- Use the Refresh icon () to manually refresh the data.
- Use the **Group by** option and select the field type (Gateway Type, Connection status, Version or Region) to view the table information in groups.
- Use the Search bar to filter the results list. For example, to show only those Gateways that match a search string.

The Gateway management functions can be performed only if the status of the Gateway is green.

To view the details of a specific Gateway:

1. In the All Gateways page, double-click the required Gateway from the Standalone Gateways list.

The Gateway Overview page is displayed showing the Gateway Status, Version, Registration State, and last Updated time.

GATEWAYS
gwpcsn121
● Gateway Ready

gwpcsn121	
STATUS	Online
VERSION	21.6R2-272
STATE	Registered
UPDATED	0d21h 43m ago

- Reboot
- Restart
- Rollback
- Upgrade
- Delete

2. Click the context menu icon present at the top-right of the page to access the options applicable to the selected Gateway.

To view the details of an Active-Active Cluster:

1. In the Gateways List page, double-click the Active-Active Cluster from the list.

The Gateway Overview page is displayed showing the Model, Cluster Name and Configuration of the Cluster.

GATEWAYS			
Test-9x			
MODEL		VA-SPE	
CLUSTER NAME		Test-9x	
CONFIGURATION		Active/Active	
STATUS	MEMBER NAME	INTERNAL ADDRESS	EXTERNAL ADDRESS
●	Node-1	10.204.56.153	10.204.48.250
●	Node-2	10.204.51.250	10.204.48.231

2. Click the context menu icon present at the top-right of the page to access the options applicable to the selected Cluster.

To view the details of an Active-Passive Cluster:

1. In the Gateways List page, double-click **Active-Passive Cluster** from the list.

The Gateway Overview page is displayed showing the Model, Cluster Name, Configuration, External and Internal VIP Owner, External and Internal VIP IPV4/IPV6 of the Cluster.

GATEWAYS				
IQ-VMW-3K				
MODEL	VA-SPE			
CLUSTER NAME	IQ-VMW-3K

INTERNAL VIP IPV6	fd66:3001:8e20:9ce9::93			
STATUS	MEMBER NAME	INTERNAL ADDRESS	EXTERNAL ADDRESS	NOTES
●	NODE-91	10.204.91.91	10.96.64.91	Enabled
●	NODE-92	10.204.91.92	10.96.64.92	Leader

2. Click the context menu icon present at the top-right of the page to access the options applicable to the selected Cluster.

Creating an ICS Cluster

Clusters define a collection of Gateways that operate as if they were a single machine. A cluster pair is used to refer to a cluster of two units and a multiunit cluster refers to a cluster of more than two units. Once two or more units are joined in a cluster, they act as one unit.

To create an ICS Cluster:

1. In the Gateways List page, click the **Create** drop-down list.
2. From the Gateway types list, select **ICS Cluster**.

The screenshot shows a modal window titled "Create ICS Gateway Cluster". It features a title bar with a refresh icon and an information icon. The main area contains four input fields: "MODEL" (dropdown), "VERSION" (dropdown), "ENTER CLUSTER NAME" (text input), and "MEMBERS" (dropdown). Below the "MEMBERS" field is an "ADD" button. At the bottom right, there are "CANCEL" and "CREATE CLUSTER" buttons.

3. Select the ISA **Model**.
4. Select the Gateway **Version**.
5. Enter a unique **Cluster Name**. Maximum 19 characters, only alphanumeric and hyphens are allowed between characters.
6. Select a member node and click **Add** to add the nodes.
7. Enable **Configuration Only Cluster** to limit data transfer between cluster nodes. User and session specific limits are only enforced on the node and not across the cluster.
8. Click **Create Cluster**.

i After creating a cluster from nSA, add subsequent nodes to the cluster from nSA only.

Restarting Services

To restart services:

1. In the Gateway Overview page, click the context menu icon at the top-right to access the options applicable to the selected Gateway or Cluster.
2. Select the **Restart Services** option.

The Gateway/Cluster is available again after a few minutes.

Rebooting ICS Gateway/Cluster

To reboot ICS Gateway:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable to the selected Gateway.
2. Select the **Reboot Gateway** option.

The Gateway is available again after a few minutes.

To reboot ICS Cluster:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable to the selected A/A or A/P Cluster.
2. Select the **Reboot Cluster** option.

The Cluster is available again after a few minutes.

Rolling Back a Gateway/Cluster

Your ICS Gateway/Cluster can be rolled back to a previously-installed version through the Tenant Admin Portal. You might want to return to an earlier version if, for example, you encounter an unforeseen issue with a newly-upgrading Gateway instance, or for testing purposes.

You can roll back to a version only where that Gateway instance has been previously upgraded through the Tenant Admin Portal, and only to the previously-installed version.

To roll back a Gateway to an earlier version:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable for the selected Gateway.

If a rollback function is available for this Gateway, a corresponding link is displayed in the drop-down menu:

2. Select the **Rollback to <version>** link.

As the rollback process starts, your Gateway remains operating on the current version and continues to serve traffic. After the earlier version is reinstated, the Gateway reboots and becomes unavailable for a short time.

If the procedure is successful, the new software version is displayed in the Gateway Overview page.

To roll back a Cluster to the previous version:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable for the selected Cluster.

If a rollback function is available for this Cluster, a corresponding link is displayed in the drop-down menu:

2. Select the **Rollback Cluster** link.

As the rollback process starts, your Cluster remains operating on the current version and continues to serve traffic. After the earlier version is reinstated, the Cluster reboots and becomes unavailable for a short time.

If the procedure is successful, the new software version is displayed in the Gateway Overview page.

Upgrading a Gateway and Cluster

Ivanti periodically creates and releases new software versions to address updates and issues, and to improve performance. As new version packages become available, you can trigger an upgrade for your Gateway/Cluster through the nSA to take advantage of the updates available in the new version.

To upgrade a Gateway to a higher version:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable for the selected Gateway.

If the upgrade function is available for this Gateway, a corresponding link is displayed in the drop-down menu:

2. Select the **Upgrade to <version>** link.

In some cases, there might be more than one version available. Select the version you want, or contact your support representative for details.

As the upgrade process starts, your Gateway remains operating on the current version and continues to serve traffic. After the upgrade to new version, the Gateway reboots and becomes unavailable for a short time.

If the procedure is successful, the upgrade task is marked with a status of "Success" and the new software version is displayed in the Gateway Overview page.

To upgrade a Cluster to a higher version:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable for the selected Cluster.

If the upgrade function is available for this Cluster, a corresponding link is displayed in the drop-down menu:

2. Select the **Upgrade to <version> Cluster** link.

In some cases, there might be more than one version available. Select the version you want, or contact your support representative for details.

As the upgrade process starts, your Cluster remains operating on the current version and continues to serve traffic. After the upgrade to new version, the Cluster reboots and becomes unavailable for a short time.

If the procedure is successful, the upgrade task is marked with a status of "Success" and the new software version is displayed in the Gateway Overview page.

Upgrading Multiple Gateways and Clusters

This feature allows you to upgrade one or more gateways and clusters in a tenant with a selected version.

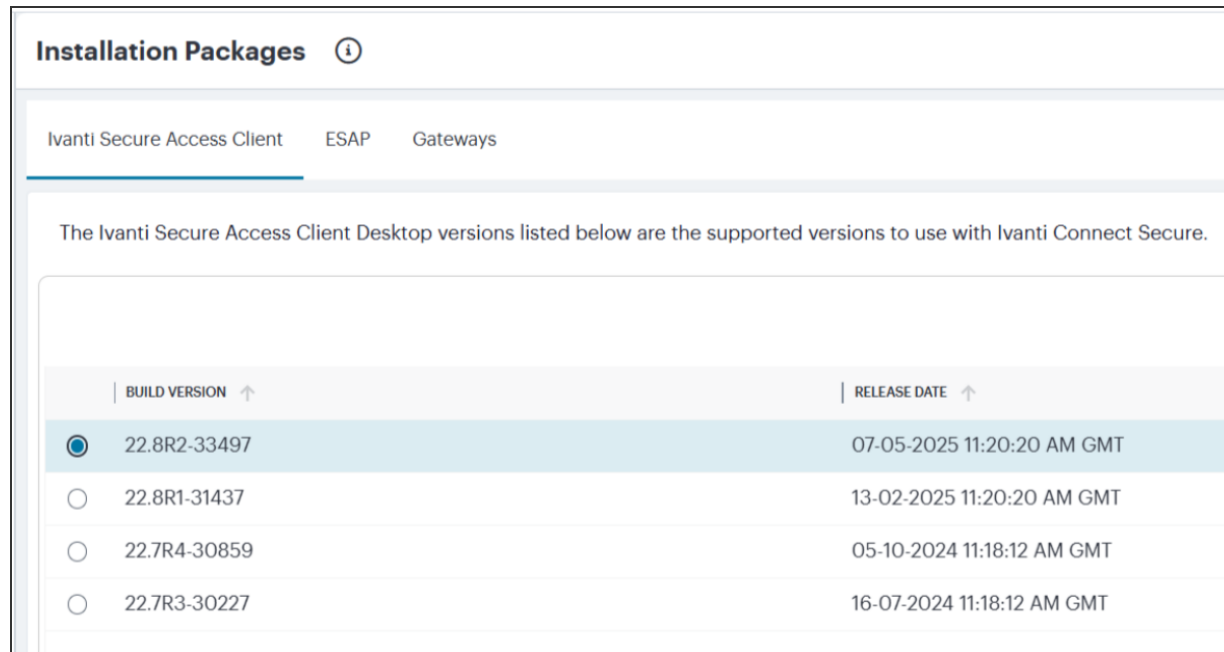

Upgrading Gateways and Clusters with Ivanti Secure Access Client

To upgrade one or more Gateways and Clusters with an Ivanti Secure Access Client package newer version:

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See "[Logging in to Ivanti Neurons for Secure Access](#)" on page 24.
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.
3. Select **Administration > Upgrade > Installation Packages**.

4. In the Installation Packages page, select the **Ivanti Secure Access Client** tab.

A list of available Ivanti Secure Access Client packages appears.

Installation Packages ⓘ

Ivanti Secure Access Client ESAP Gateways

The Ivanti Secure Access Client Desktop versions listed below are the supported versions to use with Ivanti Connect Secure.

BUILD VERSION ↑	RELEASE DATE ↑
<input checked="" type="radio"/> 22.8R2-33497	07-05-2025 11:20:20 AM GMT
<input type="radio"/> 22.8R1-31437	13-02-2025 11:20:20 AM GMT
<input type="radio"/> 22.7R4-30859	05-10-2024 11:18:12 AM GMT
<input type="radio"/> 22.7R3-30227	16-07-2024 11:18:12 AM GMT

5. Select any of the listed Ivanti Secure Access Client packages. This is the version of the Ivanti Secure Access Client software that you want users to have on their device.

As each user next logs into Ivanti Secure Access Client on their device, if their software is at a different version, Ivanti Secure Access Client provides a prompt to the user to change to the version you selected in nSA.

After the Client package download starts from nSA to ICS Gateway, any other operations in nSA, for example a Role or Realm creation and any configuration change, do not work unless the download is complete. After the successful download, config creations or modifications appear.

Upgrading Gateways and Clusters with ESAP

Downloading an ESAP Package

Download the Endpoint Security Assessment Plug-in from the Software Download Portal to your computer. You need to have the login credentials to access the portal.

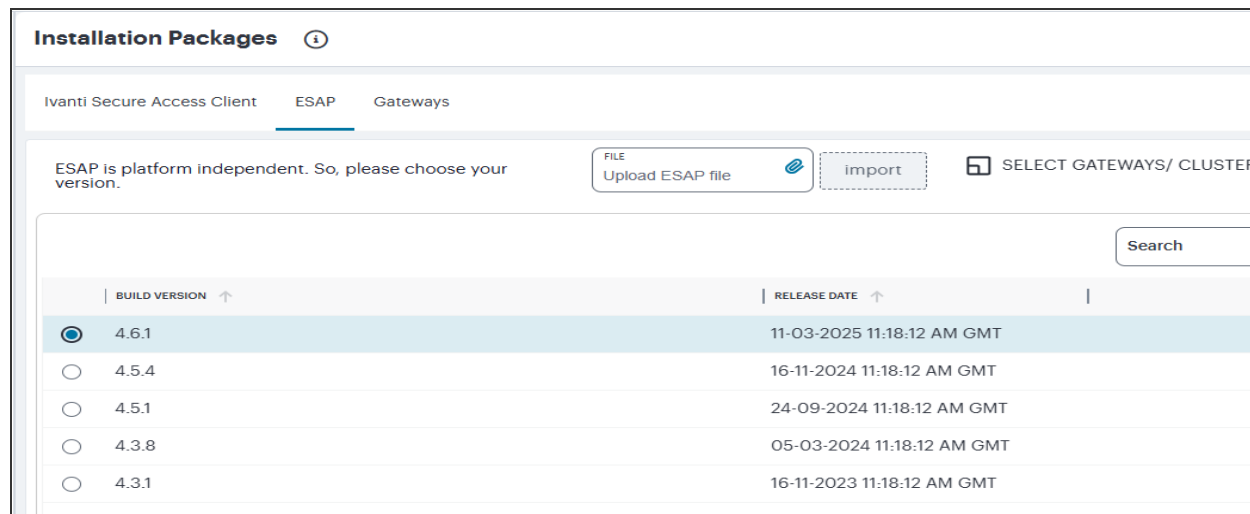

1. Open the [Software Download Portal](#) page.

2. Click the **Software** tab.
3. Navigate to the ESAP release you want, and click the link to download the package file to accessible local storage.

Uploading the ESAP Package

To upload the ESAP package that you downloaded from Software Download Portal:

1. Select **Administration > Upgrade > Installation Packages**.
2. In the Installation Packages page, select the **ESAP** tab.
3. Click the **Upload ESAP file** box.

4. Browse and select the latest ESAP package that you want to upload and then click **Import**.

After successful upload to nSA, the ESAP package gets listed in the ESAP packages page.

You can upload only one ESAP package.

Upgrading with ESAP

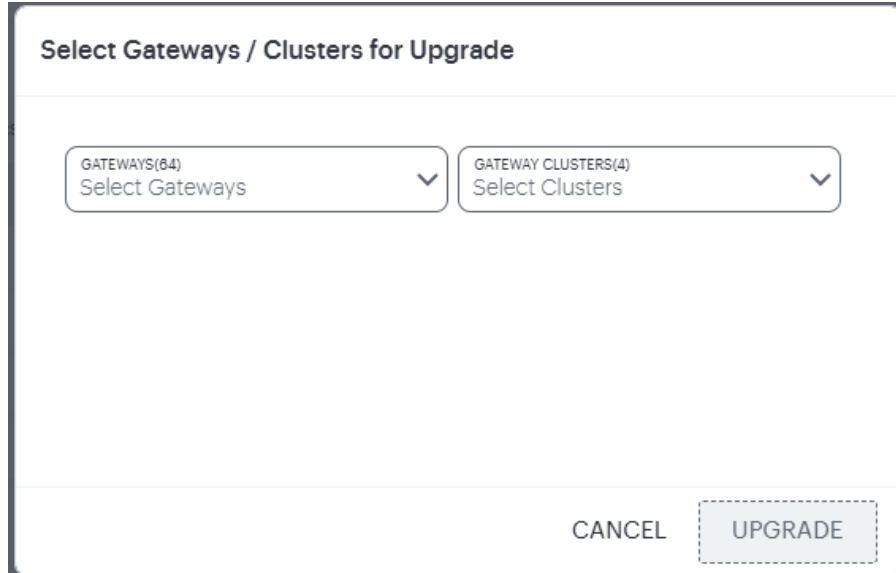

To upgrade one or more Gateways and Clusters to a newer ESAP package version:

1. Select **Administration > Upgrade > Installation Packages**.
2. In the Installation Packages page, select the **ESAP** tab.

3. Select the required build version from the list and click **Select Gateways/Clusters to Upgrade**.
4. In the Select Gateways / Clusters for Upgrade dialog, from the **Select Gateways** drop-down list, select one or more Gateways.

 The UI shows the applicable Gateways/Clusters running on version 21.12 and above.

5. From the **Select Clusters** drop-down list, select one or more Clusters.

 The Select Gateways and Select Clusters list shows only those Gateways and Clusters that have lower versions than the selected version.

6. Click **Upgrade**. The upgrade task is scheduled, and a notification is displayed in the logs.

 nSA deletes all the existing ESAP packages from the ICS Gateway after the upgrade and retains only the upgraded ESAP version.

Upgrading Gateways and Clusters with a New Gateway Version

To upgrade one or more Gateways and Clusters:

1. Select **Administration > Upgrade > Installation Packages**.
2. In the Installation Packages page, select the **Gateways** tab.

The Gateways page shows the list of installed packages of Connect Secure Gateway.

4. In the Select Gateways / Clusters for Upgrade dialog, choose one of the following:
- **Upgrade the Selected Gateways** - select one or more Gateways and click **Apply** to download the package and then install on the selected Gateways. The upgrade task is initiated, and a notification is displayed.
 - **Set up Stage Manually** - select one or more Gateways and click **Apply** to just download the package. Once the package is downloaded, an **Install** button appears in the **Status** column. Click **Install** to upgrade the selected Gateway.

The Gateway stage and upgrade from nSA is supported for ICS Gateway with base version 22.7R2.8.

- **Set up Stage on Scheduled** - select start date and time for downloading the package. Do one of the following:
 - Select one or more Gateways and click **Apply** to download the package at the scheduled date and time. The **Schedule** column shows the scheduled date and time. Once the package is downloaded, an **Install** button appears in the **Status** column. Click **Install** to upgrade the selected Gateway.
 - Choose the **Auto Download and Install** option, then select one or more Gateways, and click **Apply**. The auto download and install task is scheduled and a notification is displayed. The **Schedule** column shows the scheduled date and time.

6. In the Tenant Admin Logs page, see the logs generated for the Stage/Upgrade activities:

Sample Tenant Admin Logs page

The screenshot shows the 'Logs' page with a table of log entries and a 'Log Overview' sidebar on the right. The table has columns for User Name, Date, Time, Severity, Message ID, Source IP, Source, and Message. The Log Overview sidebar shows details for a specific log entry, including Severity (MAJOR), User Name, Date (2025-04-11), Time (11:49:30), Message ID (ADM32435), and Message (Created: Installation Pack ages > Gateways > 22.7R 2.8-4305 > schedule on: 2025-04-11 06:20:00 aut o-install: True Clusters: St age-Cluster).

Removing Ivanti Connect Secure Gateway

To remove Ivanti Connect Secure Gateway:

1. In the Gateway Overview page, click the context menu icon present at the top-right of the page to access the options applicable to the selected Gateway.
2. Select **Delete Gateway**.

The selected Gateway is removed from the list of Gateways.

Multinode Configuration Management

- ["Config Synchronization" below](#)
- ["Editing an Existing Config Sync Rule" on page 174](#)
- ["Removing Config Sync Rule\(s\)" on page 175](#)
- ["Cloning a Config Sync Rule" on page 176](#)

- ["Viewing Config Sync Rule Status" on page 181](#)
- ["Config Sync Alerts" on page 183](#)

The config synchronization feature supports simple configuration management across an enterprise without requiring you to deploy the systems as a cluster. You synchronize a partial configuration from the running configuration on the source system to the running configuration on one or more target systems. It supports configuring the entire configuration synchronization across multiple targets (up to 15 targets for entire configuration and 50 targets for selective configuration). This enhancement enhances flexibility and scalability for managing multiple gateways or clusters. This is particularly useful for enterprises with extensive networks, as it simplifies configuration management across various systems

nSA Config Authoring can handle multiple certificates with the same serial number.

- Disable Gateway Push Config while using nSA Config Sync.
 - Gateway Push Config fails if the configured admin account has MFA enabled on the target ICS server.
-

Config Synchronization

To configure config synchronization rule:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click **Gateways**, then click **Multinode Configuration** and then select **Config Synchronization**.

3. In the Config Synchronization page, click **Create Config Sync Rule**.

Cancel Review Dependencies Create

8. Look for any dependent configuration and select the required settings. The **Review Dependencies** button will appear at the bottom of the page.
9. Select the Mode: **Manual** or **Automatic**. Automatic option will sync the targets whenever there is change in source configuration.
10. Select the Action: **Merge** or **Replace**. The Merge option applies only changes in source to the targets, whereas the Replace option replaces the targets configuration with the source configuration.

11. To review the dependencies, click **Review Dependencies**.
 - To make any changes, click **Skip** and select the required dependencies.
 - To proceed with the changes, click **Select Dependencies and Proceed**.

12. Click **Create Config Sync Rule**.

The config sync rule gets listed in the Config Synchronization page under the **Config Sync Rule** tab..

Editing an Existing Config Sync Rule

To edit an existing config sync rule:

1. In the Config Synchronization page, click on the config sync rule name that you want to edit.
2. In the Edit Rule page, make the necessary changes. You cannot modify the rule name and source Gateway or Cluster.
3. Click **Update Config Sync Rule**.

- If Manual Mode is selected, then in the Config Synchronization page, select the check box corresponding to the config sync rule that you modified. Then select **Actions > Trigger Config Sync Rule**.

The Preview Config Sync Rule page appears.

CONFIG SYNCHRONIZATION ⓘ

Preview Config Sync Rule of preview-before-sync-desjardins

After previewing the configuration changes in the source gateway, trigger the selected rule.

Summary	Details

Modified: Authentication > Auth Servers > System Local	Modified: local -> settings -> password maximum length
	Modified: local -> settings -> password minimum length
	Modified: local -> settings -> password require alphabets
	Modified: local -> settings -> password require integer
Deleted: Authentication > Auth Servers > demo	Deleted: Authentication -> Auth Servers -> demo

Cancel

- Preview the config sync rule details, and click **Trigger Rule**.

 Preview before sync works only when one manual config sync rule is triggered.

Removing Config Sync Rule(s)

To delete one or more config sync rule(s):

1. In the Config Synchronization page, select the check boxes next to the config sync rule names that you want to delete.
2. Select **Actions > Delete**.
3. Click **OK** to confirm the deletion.

Cloning a Config Sync Rule

Cloning allows the admin to work on a copy of the original config sync rule and create a new rule.

To clone a config sync rule:

1. In the Config Synchronization page, identify the suitable config sync rule that you want to clone from the list.
2. Select the check box next to the config sync rule name.
3. Select **Actions > Duplicate Rule**.
4. In the Duplicate Config Sync Rule page displayed, edit the rule name. You cannot modify the source Gateway or Cluster.

Duplicate Config Sync Rule

5. Make required changes to the rule and dependencies. For details, see ["Config Synchronization" on page 168](#).
6. Click **Duplicate Config Sync Rule**.

The new rule gets listed in the Config Synchronization page.

Scheduling Config Sync Rule Job

Config sync rule, by default, executes periodically every 10 minutes. Admins may want to trigger one or more config sync rules across the target gateways at a specific time or periodically. Schedule jobs feature allows scheduling config sync rule job to run on a specific date and time, or to run daily or weekly or monthly frequencies.

Scheduling a Config Sync Rule Job

Scheduling One-time Job

To schedule a job for executing only once (On Demand Only):

1. In the Config Synchronization page, select the **Config Sync Rule** tab.

A list of config sync rules is displayed.
2. Select one or more check box(es) beside the config sync rule name that you want to schedule job.

Config sync rule cannot be part of more than one job.

3. From the **Actions** menu, select **Schedule Jobs**.
4. In the Schedule Jobs page, enter a unique name for the job.
5. Select the **On Demand Only** option.

6. Select the date and time for executing the job.

i Time is represented in Timezone set in the Timezone settings.

7. Click **Schedule Config Sync Rule**.

The new job is listed under the **Scheduled Jobs** tab.

Scheduling Recurring Job

To schedule a job for daily, weekly or monthly frequencies:

1. In the Config Synchronization page, select the **Config Sync Rule** tab.
A list of config sync rules is displayed.
2. Select one or more check box(es) beside the config sync rule name that you want to schedule job.
3. From the **Actions** menu, select **Schedule Jobs**.
4. In the Schedule Jobs page, enter a unique name for the job.
5. Select the **Recurring Scedule** option.

- Click **Schedule Config Sync Rule**.

The new job is listed under the **Scheduled Jobs** tab.

Editing a Scheduled Job

To edit a scheduled job:

1. In the Config Synchronization page, select the **Scheduled Jobs** tab.
A list of scheduled jobs is displayed.
2. Click the job name link that you want to modify.
3. Make the necessary changes and click **Schedule Config Sync Rule**.

Pausing/Resuming Scheduled Job(s)

To pause one of more scheduled jobs:

1. In the Config Synchronization page, select the **Scheduled Jobs** tab.
A list of scheduled jobs is displayed.
2. Select one or more jobs by clicking the check box(es) adjacent to the job name.
3. From the **Actions** menu, select **Pause Jobs**.
The **Status** column shows the job is paused.
4. To resume the job, select the paused job, and from the **Actions** menu, select **Resume Jobs**.
The **Status** column shows the job is scheduled.

Removing Scheduled Job(s)

To remove one or more scheduled jobs:

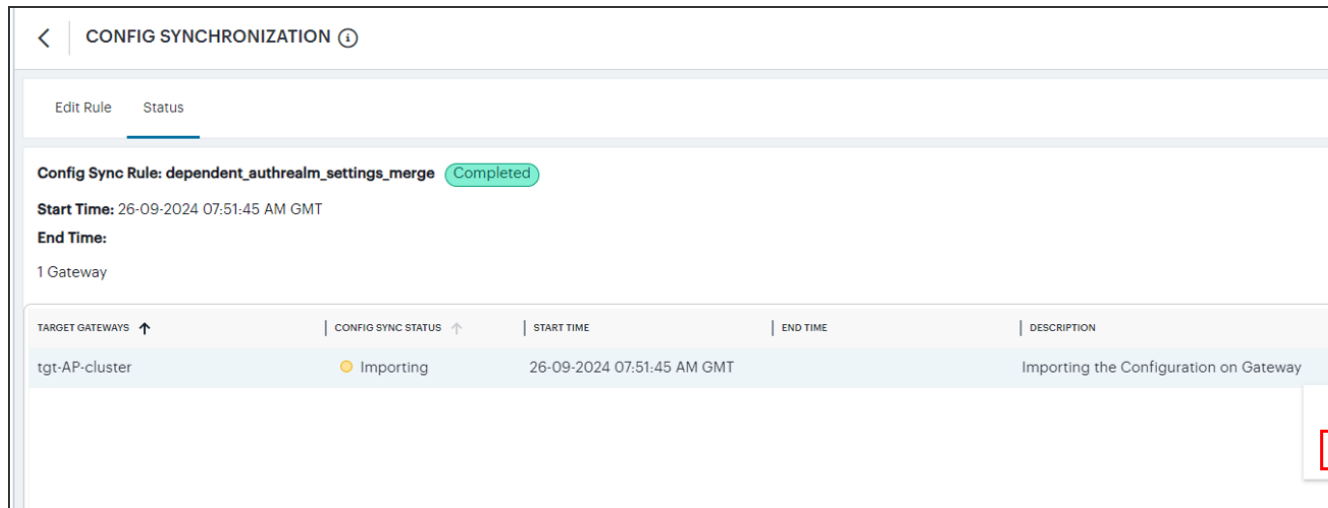

1. In the Config Synchronization page, select the **Scheduled Jobs** tab.
A list of scheduled jobs is displayed.
2. Select one or more jobs by clicking the check box(es) adjacent to the job name.
3. From the **Actions** menu, select **Delete Jobs**.

Viewing Config Sync Rule Status

To view the config sync rule status on the target gateways:

1. Click on the config sync rule name that you want to view the status.
2. Click the **Status** tab.

A list of target gateways, their config sync rule status, start and end time, and brief description is displayed. Start time and end time helps admin to know exactly when the config sync rule was triggered and when the config is imported on the ICS gateway.

The screenshot shows the 'CONFIG SYNCHRONIZATION' interface with the 'Status' tab selected. It displays details for a 'Config Sync Rule: dependent_authrealm_settings_merge' which is 'Completed'. Below this, it shows the 'Start Time' as '26-09-2024 07:51:45 AM GMT' and 'End Time' as blank. A section indicates '1 Gateway'. A table lists target gateways with columns for 'TARGET GATEWAYS', 'CONFIG SYNC STATUS', 'START TIME', 'END TIME', and 'DESCRIPTION'. One gateway, 'tgt-AP-cluster', is shown with a status of 'Importing' (indicated by a yellow circle icon) and a start time of '26-09-2024 07:51:45 AM GMT'. The description for this gateway is 'Importing the Configuration on Gateway'.

TARGET GATEWAYS ↑	CONFIG SYNC STATUS ↑	START TIME	END TIME	DESCRIPTION
tgt-AP-cluster	Importing	26-09-2024 07:51:45 AM GMT		Importing the Configuration on Gateway

3. Click **Reload Page** to view the latest status of all the gateways. The status includes:
 - Not Synced - Initial state
 - Pending - Configuration pushed to ICS gateway
 - Importing - Importing configuration on ICS gateway
 - Failed - Configuration import failed on ICS gateway
 - Successful - Configuration import successful on ICS gateway
 - Timed out - Timed out because the status stuck at Pending / Importing state for more than 2 hours
4. For the target gateways with status "Pending", Importing" or "Timed out", click **Refresh GW Status** that fetches the latest status from the gateway. The status and description columns are updated according to the latest status of the gateway.

Config Sync status history shows the history of previous states for each target gateway.

Config Sync Alerts

The following alerts are generated:

- Config Sync Rule Deleted - This alert is generated when the Config Sync rule is deleted.
- Config Sync Rule Updated - This alert is generated when the Config Sync rule is updated.
- Config Sync Target Cluster Deleted - This alert is generated when the Target Cluster, which is in the Config Sync rule, gets deleted.

Introduction

When you install and initially set up the device, you use the serial port console to set basic network and host settings. To get started, you must use the serial console to configure these settings for the internal interface. You have the option to use the serial console to configure network and host settings for the external interface and the management interface.

Once the internal interface has been configured, you can use the admin console Network Settings pages to modify settings for the internal interface, to enable and configure the external interface and the management interface, and to configure or manage advanced networking features, including:

- Hostname
- IPv6 addresses
- VLAN ports
- Virtual ports
- Route table entries
- Host mapping table entries
- ARP cache entries
- Neighbor discovery cache entries
- System date and time (manual configuration) or NTP

NTP Configuration

You can use the admin console to set the system date and time manually or by configuring a network time protocol (NTP) server. The system supports NTPv4, which is backwards compatible with NTPv3 and NTPv2.

We recommend you use NTP to synchronize the date and time clocks on all network systems. Using NTP obviates issues that might occur with cluster synchronization, network communication that uses time-sensitive protocols, such as SAML, and implementation of time-based policies, such as local authentication server account expiration. In addition, using NTP as a standard in your network rationalizes timestamps in logs, which facilitates reporting and troubleshooting.

To configure NTP:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the **Gateways > Gateways List** and then select any standalone ICS Gateway or Cluster node.
3. Navigate to **System > NTP** that displays the System Status page with *System Date and Time*.
4. Select your **Time Zone**. Selecting the appropriate time zone enables the system to automatically adjust the time for Daylight Saving Time changes
5. Select **Time Source**.
 - If **Use Pool of NTP Servers** is selected, configuring one NTP server is mandatory, but keys are optional. Click **Save Changes**.

It is not recommended to use only two NTP servers. If more than one NTP server is required, four NTP servers is recommended minimum. Four servers protect against one incorrect time-source.

If you are using NTPv4, specify the symmetric key. The key must be pre-synchronized with the NTP server. For example, if you want to configure NIST's clock as the NTP server, you must request a key beforehand and have NIST send that key to you.

- If **Set Time Manually** is selected, specify the **Date** and **Time** with **Time Slot**.
- Click **Get from Browser** to automatically populate the *Date* and *Time* fields. Click **Save Changes**.

Licensing Mode

You can use either Gateway licenses or nSA Named User licenses. You can switch between these two licensing modes any time. Gateway Licensing mode is same as the existing 9.x Gateway licensing.

To choose the licensing mode:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the *Gateways > Gateways List* and then select any standalone ICS Gateway and Cluster node.

- 3. Navigate to **System > Configuration > Licensing > Licensing Summary**. The License Summary page shows the two options, **Gateway Licensing Mode** and **nSA Named User Licensing Mode**. By default, *Gateway Licensing Mode* is selected.
- 4. Choose the required mode and click **Switch**. You can view the **Licensed capacity**.
- 5. Under **Installed license details** enter **License key(s)** in the field and click **Add**. You can view the nodes and corresponding license.

Security Configuration

Granular cipher selection provides an administrator the ability to select specific ciphers and the preferred ordering of the selected ciphers. This feature also provides presets like Suite and PFS. There are two tabs, Inbound OpenSSL options and Outbound OpenSSL options. With this feature admins can select the ciphers that TLS/SSL connections will use. The Inbound OpenSSL options apply to all incoming connections. Outbound OpenSSL options apply to the following services:

- Rewriter
- ActiveSync
- SCEP
- Syslog
- LDAPS

Inbound SSL Options

To enable the Inbound SSL options Mode:

1. Navigate to **System > Configuration > Security > Inbound SSL Options**.
2. Click on **Turn on JITC mode** check box.
3. Once Turn on JITC mode is enabled, Turn on NDcPP mode and Turn on FIPS mode are also automatically enabled.

4. In **Inbound settings**, select **Allowed SSL and TLS Version** and **Allowed Encryption Strength**.

NDcPP mode can be enabled in the Inbound tab with a check box. This status is also applied over to the Outbound tab. Turning on NDcPP automatically turns on FIPS mode and disables SSL/TLS Version TLS1.0 and below. Also, NDcPP Mode allows to choose only 16 Ciphers under Custom Encryption Strength.

Inbound SSL Options

SSL JITC Mode option

☐ **Turn on JITC mode**

When this option is enabled, the web service will be placed in JITC Mode. NDcPP and FIPS Modes will also be turned on and all non-FIPS ciphers will be disabled. The web service will restart.

SSL NDcPP Mode option

☐ **Turn on NDcPP mode**

When this option is enabled, the web service will be placed in NDcPP Mode. FIPS Mode will also be turned on and all non-FIPS ciphers will be disabled. The web service will restart. NDcPP Mode is a prerequisite for JITC Mode.

SSL FIPS Mode option

☐ **Turn on FIPS mode**

When this option is enabled, the web service will be placed in FIPS Mode, the cipher strength will be set to Medium, and all non-FIPS ciphers will be disabled. The current cipher customization might be lost. The web service will restart. FIPS mode is a prerequisite for NDcPP Mode.

Inbound Settings

☐ **Enable TLS 1.3**

Allowed SSL and TLS version
Accept only TLS 1.2 and later

Allowed encryption strength
Maximize Security (High Ciphers)

Show Selected Ciphers

Note: Custom cipher selection disables the Encryption Strength option.
Note: Some ciphers may require an ECC certificate. Not all ciphers are supported by all clients.

Supported Ciphers 14

☐ **Select All**

- ☐ TLS_RSA_WITH_AES_128_GCM_SHA256
- ☐ TLS_RSA_WITH_AES_128_CBC_SHA256
- ☐ TLS_RSA_WITH_AES_128_GCM_SHA256
- ☐ TLS_RSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
- ☐ TLS_DHE_RSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256

Selected Ciphers 9

☐ **Select All**

- ☐ TLS_RSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_RSA_WITH_AES_256_CBC_SHA256
- ☐ TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- ☐ TLS_AES_128_GCM_SHA256

Encryption Strength option

☐ **Do not allow connections from browsers that only accept weaker ciphers**

Normally, the allowed encryption strength is enforced after an SSL session is established, so that a user that connects using a disallowed encryption strength will receive a web page describing the problem. The option below will prevent a browser with a weak cipher from establishing a connection. Changing this option will cause the web service to restart.

Key Exchange Options

Key Exchange options
2048

If the Allowed Encryption Strength includes any DH ciphers, the system uses 2048bit DHE key exchange by default. The options below will increase key exchange strength to 8192bit DHE. The selected key size will be the minimum key size supported in Ivanti Connect Secure.

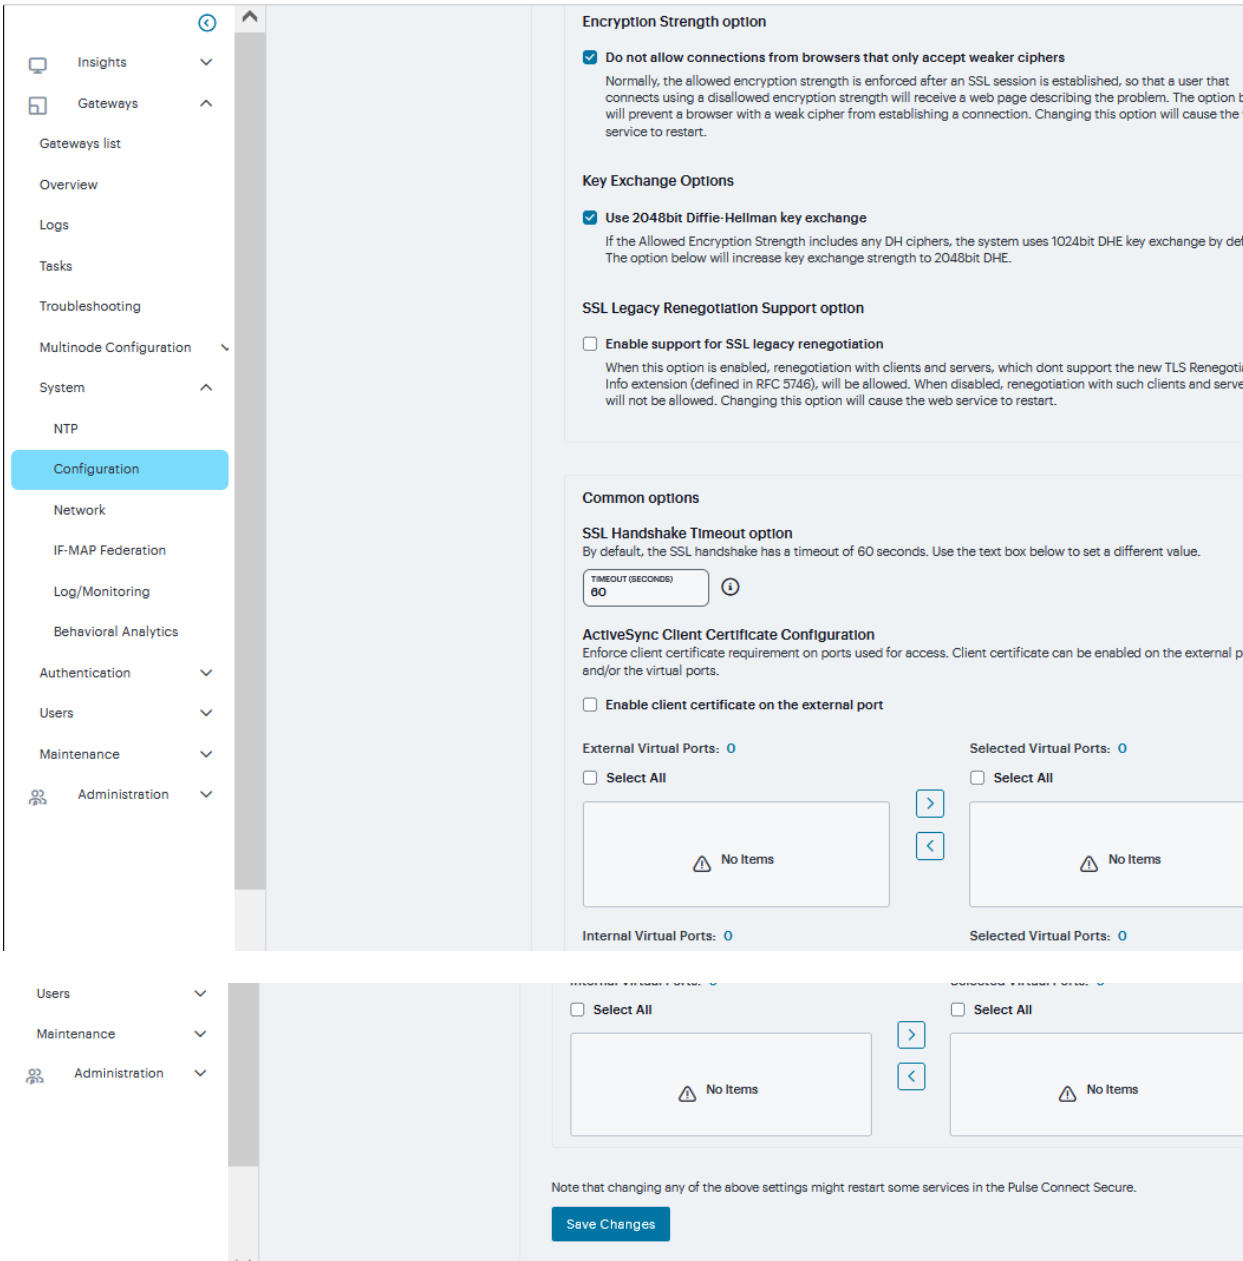

SSL Legacy Renegotiation Support option

☐ **Enable support for SSL legacy renegotiation**

When this option is enabled, renegotiation with clients and servers, which don't support the new TLS Renegotiation Info extension (defined in RFC 5746), will be allowed. When disabled, renegotiation with such clients and servers will not be allowed. Changing this option will cause the web service to restart.

5. The two panels of **Supported Ciphers** and **Selected Ciphers** are displayed. Supported ciphers has the entire list of ciphers supported for the selected SSL or TLS version. Selected ciphers list the currently selected ciphers list.
6. Select **Encryption Strength option** to strengthen the SSL session that is established.
7. Select **Key Exchange Options** to increase the key exchange strength to 2048bit DHE.
8. Select **Enable support for SSL legacy renegotiation** to allow new TLS Renegotiation Info extension.
9. Select **Enable port redirection for TLSv1.3 certificate authentication** to change the client-certificate authentication over TLSv1.3 connections with Port: 8443.
10. Set **SSL Handshake Timeout option**
11. Select **Enable client certificate** to enable Client certificate on the external port and/or the virtual ports.
12. The two panels of **External Virtual Ports** and **Selected Virtual Ports** are displayed. External Virtual Ports has the entire list of ports available for the selected certificate. Selected Virtual Ports list the currently selected ports list.
13. The two panels of Internal Virtual Ports and Selected Virtual Ports are displayed. Internal Virtual Ports has the entire list of ports available for the selected certificate. Selected Virtual Ports list the currently selected ports list. You can move the virtual ports from the external/internal to selected list and vice versa.

14. Click **Save Changes**.

Outbound SSL Options

To enable the Outbound SSL options Mode:

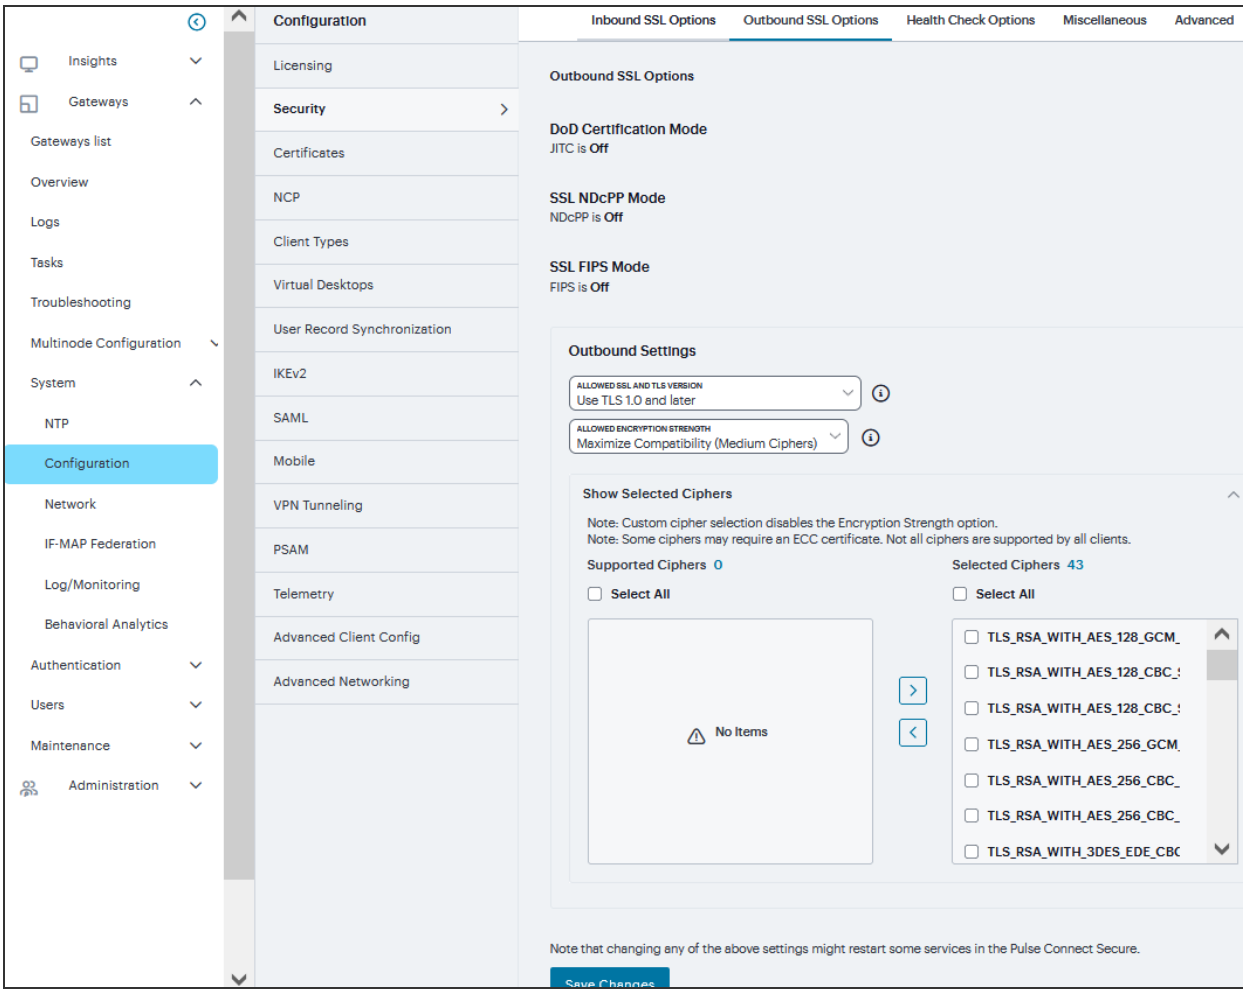

1. Navigate to **System > Configuration > Security > Outbound SSL Options**.

Only for Outbound SSL Settings, we can configure Non FIPS Ciphers when FIPS is Enabled using Custom Cipher Selection Option. Now, there are options to change different SSL/TLS versions and different encryptions in the Outbound SSL Settings.

2. **DoD Certification Mode**, **SSL NDcPP Mode**, and **SSL FIPS Mode** are OFF all these can be enabled from **Inbound SSL options** tab.
3. In **Outbound settings**, select **Allowed SSL and TLS Version** and **Allowed Encryption Strength**
4. The two panels of **Supported Ciphers** and **Selected Ciphers** are displayed. Supported ciphers has the entire list of ciphers supported for the selected SSL or TLS version. Selected ciphers list the currently selected ciphers list. The following figure shows the two panels (Supported Ciphers and Selected Ciphers). Note that the Selected Ciphers and Supported Ciphers List will also be displayed for all Preset like PFS or Suite B or Medium or High.

5. Click **Save Changes**.

Health Check Options

To configure health check options:

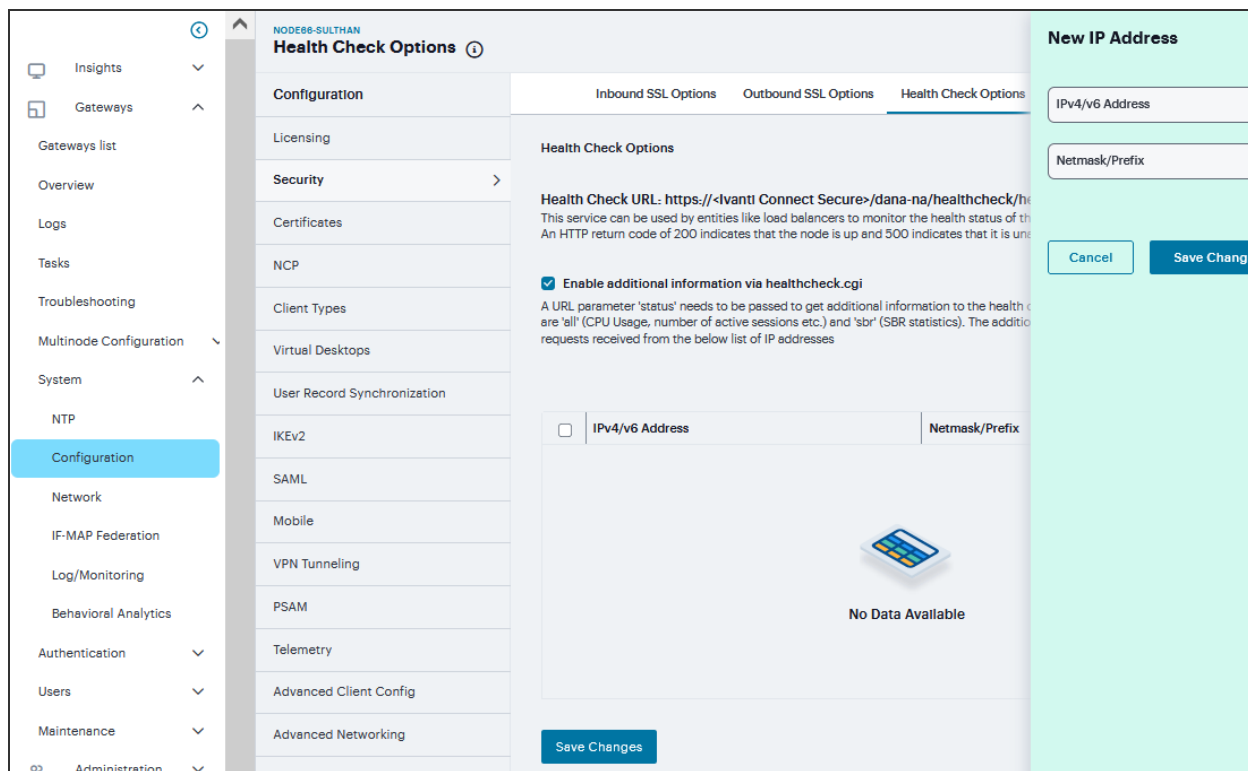

1. Navigate to **System > Configuration > Security > Health Check Options** to display the configuration page.

Enable additional information via healthcheck.cgi-This option is used by entities like load balancers to monitor the health status of the node.

2. Select the **Enable additional information via healthcheck.cgi** check box.

3. Click '+' to add the relevant IPv4/v6 addresses for which additional information is required to be made available.
4. Click **Save Changes**.

Miscellaneous Setup

You can use the **System > Configuration > Security > Miscellaneous** page to configure the following security options:

- **Persistent cookie options** - You can choose whether to preserve or delete persistent cookies when a session is terminated.
- **Lockout options** - You can configure lockout options to protect the system from denial of service (DoS), distributed denial of service (DDoS), and password-guessing attacks.
- **Last login** - You can choose whether to show users the time and IP address their user ID was used to sign in.
- **X-Frame-Options protection** - You can choose to defend against click-jacking attacks by adding X-Frame-Option header to all the IVE generated pages. If this is not enabled, then only welcome.cgi will have this header.

- **Slow Post Attack Defense** - You can configure to protect against slow-post DOS attacks from non-authenticated users.
- **HSTS** - HTTP Strict Transport Security (HSTS) is a HTTP special response header which will prevent any communications over HTTP
- **Booting Options on Integrity Check Failure** - You can configure to protect against integrity attacks.
- **Host Header Validation** – You can block open redirect attacks
- **Username Validation** – You can block unauthorized access
- **Integrity checking options** - You can configure scan the system to periodically check for any integrity anomalies. If any anomaly found, information is displayed in the dashboard.

To configure cookie and lockout options:

1. Select **System > Configuration > Security > Miscellaneous** to display the configuration page.
2. Complete the configuration as described in the following table.

3. Click **Save Changes**.

100

LOCKOUT PERIOD (MINUTES)

2

Last Login options

☐ Show last login time on user's bookmark page

☐ Show last login IP address on user's bookmark page

The following settings determine whether to show the user's last login time and source IP address details on the user's bookmark page. For Admin users this information will be displayed on the System Status page. These settings do not apply to the custom start page option on Role UI options page.

X-Frame-Options protection

☒ Enable X-frame options protection

Enable X-Frame-Options protection to defend against click-jacking attacks by adding X-Frame-Option header to all the Pulse generated pages. If this is not enabled then only welcome.cgi will have this header

SYN FLOOD, SMURF, SSL Replay Attack Audit Logs

☐ Enable SYN Flood, SMURF, SSL Replay Attack Audit

Enable SYN Flood, Smurf and SSL replay attack audit logs. Turning this on can have performance and resource impact. Even when turned off, the device is always protected against these attacks. This option controls only the logging for these attacks. This option needs to be on when the device is in J/T/C Mode

Settings	Guidelines
Delete all cookies at session termination	
Delete / Preserve	For convenience, the system sets persistent cookies on the user's machine to support functions such as multiple sign-in, last associated realm, and the last sign-in URL. For additional security or privacy, you can choose not to set them.
Include Ivanti Connect Secure's session cookie in URL	
Include / Not Include	Mozilla 1.6 and Safari may not pass cookies to the Java Virtual Machine, preventing users from running JSAM and Java applets. To support these browsers, the system can include the user session cookie in the URL that launches JSAM or a Java applet. By default, this option is enabled, but if you have concerns about exposing the cookie in the URL, you can disable this feature.
Lockout options	
Rate	Specify the number of failed sign-in attempts to allow per minute.

Settings	Guidelines
Attempts	Specify the maximum number of failed sign-in attempts to allow before triggering the initial lockout. The system determines the maximum initial period of time (in minutes) to allow the failed sign-in attempts to occur by dividing the specified number of attempts by the rate. For example, 180 attempts divided by a rate of 3 results in an initial period of 60 minutes. If 180 or more failed sign-in attempts occur within 60 minutes or less, the system locks out the IP address being used for the failed sign-in attempt.
Lockout period	Specify the length of time (in minutes) the system must lock out the IP address.
Last Login options	
Time / IP Address	Display the day and time and IP address the user last logged in to the system. For users, this information appears on their bookmark page. For administrators, this information appears on the System Status Overview page. These settings do not apply to the custom start page option on Role UI Options page.
X-Frame-Options protection	
Enable X-Frame-Options protection	By default, the Enable X-Frame-Options is checked. If the admin does not want to have this protection, they can uncheck this option. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page in a <frame>, <iframe> or <object>.
SYN FLOOD,SMURF,SSL Replay Attack Audit Logs	Turning this on can have performance and resource impact. Even when turned off, the device is always protected against these attacks. This option controls only the logging for these attacks. This option needs to be on when the device is in JITC Mode
Limit SYN requests per source IP	To limit the number of SYN requests per source IP to prevent DOS attacks.

Settings	Guidelines
Limit SYN requests per system	To limit the number of SYN requests per system to prevent DDOS attacks.
Slow Post Attack Defence	
Timeout	By default, the POST body is received within 10 seconds. If the browser is unable to send the POST body within 10 seconds the connection is eventually dropped. (Configurable from 3 - 60Sec)
Maximum Request Size	By default, now a connection is directly rejected if it tries to POST more than 4KB in POST body (Configurable from 256 Bytes to 24 KB)
HSTS	
Max Age	Specify the maximum age for HSTS. It can be disabled by configuring max age as 0.
Enable includeSub-domain directive	Select the check box to enable/disable the includeSubdomain directive. By default, it is turned off.
Enable preload directive	Select the check box to enable/disable the preload directive. By default, it is turned off.
Bootimg Options on Integrity Check Failure	
Bootimg Options on Integrity Check Failure to stop booting if manifest integrity validation fails	<p>Select the check box to enforce booting options on integrity validation. By default, it is turned off.</p> <p>The following integrity checks are performed:</p> <p>Checks the SHA512 digital signature of the manifest file.</p> <p>Checks the SHA256 digest of each individual file entries in the manifest.</p> <p>If enabled and integrity check fails, admin needs to roll back to previous working package or perform factory reset.</p>
Host Header Validation	
Enable Host header validation to block open redirect attacks	Select the check box to enforce host header validation. By default, it is turned off.

Settings	Guidelines
	When Host header validation is enabled, every http request will be validated against hostnames and IP v4/v6 addresses known to the ICS server. If match is not found, the request will be dropped and logs are recorded in admin access logs and user access logs, and a response will be sent back to client.
Username Validation	
Enable Username validation to block unauthorised access	Select the check box to enforce username validation for usage of unsupported characters. Max allowed length for username is 128 characters.
Runtime Integrity Scanner Interval	
Periodic Scan	Select the time interval to run the integrity scanner during run time. For example: Select 2 hrs to run the integrity scanner every 2 hrs.
Scheduled Scan	Select to run integrity scanner at a specified time everyday. For example: When 13 hr 25 min is specified, the scanner runs at the same time everyday.
Referer Header Validation	
Enable Referer Header validation to block CSRF attacks	Select the check box to enable referer header validation.
Active Directory Encryption type	
Enable AES 256 type encryption for Active Directory Authentication Server	Select the check box to enable AES256 encryption type. If enabled, this option changes the encryption type to AES256 for all Active Directory Authentication Server using Kerberos Authentication Protocol. This Feature is applicable only for Active Directory Authentication Server using Kerberos Authentication protocol.
Relay State Validation	

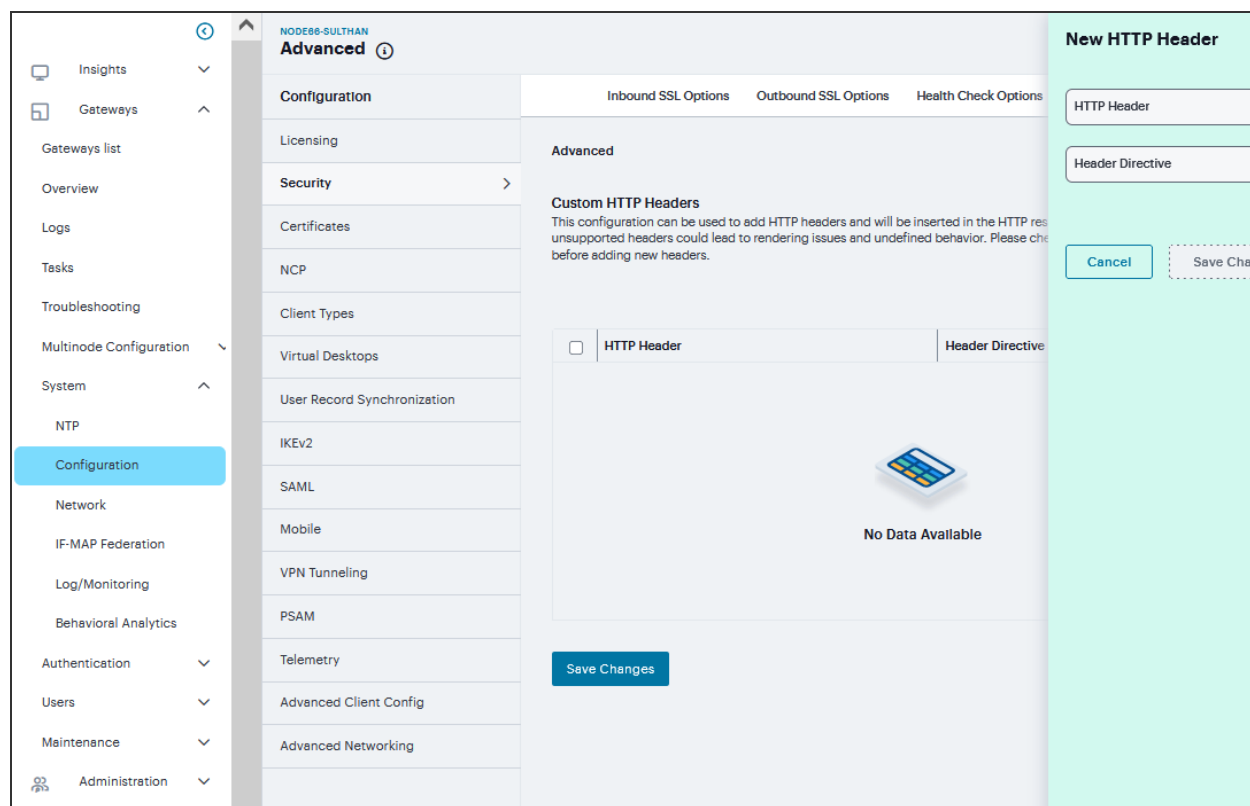

Settings	Guidelines
Enable Relay State Validation for SAML Authentication Server	Relay State validation can be configured under System > Configuration > Miscellaneous . It is enabled by default in 22.5R2.1.

Advanced Configuration

Connect Secure supports several HTTP headers, which are sent in response to the client request. There are several more headers built to improve security and prevent attacks like XSS. The Custom HTTP Headers configuration enables the administrator to add new headers that they want to enforce.

To configure custom HTTP header:

1. Navigate to **System > Configuration > Security > Advanced**
2. Click '+' to Add the relevant **HTTP Header** and **Header Directive**.
3. Click **Save Changes**

Certificates Configuration

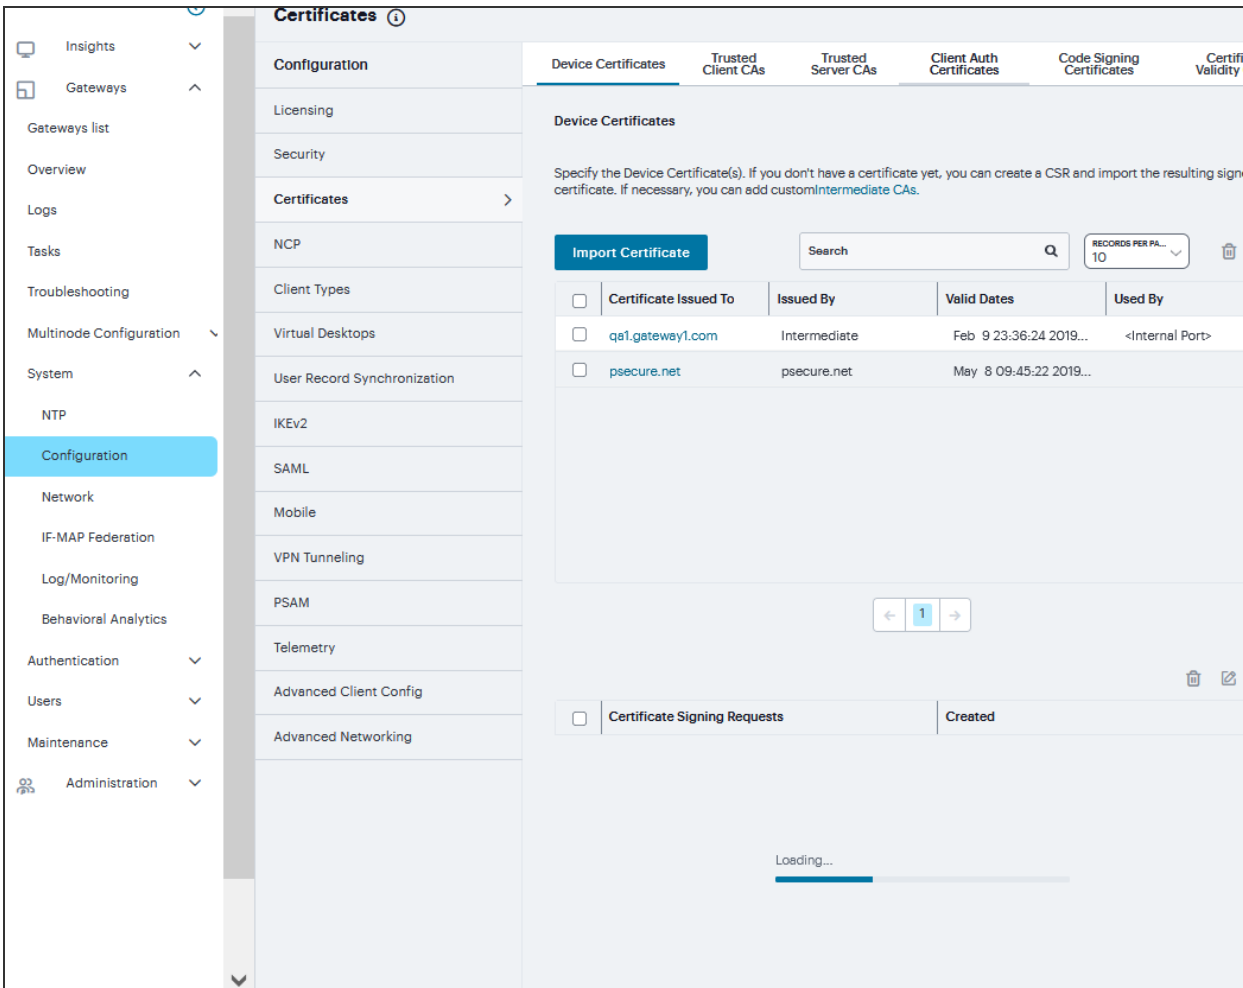

Connect Secure uses Public Key Infrastructure (PKI) to secure the data sent to clients over the Internet. PKI is a security method that uses public and private keys to encrypt and decrypt information. These keys are enabled and stored through digital certificates. A digital certificate is an encrypted electronic file issued by a certificate authority (CA) that establishes credentials for client/server transactions.

Device Certificates

A device certificate helps to secure network traffic to and from the Ivanti Secure Access client service using elements such as your company name, a copy of your company's public key, the digital signature of the Certificate Authority (CA) that issued the certificate, a serial number, and an expiration date. When receiving the device certificate from the system, the client's browser first verifies whether the device certificate is valid and whether the user trusts the CA that issued the certificate. If the user has not already indicated that they trust the certificate issuer, the Web browser prompts the user with a warning saying connection is untrusted or there is a problem with the websites security certificate.

To import an enterprise root server certificate and private key:

1. Select **System > Configuration > Certificates > Device Certificates**.
2. Click **Import Certificate** to display the configuration page.

3. Complete the configuration described in table.
4. Click **Import**.

To create Certificate Signing Request (CSR) for RSA and ECC Keys:

1. Navigate to **System > Configuration > Certificates > Client Auth Certificates**.
2. Click '+' on the **Certificate Signing Requests** pane.

3. Enter the required requestor information. In this example, the common name is *ecc-p256.<orgname>.net* or *ics.<orgname>.net*.
 - If **RSA** is selected, then select **Key Length** and enter **Random characters**.
 - If **ECC** is selected, then select **ECC Curve** drop-down.
4. Click **Save Changes**.
5. The CSR is encoded and can be copied or saved to a file. The ECC certificate should be signed by an RSA/ECC CA for Suite B compliance. Follow your CA's process for sending a CSR.
6. Click the **Back to Device Certificates** link. Until you import the signed certificate from your CA, your CSR is listed as Pending.

New Certificate Signing Request ⓘ

Trusted Client CAs

A trusted client CA is a CA that you deem trusted by adding it to the trusted client CA store. The system trusts any certificate issued by that CA. To use client CA certificates, you must install and enable the proper certificates. Additionally, you must install the corresponding client-side certificates in your users' Web browsers, or you must use the MMC snap-in in your users' computer accounts (machine certificate). When validating a client-side CA certificate, the system verifies that the certificate is not expired or corrupt and that the certificate is signed by a CA that the system has been configured to recognize. If the CA certificate is chained, the system also follows the chain of issuers until it reaches the root CA, validating each issuer in turn. The system supports X.509 CA certificates in DER and PEM encode formats.

To import a trusted client CA certificate:

1. Navigate to **System > Configuration > Certificates > Trusted Client CAs** to display the configuration page.

The screenshot displays the 'Trusted Client CAs' configuration page. On the left is a navigation menu with 'Configuration' selected. The main content area has tabs for 'Device Certificates', 'Trusted Client CAs' (active), 'Trusted Server CAs', 'Client Auth Certificates', 'Code Signing Certificates', and 'Certificate Validity Checking'. Below the tabs, there's a 'PORT SELECTION FOR OCSP AND CRL TRAFFIC' dropdown set to 'Internal Port' and a 'Save Changes' button. A note states: 'Note: Port Selection settings are node-specific. Please configure the settings individually for different nodes in cluster.' Below this, there are buttons for 'Auto Import Options', 'Proxy Settings', and 'Import CA Certificate'. A search bar and 'RECORDS PER PAGE' dropdown (set to 10) are also present. The main table lists the following CAs:

Trusted Client CA	Trusted For Client Authentication?	Valid Dates	Status Checking
<input type="checkbox"/> msrootca	Yes	2008/07/15 - 2028/07/15	None
<input type="checkbox"/> AutoEnterprise-CA	Yes	2016/05/21 - 2026/05/21	None
<input type="checkbox"/> Zero	Yes	2019/08/20 - 2039/08/15	None
<input type="checkbox"/> fruit-ORANGE-CA	Yes	2013/12/13 - 2038/12/13	None
<input checked="" type="checkbox"/> Root	Yes	2018/03/14 - 2038/03/09	None
<input type="checkbox"/> Intermediate	Yes	2018/03/15 - 2028/03/12	None
<input type="checkbox"/> *client,CA,pcs-qa.e.ash.pz	Yes	2022/05/08 - 2024/05/08	None

2. Click **Import CA Certificate** to display the configuration page.

- 3. Browse to the *Certificate File*, select it, and click **Import** to complete the import operation.

Import Trusted Client CA ⓘ

Use the form below to import an existing certificate. If the file is encrypted, you will also need to specify the password.

Auto-Import Options Settings

Setting	Guidelines
Auto-import trusted CAs	Select this option to enable auto-import and display its configuration settings.

Setting	Guidelines
Client Certificate Status Checking	<p>Select a method to validate the trusted client certificate:</p> <ul style="list-style-type: none"> • None-Do not validate. • Use OCSP-Use the OCSP method, validating the client certificate in real-time, as needed. After you select this option, you can specify options for OCSP. • Use CRLs-Use CRLs to validate the client certificate. After you select this option, you can specify options for CRL. • Use OCSP with CRL fallback-Use the OCSP validation method when possible, but attempt to validate client certificates using CRLs if the OCSP method fails (for example, if the link to the OCSP responder fails). After you select this option, you can specify options for OCSP and CRL. Inherit from root CA-Use the method configured for the device certificate.
CDP(s)/OCSP responder	<p>Select the location of the responder value:</p> <ul style="list-style-type: none"> • None-Do not use the responder. • From client certificate-Use the responder value configured in the client certificate. • From trusted CA certificate-Use the responder value configured in the trusted CA certificate that has been uploaded to the system.
Verify imported CA certificates	<p>Select this option to verify that this trusted client CA is valid. Enabling this will check the CRL of this certificate's issuer, and repeat up the chain until reaching the root trusted client CA.</p>
Skip Revocation check when OCSP/CDP server is not available	<p>Select this option to instruct ICS to skip revocation check and accept end user certificates when either OCSP server or CDP server is not accessible over the network. This option is applicable to digital certificates used for end user authentication.</p>

Setting	Guidelines
	<p>The OCSP Timeout, applicable only for OCSP, is used as the maximum timeout for a network connection or data transfer operation while connecting to an OCSP Responder. An internal timeout will be used for CDP.</p> <p>ICS skips the revocation check in the following conditions:</p> <ul style="list-style-type: none">• Server IP is not reachable• Server Hostname is either not resolvable or resolving to non OCSP/CRL• Server IP• Proxy IP is either not reachable or not resolving• Downloaded CRL has expired• OCSP/CRL service in Server is not responding.

To configure a proxy server:

1. Select **System > Configuration > Certificates > Trusted Client CAs**.
2. Click **Proxy Settings** to display the page.
3. Complete the configuration described in Proxy Settings table.
4. Click **Save Changes**.

Proxy Settings ⓘ

☐ Use Proxy Server for HTTP-based CRL download

☐ Use Proxy Server for HTTP-based OCSP status checking

Save C

Proxy Settings

Setting	Guidelines
Use Proxy Server for HTTP-based CRL download	Select to enable the CRL operations to use a proxy server. You can configure a proxy server for web-based URLs, not LDAP URLs.
Use Proxy Server for HTTP-based OCSP status checking	Select to enable the OCSP operations to use a proxy server.
Host Address	Specify either an IP address or a fully qualified domain name.
Port	Enter the proxy server port number if it is different from the default value of 80.
Username/password	If your proxy server required authentication, enter a username and password to log in to the proxy server.

Trusted Server CAs

All of the trusted root CAs for the Web certificates installed in Internet Explorer are preinstalled. You might need to install a trusted server CA for additional Web servers in the following situations:

- If you are using third-party integrity measurement verifiers (IMVs) that are installed on a remote server, you must upload the trusted root certificate of the CA that signed the remote server's server certificate.
- If you are using virus signature version monitoring with your own staging site for storing the current virus signatures list, you must upload the trusted root certificate of the CA that signed the staging server certificate.

You can install the trusted root CA certificate on the endpoint in any of the following ways:

- Use a CA certificate that is chained to a root certificate that is already installed on the endpoint, such as VeriSign.
- Upload the CA certificate and any intermediate CA certificates to the Ivanti Secure Access client system. During client installation, the system automatically installs the trusted root device CA certificates on the endpoint. When prompted during installation, the user must allow the installation of the CA certificate(s).

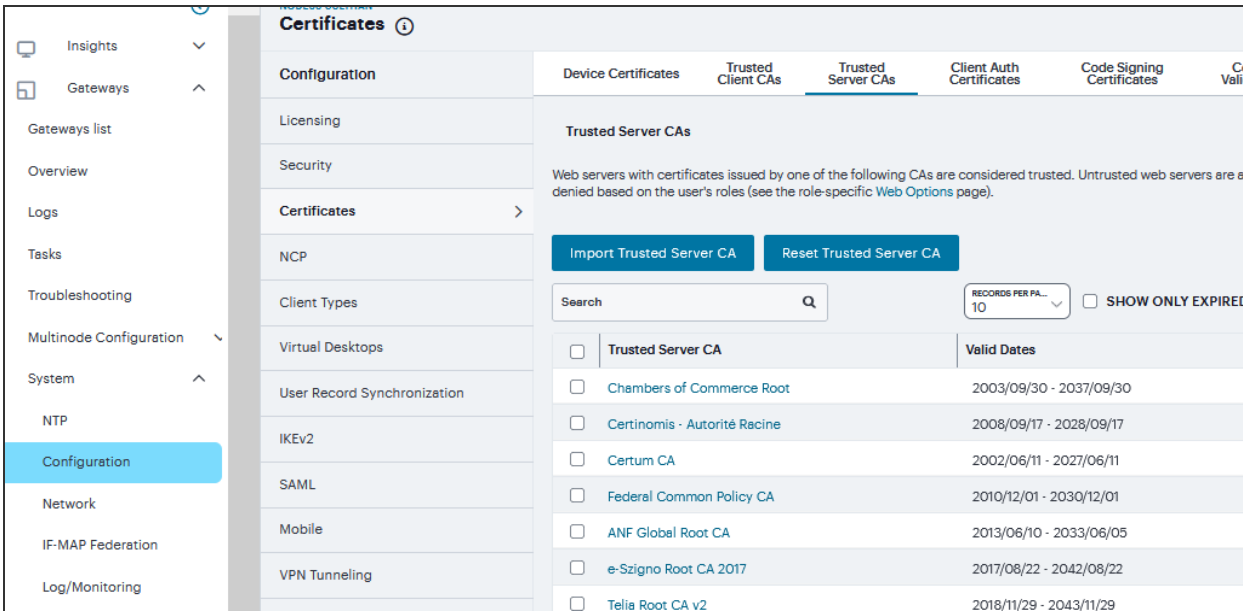

- Prompt users to import the CA certificates on the endpoint using Internet Explorer or other Microsoft Windows tools. In other words, you can use common methods organizations use to distribute root certificates.

To upload CA certificates:

1. Select **System > Configuration > Certificates > Trusted Server CAs** to display the page.
2. Click **Import Trusted Server CA** to display the page.

<input type="checkbox"/>	Trusted Server CA	Valid Dates
<input type="checkbox"/>	Chambers of Commerce Root	2003/09/30 - 2037/09/30
<input type="checkbox"/>	Certinomis - Autorité Racine	2008/09/17 - 2028/09/17
<input type="checkbox"/>	Certum CA	2002/06/11 - 2027/06/11
<input type="checkbox"/>	Federal Common Policy CA	2010/12/01 - 2030/12/01
<input type="checkbox"/>	ANF Global Root CA	2013/06/10 - 2033/06/05
<input type="checkbox"/>	e-Szigno Root CA 2017	2017/08/22 - 2042/08/22
<input type="checkbox"/>	Telia Root CA v2	2018/11/29 - 2043/11/29

3. Browse to the **Certificate File**, select it, and click **Import** to complete the import operation.

To restore the prepopulated group of trusted CA certificates:

1. Select **System > Configuration > Certificates > Trusted Server CAs**.
2. Click **Reset Trusted Server CAs**.
3. Confirm that you want to restore the set of trusted server CAs that was installed when you upgraded.

i Connect Secure restores the group of pre-populated trusted server CAs that were installed upon upgrade. This operation clears all manually imported certificates.

Client Auth Certificates

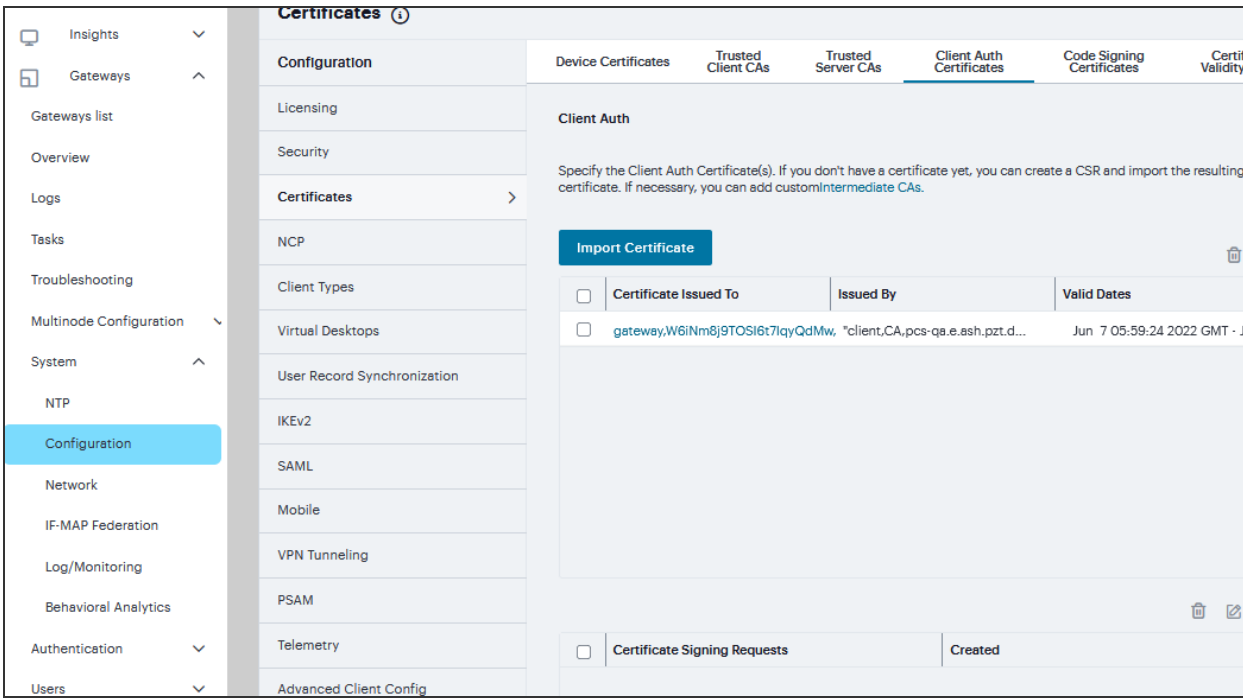

In certain corporate environments, servers on the LAN are protected with two-way SSL authentication. These servers require the client to authenticate by presenting a valid certificate. In the remote access scenario, Ivanti Connect Secure is a client of these servers. You can configure Ivanti Connect Secure to present client authentication certificates to servers whenever it communicates over SSL. Note that Ivanti Connect Secure will present client certificates only when the SSL handshake requires it.

i This feature authenticates Ivanti Connect Secure (as a client) to back-end servers. It also authenticates end users or end-user machines to servers on the corporate LAN.

The access management framework allows certificates that include the private key and for instances where the private key is in a separate file from the certificate. In addition, if your certificates have been exported into a system configuration file, you can import the system configuration file to upload the certificates.

To import the client auth certificates files:

- 1. Select **System > Configuration > Certificates > Client Auth Certificates**.
- 2. Click **Import Certificate** to display the configuration page.

- 3. Complete the configuration described in table.
- 4. Click **Import**.

Import Certificate and Key Settings

Setting	Guidelines
If certificate and private file are separate keys	Browse to the network path or local directory location of your certificate key file.
Certificate File	

Setting	Guidelines
Private Key File	Browse to the network path or local directory location of your private key file.
Password Key	Enter the password key.
Import via System Configuration file	Browse to the network path or local directory location of the system configuration file.
System Configuration File	

To create Certificate Signing Request (CSR) for RSA and ECC Keys:

1. Navigate to **System > Configuration > Certificates > Client Auth Certificates**.
2. Click '+' on the **Certificate Signing Requests** pane.
3. Enter the required requestor information. In this example, the common name is *ecc-p256.<orgname>.net* or *ics.<orgname>.net*.
 - If **RSA** is selected then, select **Key Length** and enter **Random characters**.
 - If **ECC** is selected then, select **ECC Curve** drop down. Click **Save Changes**.
4. The CSR is encoded and can be copied or saved to a file. The ECC certificate should be signed by an RSA/ECC CA for Suite B compliance. Follow your CA's process for sending a CSR.
5. Click the **Back to Device Certificates** link. Until you import the signed certificate from your CA, your CSR is listed as Pending.

New Certificate Signing Request ⓘ

Use this page to create a new Certificate Signing Request (CSR) to send to your Certificate Authority of choice.

KEY TYPE	ECC
COMMON NAME	pca.psecure.net <small>(e.g., secure.company.com)</small>
ORGANIZATION NAME	PulseSecure <small>(e.g., Company Inc.)</small>
ORG. UNIT NAME	?? <small>(e.g., IT Group)</small>
LOCALITY	?? <small>(e.g., SomeCity)</small>
STATE (FULLY SPELLED OUT)	?? <small>(e.g., California)</small>
COUNTRY (2 LETTER CODE)	?? <small>(i.e., US)</small>
EMAIL ADDRESS	??
ECC CURVE	P-256

Code-Signing Certificates

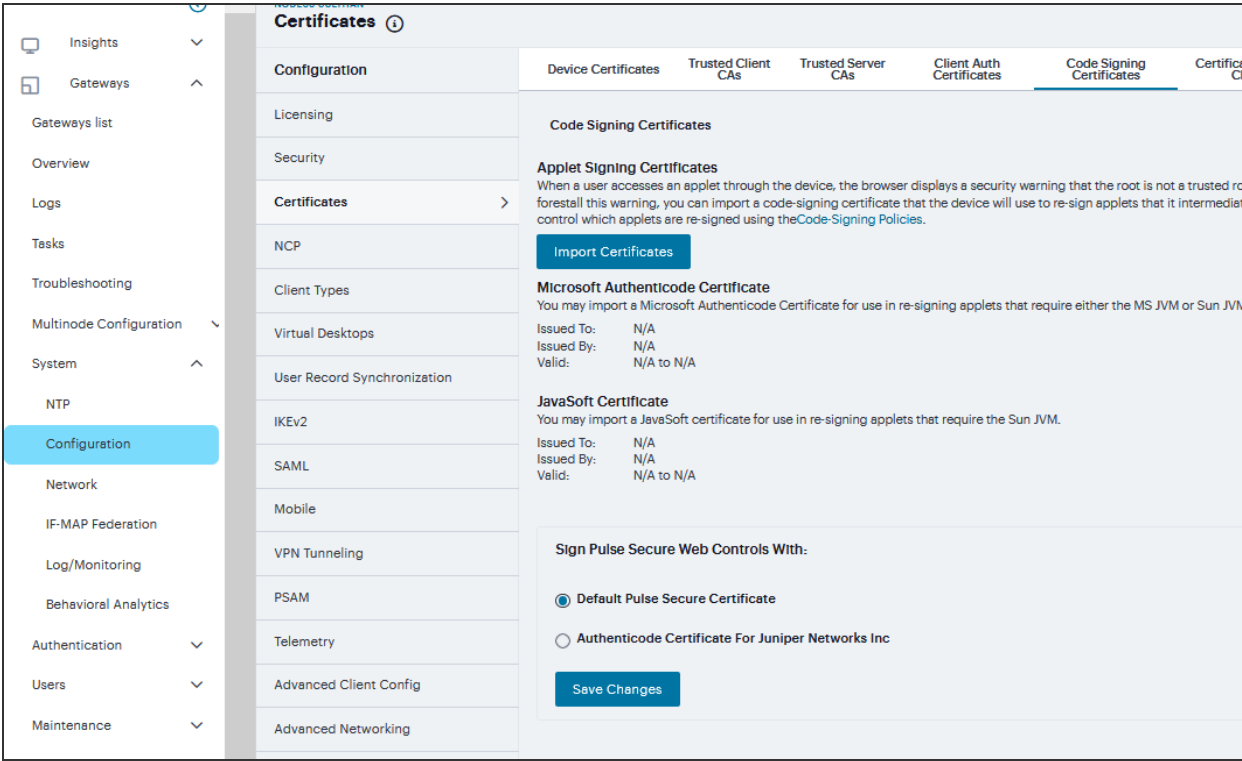

In a basic setup, the only required certificates are a device certificate and a code-signing certificate. Ivanti Connect Secure can use a single code-signing certificate to resign all Java applets and a single device certificate to intermediate all other PKI-based interactions. If the basic certificates do not meet your needs, however, you may install multiple device and applet certificates on Ivanti Connect Secure or use trusted CA certificates to validate users.

When Ivanti Connect Secure intermediates a signed Java applet, it re-signs the applet with a self-signed certificate by default. This certificate is issued by a nonstandard trusted root CA. As a result, if a user requests a potentially high-risk applet (such as an applet that accesses network servers), the user's Web browser alerts him that the root is untrusted.

To import a code-signing certificate:

1. Select **System > Configuration > Certificates > Code-Signing Certificates** to display the configuration page.
2. Click **Import Certificates** to display the configuration page.

3. Complete the configuration described in the following table.

The following table lists the Import Certificates Configuration Guidelines:

Import Certificates Configuration Guidelines

Setting	Guidelines
Microsoft Authenticode or Multipurpose Certificate for Internet Explorer (Microsoft JVM)	
Certificate File	Browse to the network path or local directory location of your certificate key file.
Private Key File	Browse to the network path or local directory location of your private key file.
Password Key	Enter the password key.
JavaSoft Certificate	

Setting	Guidelines
for Internet Explorer & Netscape (Sun JVM)	Browse to the network path or local directory location of the keystore file.
Keystore File	

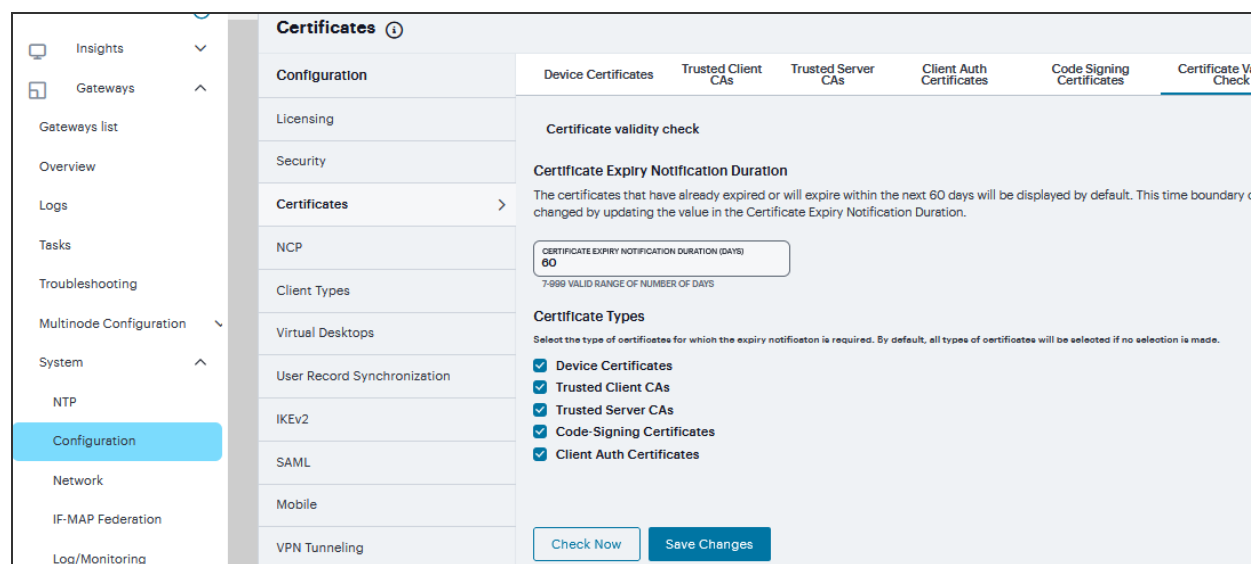

1. Click *Import* to complete the import operation.
2. When you have successfully imported a certificate, the system displays the Sign Ivanti Web Controls With dialog box. Specify the signing option:
 - *Default Ivanti Certificate* - Select this option to sign all ActiveX and Java applets originating from Ivanti Connect Secure using the default Ivanti certificate. If you have previously selected an imported code-signing certificate and are reverting back to this option, after you click Save, a process icon appears indicating that the system is processing the request and re-signing all of the relevant code. This process can take several minutes to complete.
 - *Authenticode Certificate* - For <Imported Certificate Name> -Select this option to sign all ActiveX and Java applets using the certificate or certificates imported in the previous step. When you click Save, a process icon appears indicating that the system is processing the request and signing all of the relevant code. This process can take several minutes to complete.
3. Click **Save Changes**.

Certificate Validity Check

Every time a certificate is added to ICS (through manual import, XML import, or upgrade), its expiration date is stored in the cache. A background process checks all certification expiration dates once in every 7 days. If any certificate is about to expire soon, the administrator is notified. Notifications to administrators include a banner message in the adminUI upon login, SNMP trap, and log messages in the event log. The administrator can configure how soon he or she wishes to be notified of the expiration. The default is 60 days in advance. It can be configured to a value starting from 7 days in advance to 999 days in advance of the expiration of the certificate. The expiration warning window is common to all types of certificates. However, the administrator can choose to enable or disable this feature for each certificate category in the user interface.

To check validity of certificates:

1. Click on **Configuration > Certificates > Certificates Validity Check**.
2. The page displays the **Certificate Expiry Notification Duration** and the **Certificate Types**.
3. Enter the number of days before which the warning must be displayed.
4. Select the type of certificate for which the expiry notification is required. By default, all types of certificates will be selected if no selection is made.
5. Click on Check Now. The Certificate Category, DN name and date of expiry are displayed.
6. When an administrator logs in, a warning sign is displayed, if there are any certificates that expire within the configured number of days.

NCP Configuration

The following types of internal protocols are used to communicate between Ivanti Connect Secure and client applications:

- *Network Communications Protocol (NCP)* - Standard NCP has been replaced with oNCP. Windows client applications, PSAM, and Terminal Services fallback to NCP if oNCP fails.
- *Optimized NCP (oNCP)* - oNCP significantly improves the throughput performance of the client applications over NCP because it contains improvements to protocol efficiency, connection handling, and data compression. Windows client applications, PSAM, and Terminal Services use oNCP by default.

- *Java Communications Protocol (JCP)* -JCP is the Java implementation of standard NCP. The system uses JCP to communicate with Java client applications, JSAM, and the Java Content Intermediation Engine.

To set NCP options:

1. Navigate to **System > Configuration > NCP**.
2. (Windows clients) Under NCP Auto-Select, select:
 - **Auto-select Enabled** (recommended) - Use the oNCP by default. If you select this option, the system uses oNCP for most client/server communications and then switches to standard NCP when necessary. The system reverts to NCP if the user is running an unsupported operating system, browser type, or combination thereof, or if the client application fails to open a direct TCP connection to the device for any reason (for instance, the presence of a proxy, timeout, disconnect).
 - **Auto-select Disabled** - Always use standard NCP. This option is primarily provided for backwards compatibility.

NCP ⓘ

Configuration

Client-server applications use the Network Communication Protocol (NCP) for connections between the client and the PCS gateway.

NCP Auto-Select
Enabling Auto-Select will use oNCP (optimized NCP) by default and will revert to NCP if a direct connection is not possible (e.g. in proxy environment).

☒ **Auto-select Enabled**
This option is suitable for most applications. The protocol automatically selects the most efficient mode of operation.

☐ **Auto-select Disabled**
This option is no longer supported. This option is provided for compatibility and should not ordinarily be selected.

READ CONNECTION TIMEOUT ⓘ
90

IDLE CONNECTION TIMEOUT ⓘ
120

SAM Idle Timer Option
Enable this option to restart idle timer on receiving DNS/NetBIOS requests.

☒ **Enabled**
Restart idle timer on receiving DNS/NetBIOS requests.

☐ **Disabled**
Do not restart idle timer on receiving DNS/NetBIOS requests.

Note that changing any of the above settings might restart some services in the PCS gateway.

Save Changes

If you are using Network Connect to provide client access, we recommend that you exercise caution when employing the Auto-select Disabled option, as Mac and Linux clients cannot connect using the traditional NCP protocol. If you disable the oNCP/NCP auto-selection feature and a UDP-to oNCP/NCP fail-over occurs, the system disconnects Macintosh and Linux clients because it fails over from UDP to NCP (instead of oNCP), which does not support these users.

3. (Java clients) Under **Read Connection Timeout**, set the timeout interval for Java clients (15-120 seconds). If client-side secure access methods do not receive data from the system for the specified interval, they try to reestablish a connection. Note that this value does not apply to user inactivity in client applications.
4. (Windows clients) Under Idle Connection Timeout, set the idle connection interval. This timeout interval determines how long the system maintains idle connections for client-side Windows secure access methods.
5. Under **SAM Idle Timer** enable/disable idle timer to receive DNS/NetBIOS requests
6. Click **Save Changes**.

Client Types Configuration

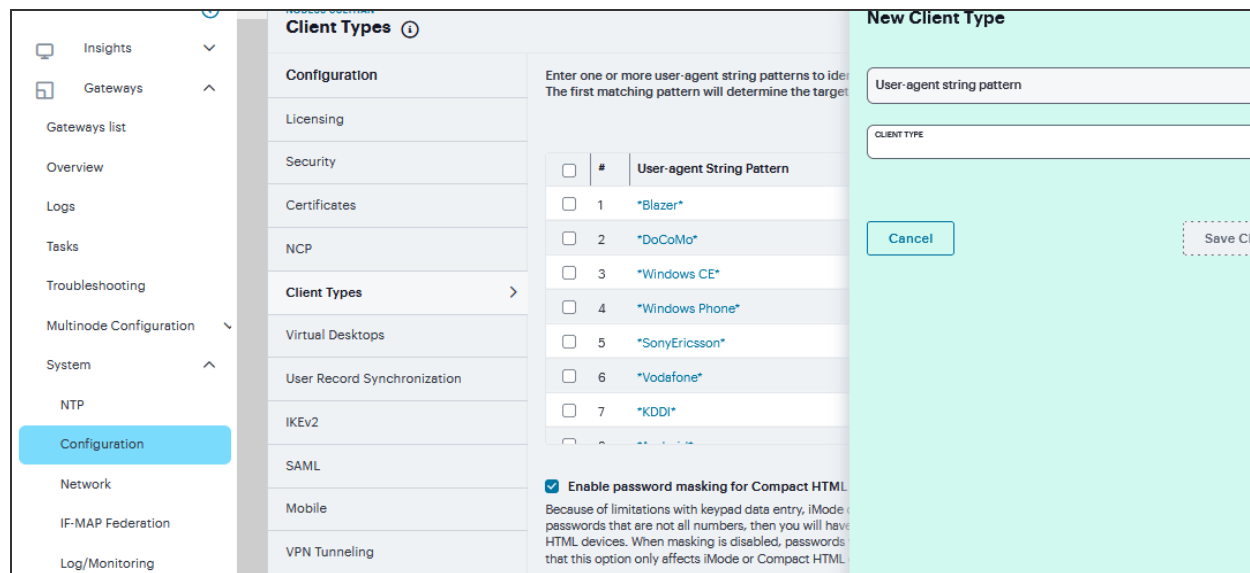

The Client Types tab allows you to specify the types of systems your users may sign in from and the type of HTML pages to display when they do. In addition, client types are used to identify the operating system shown on the Device Management page for devices that use ActiveSync to synchronize e-mail with a Microsoft Exchange server. The user agent string used to identify a device during login may be different from the one in the ActiveSync message. For example, in the list of default user agent strings, *Apple-iPhone* and *Apple-iPad* are used only in ActiveSync messages.

To manage the client types:

1. Navigate to **System > Configuration > Client Types**.
2. In the User-agent string pattern text box, enter the user agent string for the operating system (s) that you want to support. You can specify all or part of the string. For example, you can use the default *DoCoMo* string to apply to all DoCoMo operating systems, or you can create a string such as *DoCoMo/1.0/P502i/c10* to apply to a single type of DoCoMo operating system. You can use the * and ? wildcard characters in the string. Note that user agent strings on the system are case-insensitive.

3. Select the type of HTML to display to users who sign in from the operating system specified in the previous step. Options include:

- *Standard HTML* - The system displays all standard HTML functions, including tables, full-size graphics, ActiveX components, JavaScript, Java, frames, and cookies. Ideal for standard browsers, such as Firefox, Mozilla, and Internet Explorer.
- *Compact HTML (iMode)* - The system displays small-screen HTML-compatible pages. This mode does not support cookies or the rendering of tables, graphics, ActiveX components, JavaScript, Java, VB script, or frames. (The only difference between this option and the Smart Phone HTML Basic option is the user interface.) Ideal for iMode browsers.

Form Post SSO is not supported on iMode appliances.

- *Mobile HTML (Pocket PC)* - The system displays small-screen HTML-compatible pages that may contain tables, small graphics, JavaScript, frames, and cookies, but this mode does not facilitate the rendering of java applets or ActiveX components. Ideal for Pocket PC browsers.
- *Smart Phone HTML Advanced* - The system displays small-screen HTML-compatible pages that may contain tables, small graphics, frames, cookies, and some JavaScript, but this mode does not facilitate the rendering of java applets, ActiveX components, or VB scripts. Ideal for Treo and Blazer browsers.

- *Smart Phone HTML Basic* - The system displays small-screen HTML-compatible pages. This mode does not support cookies or the rendering of tables, graphics, ActiveX components, JavaScript, Java, VB script, or frames. (The only difference between this option and the Compact HTML option is the user interface.) Ideal for Opera browsers on Symbian.

The system rewrites hyperlinks to include the session ID in the URL instead of using cookies.

- *Mobile Safari, Android, Symbian, iPad* - The Mobile Safari (iPhone/iPod Touch), Android, and Symbian selections have Basic, Advanced, and Full HTML options.
4. Specify the order that you want to evaluate the user agents. The system applies the first rule in the list that matches the user's system. For example, you may create the following user agent string/HTML type mappings in the following order
 - User Agent String: *DoCoMo* Maps to: Compact HTML
 - User Agent String: *DoCoMo/1.0/P502i/c10* Maps to: Mobile HTML

If a user signs in from the operating system specified in the second line, the system will display compact HTML pages to him, not the more robust mobile HTML, since his user agent string matches the first item in the list. To order mappings in the list, select the check box next to an item and then use the up and down arrows to move it to the correct place in the list.

5. Select the **Enable password masking for Compact HTML** check box if you want to mask passwords entered in iMode and other devices that use compact HTML. (Devices that do not use compact HTML mask passwords regardless of whether or not you select this check box.) Note that if your iMode users' passwords contain non-numeric characters, you must disable password masking because iMode devices only allow numeric data in standard password fields. If you disable masking, passwords are still transmitted securely, but are not concealed on the user's display.
6. Click **Save Changes**.

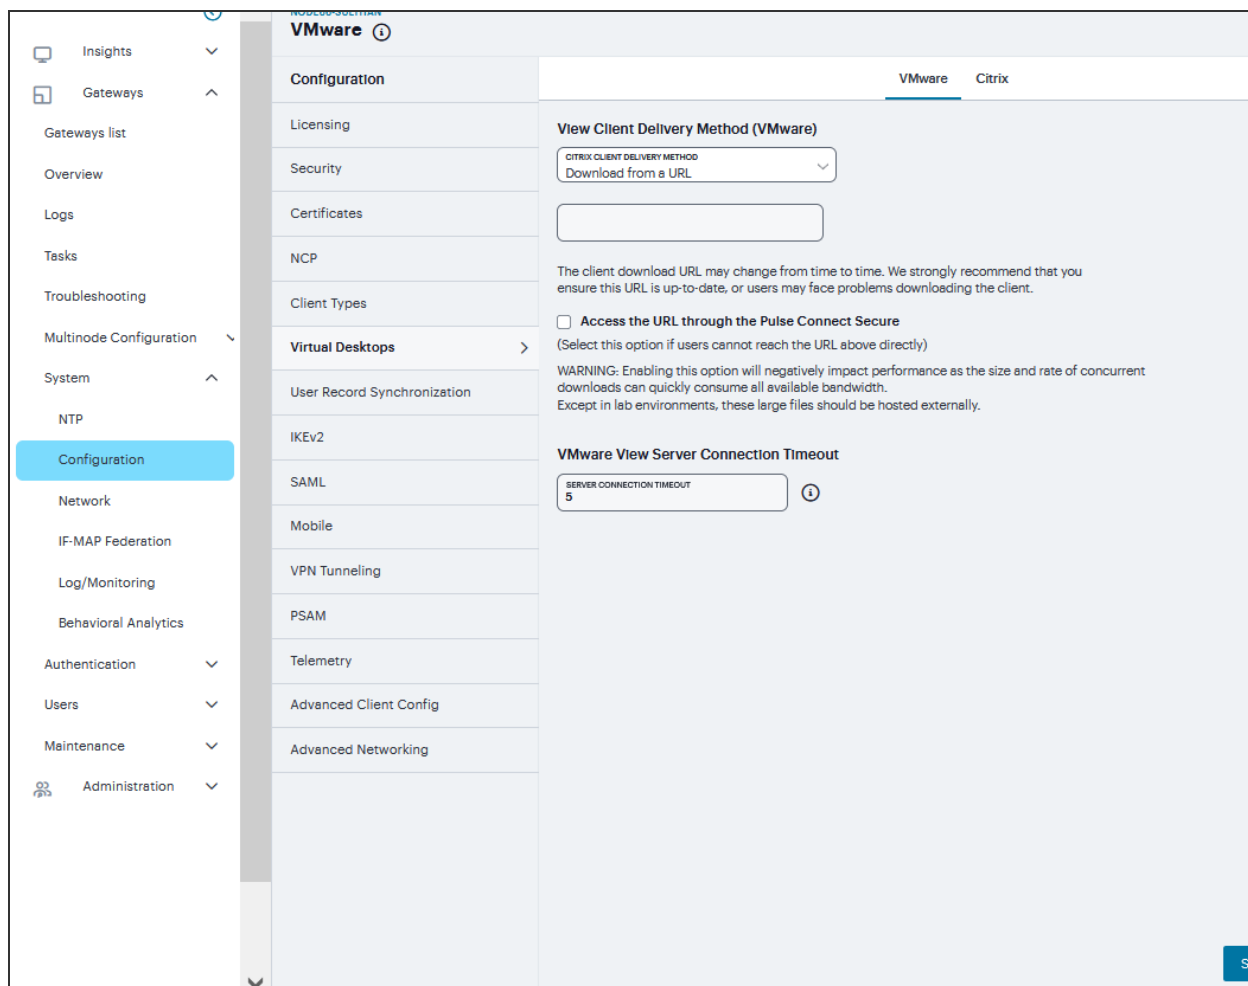

Virtual Desktops Configuration

In addition to standard resource profiles and resource profile templates, you can configure virtual desktops as resource profiles. As with the other resource profiles, a virtual desktop profile contains all of the role assignments and end-user bookmarks required to provide access to an individual resource. Unlike other resource profile types, there is no resource policy to configure for virtual desktops due to the dynamic nature of virtual desktops. The IP address and port of the system is not known until the end user launches a session so dynamic ACLs are used.

You can use the Virtual Desktop Configuration page to define the client delivery mechanism for end-users who do not have the client. The process is similar for both Citrix XenDesktop and VMware View Manager.

1. Navigate to **System > Configuration > Virtual Desktops**.
 - For **View Client Delivery Method** Select **VMware**.
 - For **Citrix XenDesktop**, select **Citrix**.
2. Select **Download from Ivanti Connect Secure** to download the client file from the system. Click **File** to locate the client file (*.msi*, *.exe* or *.cab*) and enter the **version number**.

3. Select **Download from a URL** to download the client file from the Internet. If desired, enter a new URL to override the default.

4. Check the **Access the URL through the Ivanti Connect Secure** check box if end users cannot directly access the specified Web page. Selecting this option allows users to use the secure gateway to access the URL.
5. Under **Server Connection Timeout**, enter the number of seconds to wait for the server to respond before timing out.

User Record Synchronization

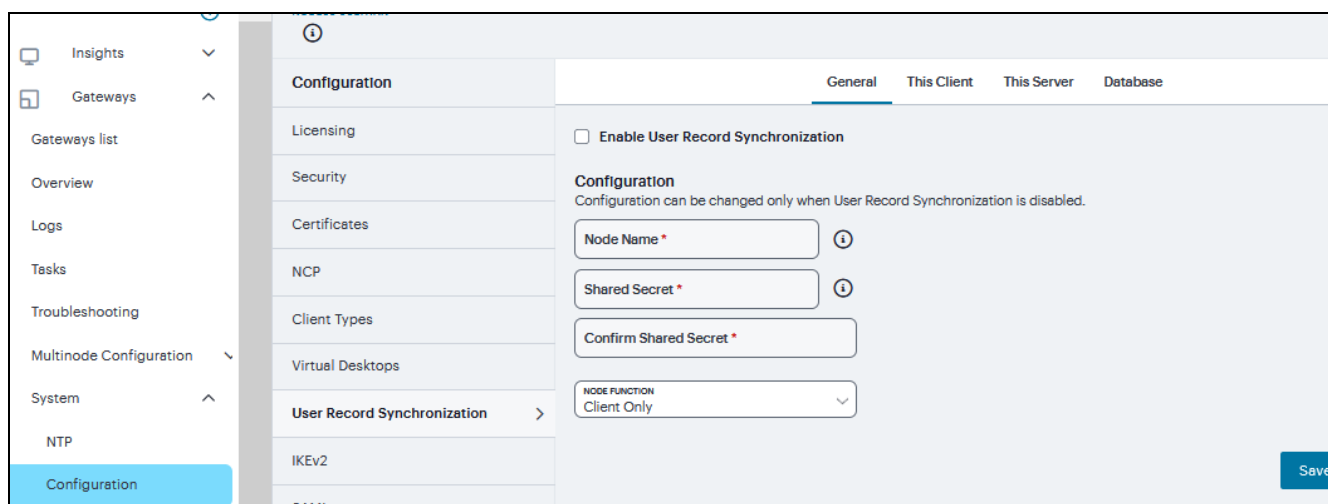

The user record synchronization feature promotes a more consistent user experience by allowing users to retain their bookmarks and individual preferences regardless of which device they log in to.

User record synchronization relies on client-server pairings. The client is the device that users log in to start their remote access. Each client is associated with one primary server and one backup server to store user record data. Clients can be individual appliances or a node within a cluster.

A server in this instance is the device that stores the user data records. Each server can be configured to replicate its user record data to one or more peer servers. Servers are identified by a user-defined logical name. The same logical name can be assigned to more than one authentication server to let you associate authentication servers of different types to the same user. For example, SA1 is an ACE authentication server with user1 who creates a bookmark to www.<orgname>.net. SA2 is an Active Directory authentication server with the same user1. For the www.<orgname>.net bookmark to be transferred from SA1/ACE/user1 to SA2/AD/user1 you would assign the logical name "Logical1" to both the ACE server on SA1 and the Active Directory server on SA2.

General Setup

1. Navigate to **System > Configuration > User Record Synchronization > General**.
2. Select the **Enable User Record Synchronization** check box.
3. Enter a unique **node name**. This name is used when associating a client with a server and is different from the logical name assigned to a server. This node name is also not the same as the cluster node name.
4. Enter the **shared secret** and **confirm it**. The shared secret is the password used to authenticate the client with its servers and the primary server with its peer servers. Use the same shared secret for all clients and servers participating in user record synchronization.
5. Select whether this node is **client only** or if this node acts as both a **client and server**.
6. Click **Save Changes**.

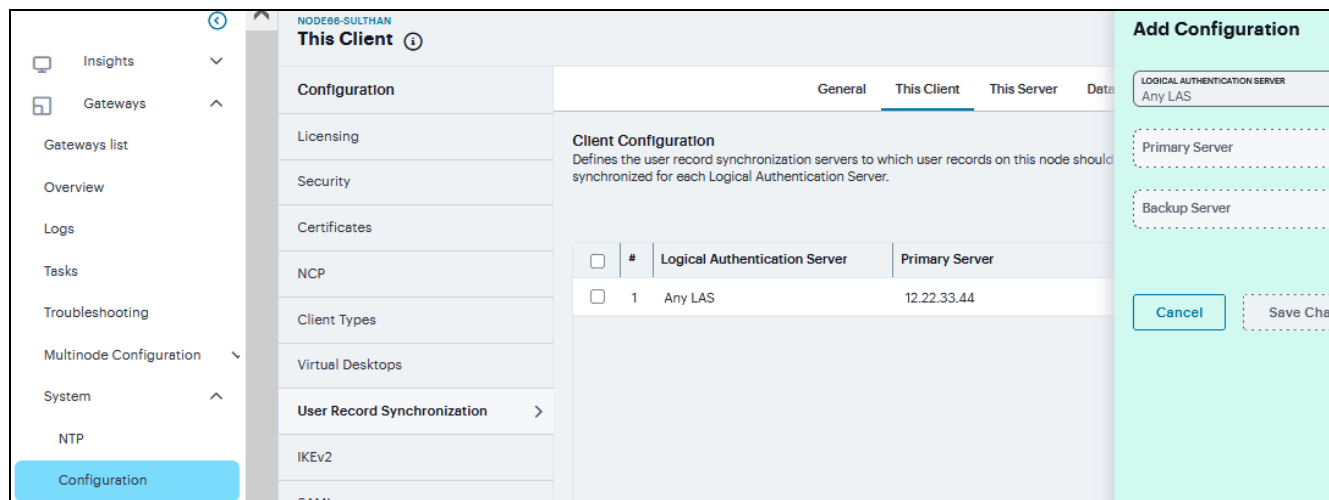

- If you need to make any changes in this window at a later time, you must deselect the Enable User Record Synchronization check box and click Save Changes. Make your edits, select the Enable User Record Synchronization check box and save your changes.
- Once you enter a name and shared secret, you cannot clear these fields.

Client Configuration

To set up the client, you select the primary and backup server you want this client to synchronize with:

1. Navigate to **System > Configuration > User Record Synchronization > This Client**.
2. Click '+', Select the LAS name you want to synchronize and enter the primary IP of the user record. If you prefer to synchronize with any available server, select *Any LAS*.
3. Enter the **Primary** and optionally a **Backup server's** IP address and then click **Save Changes**.

Even if you select Any LAS, you must enter a primary server IP address. Once added, the primary and backup servers have a colored icon next to their name indicating their connection status.

Server Configuration

To set up the user record synchronization server you must define its peer nodes (optional) and the clients that can access this server.

1. Navigate to **System > Configuration > User Record Synchronization > This Server**.
 2. Under **Peer Server**, click '+' and enter the peer server's **Node name** and **IP address**, then click **Save Changes**. To specify more than one peer server, enter each server's node name and IP address individually and click **Save Changes**. There is no limit on the number of peer servers you can add.
- Data is replicated from the primary or backup server to its peer servers. If the primary is not available, user data is sent to the backup. User data is then replicated to the peer servers.
3. For each client you want synchronized with this server, Under **Client Nodes**, click '+' enter the **Client's name** and **IP address** and click **Save Changes**.

Once added, peer servers will have a colored icon next to their name indicating their connection status. Node status is provided to client nodes and LAS mapping servers as well.

The screenshot displays the 'This Server' configuration page. The left sidebar contains a navigation menu with categories like Insights, Gateways, System, and Configuration. The 'Configuration' category is expanded, showing various settings such as Licensing, Security, Certificates, NCP, Client Types, Virtual Desktops, User Record Synchronization, IKEv2, SAML, Mobile, VPN Tunneling, PSAM, Telemetry, Advanced Client Config, and Advanced Networking. The 'User Record Synchronization' section is selected, showing a sub-tab for 'This Server'. This sub-tab has three tabs: 'General', 'This Client', and 'This Server' (which is active). Below these tabs, there are two main sections: 'Peer Servers' and 'Client Nodes'. The 'Peer Servers' section includes a description: 'Changes to user records received by this server will be copied to the peer servers configured here.' It features a table with columns for a checkbox, an ID number, 'Server Node Name', and 'Internal Address'. The 'Client Nodes' section includes a description: 'Configure all the client nodes which are allowed to access this server.' It also features a table with columns for a checkbox, an ID number, 'Client Node Name', and 'Internal Address'. Both tables are currently empty, and a 'No Data Available' message is shown in the center of the Peer Servers section.

Database Configuration

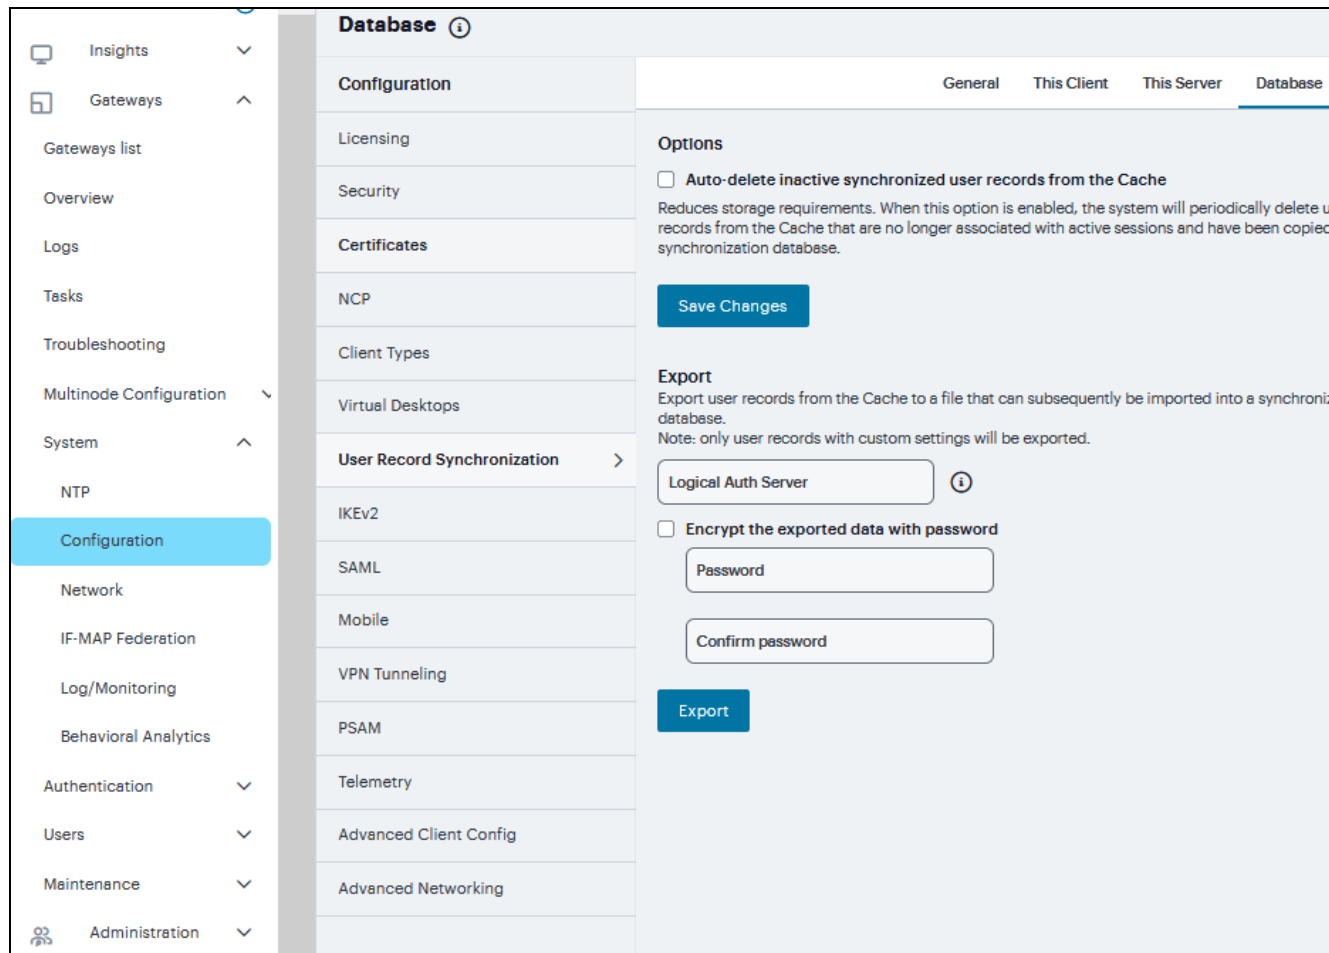

With the Database tab, you can delete inactive records from the client cache, retrieve statistics about the database, export and import the data and remove user data from the server's database.

To configure the database:

1. Navigate to **System > Configuration > User Record Synchronization > Database**.
2. Select **Auto-delete inactive synchronized user records from the Cache** to remove inactive user records from the cache and not from the user record database.

When this option is selected, the system performs a check every 15 minutes and deletes user records that meet all of the following criteria:

- There are no active user sessions associated with the user record.
 - The user record does not have any custom settings, or the latest version of the user record has been synchronized with the user record database.
 - The authentication server associated with the user record database does not have type "local". For example, the "System Local" auth server that is part of the default configuration of the system has a "local" type, so any user records associated with that auth server will not be auto-deleted. However, user records associated with external authentication servers like Radius or LDAP may be deleted, depending on the two prior criteria.
3. Click **Save Changes**.
 4. Under **Export**, you export user records to a file. The user records can be exported from the user record database, or from the cache. The exported file can be used to pre-populate the user record database on another node.
 5. To encrypt the exported data, select the **Encrypt the exported data with password** check box and enter the **Password** and **Confirm it**.
 6. Click **Export** to export the user records from the specified source (cache or database). You will be prompted where to save the file.

IKEv2 Configuration

IKE or IKEv2 (Internet Key Exchange) is the protocol used to set up a security association in the IPsec protocol suite. Microsoft Windows 7 fully supports the IKEv2 standard through Microsoft's Agile VPN functionality and can operate with a VPN gateway using these protocols. Information on IKE and IKEv2 is widely available on the Internet. It is not the intent of this guide to describe details about IKE and IKEv2.

The system supports IKEv2, enabling interoperability with clients or devices, such as smartphones, that have a standards-based IPsec VPN client. IKEv2 clients count toward the total number of sessions. Thus, the total number of sessions = number of IKEv2 sessions + number of NCP sessions. The system supports the following methods for authenticating IKEv2 clients:

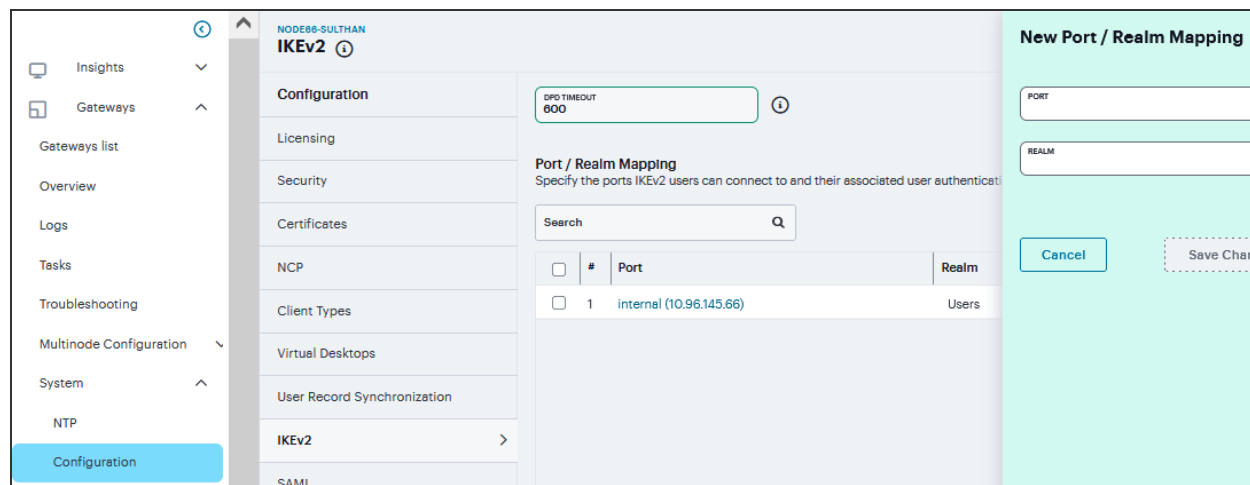

- Machine certificate-based authentication
- Authentication using EAP methods

i IKEv2 uses port 500 exclusively. Do not configure port 500 in your VPN Tunneling profiles.

To configure the IKEv2 ports and EAP protocol:

1. Navigate to **System > Configuration > IKEv2** to display the configuration page.
2. Enter the **DPD timeout** value in seconds. Valid values are 400-3600.

DPD is a form of keepalive. When a tunnel is established but idle, one or both sides may send a "hello" message and the other replies with an acknowledgement. If no response is received, this continues until the DPD time value has elapsed. If there still is no traffic or acknowledgement, the peer is determined to be dead and the tunnel is closed.

3. Under **Port/Realm Mapping**, click '+' select the **Port** and the **Realm** to use that port and click **Save Changes**.

- Under **Realm/Protocol Set Mapping**, click '+' select the **Realm** and the **EAP protocol set** to use for that realm.

The three Protocol Set Options include EAP-MSCHAP-V2, EAP-MD5-Challenge, and EAP-TLS.

The screenshot displays the System Configuration interface. On the left is a navigation menu with categories like Insights, Gateways, Logs, Tasks, Troubleshooting, Multinode Configuration, System, and Administration. The 'Configuration' section is highlighted. The main content area is titled 'User Record Synchronization' and lists various protocols: IKEv2, SAML, Mobile, VPN Tunneling, PSAM, Telemetry, Advanced Client Config, and Advanced Networking. The 'IKEv2' protocol is selected. On the right, a 'New Realm / Protocol Set Mapping' dialog is open. It has input fields for 'REALM' and 'PROTOCOL SET'. Below these is a table with columns for '#', 'Realm', and 'Protocol Set'. The table is currently empty, showing 'No Data Available'. Below the table, there are 'Phase 1 key settings' and 'Initial Contact' sections. The 'Initial Contact' section has a checkbox labeled 'Enable PCS to process INITIAL_CONTACT request' which is checked.

Realm / Protocol Set Mapping
Specify the EAP protocol sets that are to be supported by the user realms.
Note that user realms using certificate authentication for IKEv2 users do not need to be assigned a protocol set.

Search

#	Realm	Protocol Set
No Data Available		

Phase 1 key settings
IKEv2 Phase 1 key settings below will override current key settings. Changing these settings will require a restart of the IKEv2 service.

- ☐ Allow only AES256 for Phase 1 key negotiation
- ☐ Allow only SHA2 for Phase 1 key negotiation
- ☐ Allow only DH 2048 bit or DH 3072 bit for Phase 1 key negotiation

Initial Contact
Enabling Initial Contact will delete all existing sessions for that user if request contains INITIAL_CONTACT session is enabled

- ☒ Enable PCS to process INITIAL_CONTACT request

5. To Configure Phase-1 Key Settings, select the required Phase 1 Key Settings.

Three new UI options are available to enforce:

- Encryption Algorithm (AES256)
- Integrity Algorithm (SHA256, SHA384 and SHA512)
- Diffie-Hellman Group (DH 2048 and DH3072).

Enabling these options mean more secured Phase 2 negotiations. When AES256 is enabled, AES256 Encryption Algorithm is preferred over AES128 or 3DES. When SHA2 is Enabled, SHA2 Integrity Algorithm is preferred over SHA1 and When DH is Enabled, DH2048 or DH3072 Diffie-Hellman Group is preferred over DH1024.

6. Click **Save Changes**.

Changing IKEv2 configuration (System > Configuration > IKEv2) disconnects connections from IKEv2 clients, VPN Tunneling and Ivanti. VPN Tunneling and Ivanti will reconnect automatically.

SAML Configuration

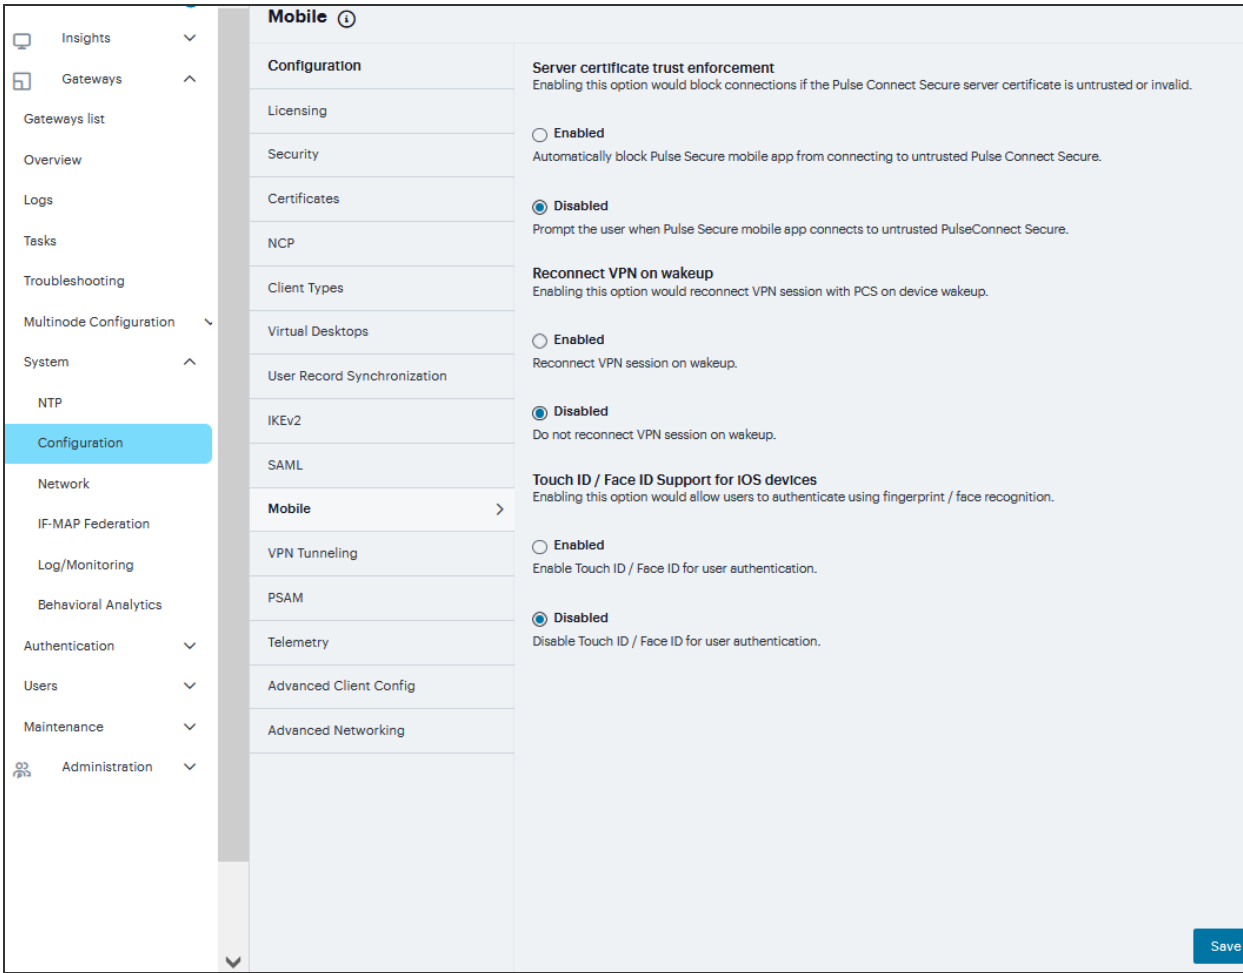

SAML is an XML-based framework for communicating user authentication, entitlement, and attribute information. The standard defines the XML-based assertions, protocols, bindings, and profiles used in communication between SAML entities. SAML is used primarily to implement Web browser single sign-on (SSO). SAML enables businesses to leverage an identity-based security system like Ivanti Connect Secure to enforce secure access to web sites and other resources without prompting the user with more than one authentication challenge.

You use the System > Configuration > SAML pages to maintain a table of SAML metadata files for the SAML service providers and identity providers in your network. Using SAML metadata files makes configuration easier and less prone to error. You can add the metadata files to the system by:

- Uploading a metadata file.
- Retrieving the metadata file from a well-known URL.

To add metadata files:

1. Navigate to **System > Configuration > SAML**.
2. Click '+' to display the configuration page.

3. Enter **New Metadata Provider** name.
4. Complete the settings described in the following table
5. Click **Save Changes**

SAML Metadata Provider Configuration Guidelines

Setting	Guidelines
Metadata Provider Location Configuration	Select one of the following methods: <ul style="list-style-type: none">• Local Browse and locate the metadata file on your local host or file system.

Mobile Configuration

This topic describes the mobile options that are available on Ivanti Connect Secure. To configure the mobile option, go to **System > Configuration > Mobile**. It includes the following information:

Mobile ⓘ	
Configuration	Server certificate trust enforcement Enabling this option would block connections if the Ivanti Connect Secure server certificate is untrusted or invalid.
Licensing	<input checked="" type="radio"/> Enabled Automatically block Ivanti Secure Access mobile app from connecting to untrusted Pulse Connect Secure.
Security	<input type="radio"/> Disabled Prompt the user when Ivanti Secure Access mobile app connects to untrusted PulseConnect Secure.
Certificates	
NCP	
Client Types	Reconnect VPN on wakeup Enabling this option would reconnect VPN session with PCS on device wakeup.
Virtual Desktops	<input type="radio"/> Enabled Reconnect VPN session on wakeup.
User Record Synchronization	<input checked="" type="radio"/> Disabled Do not reconnect VPN session on wakeup.
IKEv2	
SAML	Touch ID / Face ID Support for iOS devices Enabling this option would allow users to authenticate using fingerprint / face recognition.
Mobile >	<input type="radio"/> Enabled Enable Touch ID / Face ID for user authentication.
VPN Tunneling	<input checked="" type="radio"/> Disabled Disable Touch ID / Face ID for user authentication.
PSAM	
Telemetry	
Advanced Client Config	Client UI Mode for Mobile Users Option to choose between Classic and NeUX for mobile end users.
Advanced Networking	<input checked="" type="radio"/> NeUX <input type="radio"/> Classic
	Communication protocol preference for mobile ISAC <input checked="" type="radio"/> IFT/TLS <input type="radio"/> NCP
	Enable play integrity check for rooting detection on Android devices Enabling this option would allow Android devices to perform play integrity check
	<input checked="" type="radio"/> Enabled <div style="border: 1px solid #ccc; padding: 2px; margin-bottom: 5px;"> * Project Number <small>Google Cloud account's Project Number</small> </div> <div style="border: 1px solid #ccc; padding: 2px; margin-bottom: 5px;"> * KEY FILENAME No file chosen </div> <small>Upload JSON key file downloaded from Google Cloud service account</small>
	<input type="radio"/> Disabled

The following table lists the Configuring the Mobile Options:

Option	Description
Server certificate trust enforcement	Enables you to block connections if the Ivanti Connect Secure server certificate is untrusted or invalid. When enabled, it automatically blocks the Ivanti Secure Access Client app from connecting to untrusted Ivanti Connect Secure. When disabled, it prompts when Ivanti Secure Access Client app connects to untrusted Ivanti Connect Secure.
Reconnect VPN on wakeup	Enables you to reconnect a VPN session with ICS on device wakeup.
Touch ID / Face ID Support for iOS devices	Enables you to authenticate using fingerprint / face recognition.
Client UI Mode for Mobile Users	Enables you to switch between Classic and NeUX
Communication protocol preference for mobile ISAC	Enables you to choose the type of authentication to use either IF-T/TLS or NCP.
Enable play integrity check for rooting detection on Android devices	<p>Enabling this option would allow Android devices to perform play integrity check.</p> <p>It helps to check if interactions and server requests are coming from the genuine app binary running on a genuine Android device.</p> <p>To Enable the play integrity check perform the following:</p> <ol style="list-style-type: none"> 1. Enter the Google Cloud account's Project Number. Only Numeric characters are allowed. 2. Browser to upload JSON key file downloaded from Google Cloud service account. <hr/> <p> Correct system time should be used on ICS and ICS system should have internet connectivity to reach to Google Cloud server.</p> <hr/> <p> DNS Server should resolve the host name of https://www.googleapis.com</p> <hr/> <p>For more info refer to Overview of the Play Integrity API.</p>

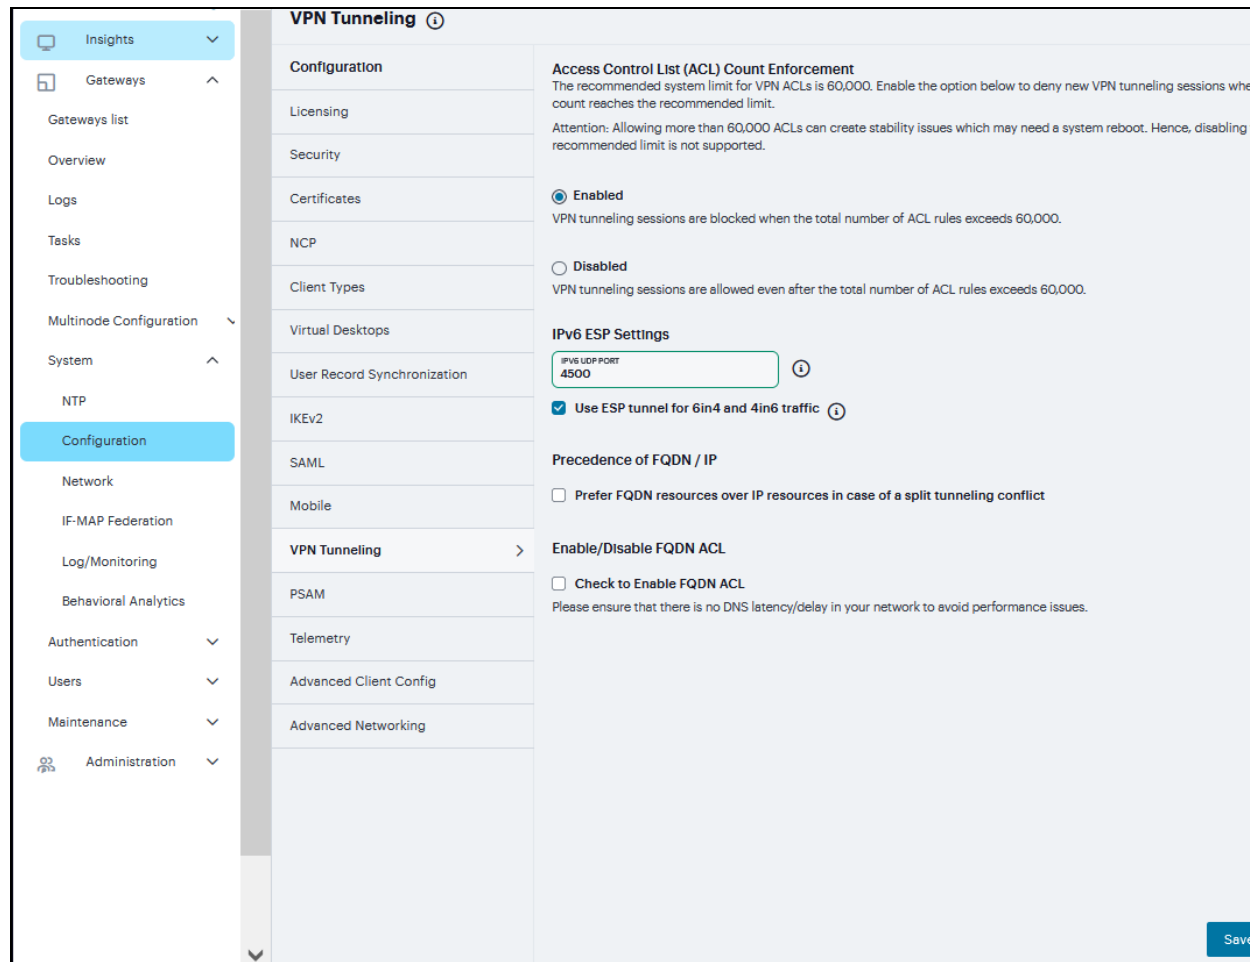

VPN Tunneling Configuration

The VPN tunneling access option (formerly called Network Connect) provides a VPN user experience, serving as an additional remote access mechanism to corporate resources using Connect Secure. This feature supports all Internet-access modes, including dial-up, broadband, and LAN scenarios, from their client machine and works through client-side proxies and firewalls that allow SSL traffic.

When a user launches VPN tunneling, the system transmits all traffic to and from the client over the secure VPN tunnel. The only exception is for traffic initiated by other system-enabled features, such as Web browsing, file browsing. If you do not want to enable other system features for certain users, create a user role for which only the VPN tunneling option is enabled and make sure that users mapped to this role are not also mapped to other roles that enable other system features.

To configure VPN tunneling:

1. Navigate to **System > Configuration > VPN Tunneling**.
2. Under **Access Control List (ACL) Count Enforcement** enable to block VPN tunneling sessions when the total number of ACL rules exceeds 60,000.
3. Under **IPv6 ESP Settings**, enter **UDP Port number** and select the **Use ESP tunnel for 6in4 and 4in6** traffic check box.
4. Under **Precedence of FQDN / IP** section, check **Prefer FQDN resources over IP resources in case of a split tunneling conflict**.
5. Under **Enable/Disable FQDN ACL**, check to Enable FQDN ACL
6. Click **Save Changes**.

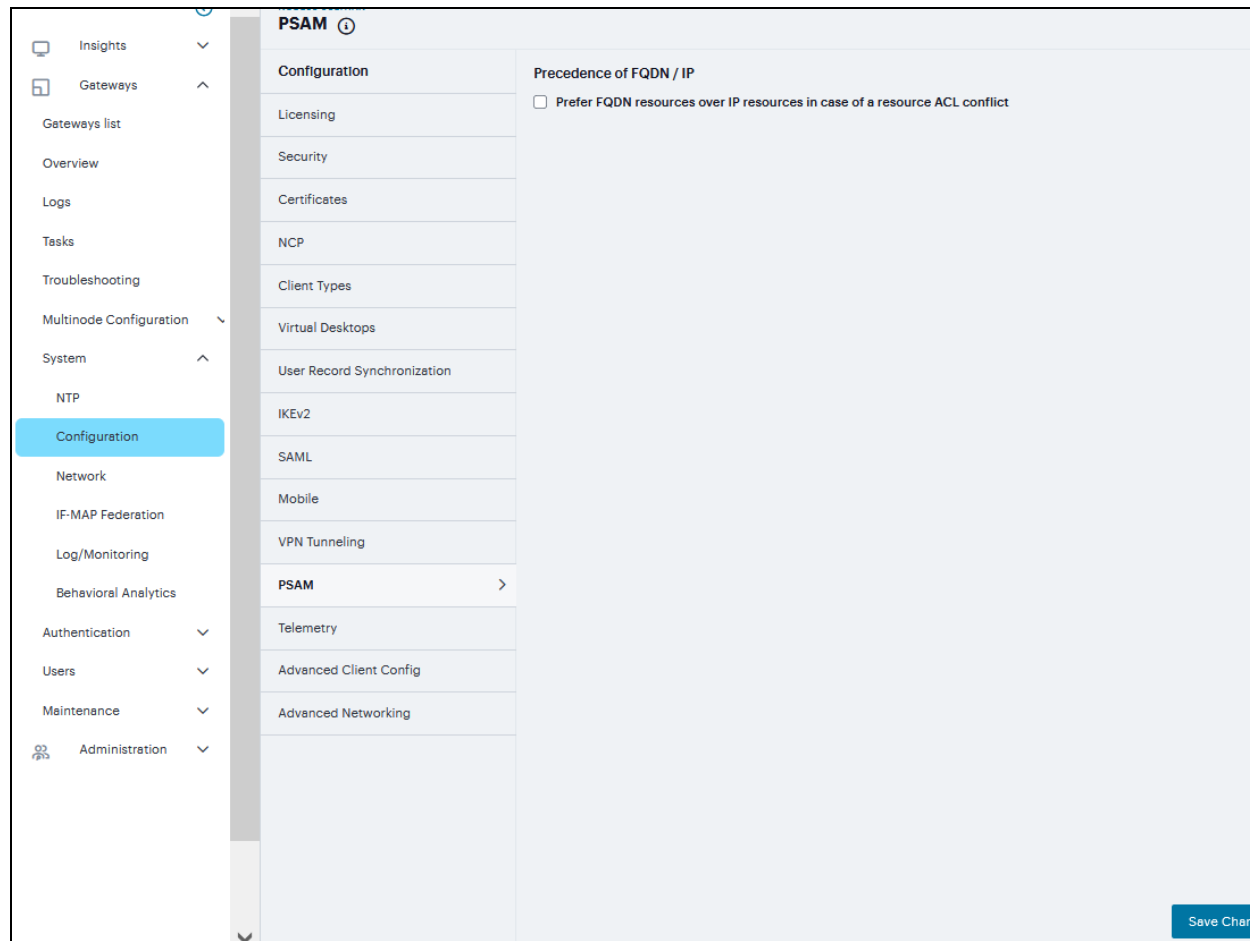

PSAM Configuration

The Secure Application Manager option provides secure, application-level remote access to enterprise servers from client applications. The Windows version of the Secure Application Manager is a Windows-based solution that enables you to secure traffic to individual client/server applications and application servers.

To Configure PSAM:

1. Navigate to **System > Configuration > PSAM**
2. Under **Precedence of FQDN / IP section**, check Prefer FQDN resources over IP resources in case of a resource ACL conflict.

Telemetry Settings

Telemetry Settings helps you to enable Google Analytics and Crash Analytics.

To monitor the usage of customer and track the crash #. Navigate to **System > Configuration > Telemetry**

- Enable **Google Analytics** to tracking how frequently customer is using a particular feature.
- Enable **Crash Analytics** to collect logs when user faces any crash.

Advanced Client Configuration

This topic describes the XML advanced client configuration that can be used by the ICS administrator to configure the custom settings, which are meant to solve a specific customer scenario without changing the ICS admin console. Admin can set these custom settings in the form of XML input through the Advanced Client Configuration UI feature. Ivanti Secure Access clients supporting these custom settings will consume them when connecting to this ICS, and the same would be applied on the client machines. This feature will minimize the number of changes going into the ICS admin console, in order to fulfill a custom requirement of a specific customer.

If the administrator configures the Ivanti Connect Secure sever with the following XML input in "Advanced Client Configuration for Ivanti Secure Access Client" option, it will ignore TCP MSS options while calculating the virtual adapter MTU on client side.

To add advance client config:

1. Navigate to **System > Configuration > Advanced Client Configuration** to display the configuration page.
2. Enter the following XML input in **Advanced Configuration for Ivanti Secure Access Clients**.

```
<advanced-config>
  <version> version </version>
  <desktop-client-config>
    <layer3-connection-config>
      <adapter-config>
        <ignore-tcp-mss>TRUE</ignore-tcp-mss>
      </adapter-config>
    </layer3-connection-config>
  </desktop-client-config>
</advanced-config>
```

3. Click **Save Changes**.

The advanced configuration setting "ignore-tcp-mss" is Layer3 Adapter configuration setting and this will be consumed by the Ivanti Secure Access client as part of the IpsecConfig.

This "ignore-tcp-mss" setting is applicable for the virtual adapter MTU calculation only for IPv4. By default, the setting is always false, and therefore the TCP MSS options are always considered for MTU by default. Admin has to explicitly set the ignore-tcp-mss setting to TRUE (case insensitive), to ignore TCP MSS.

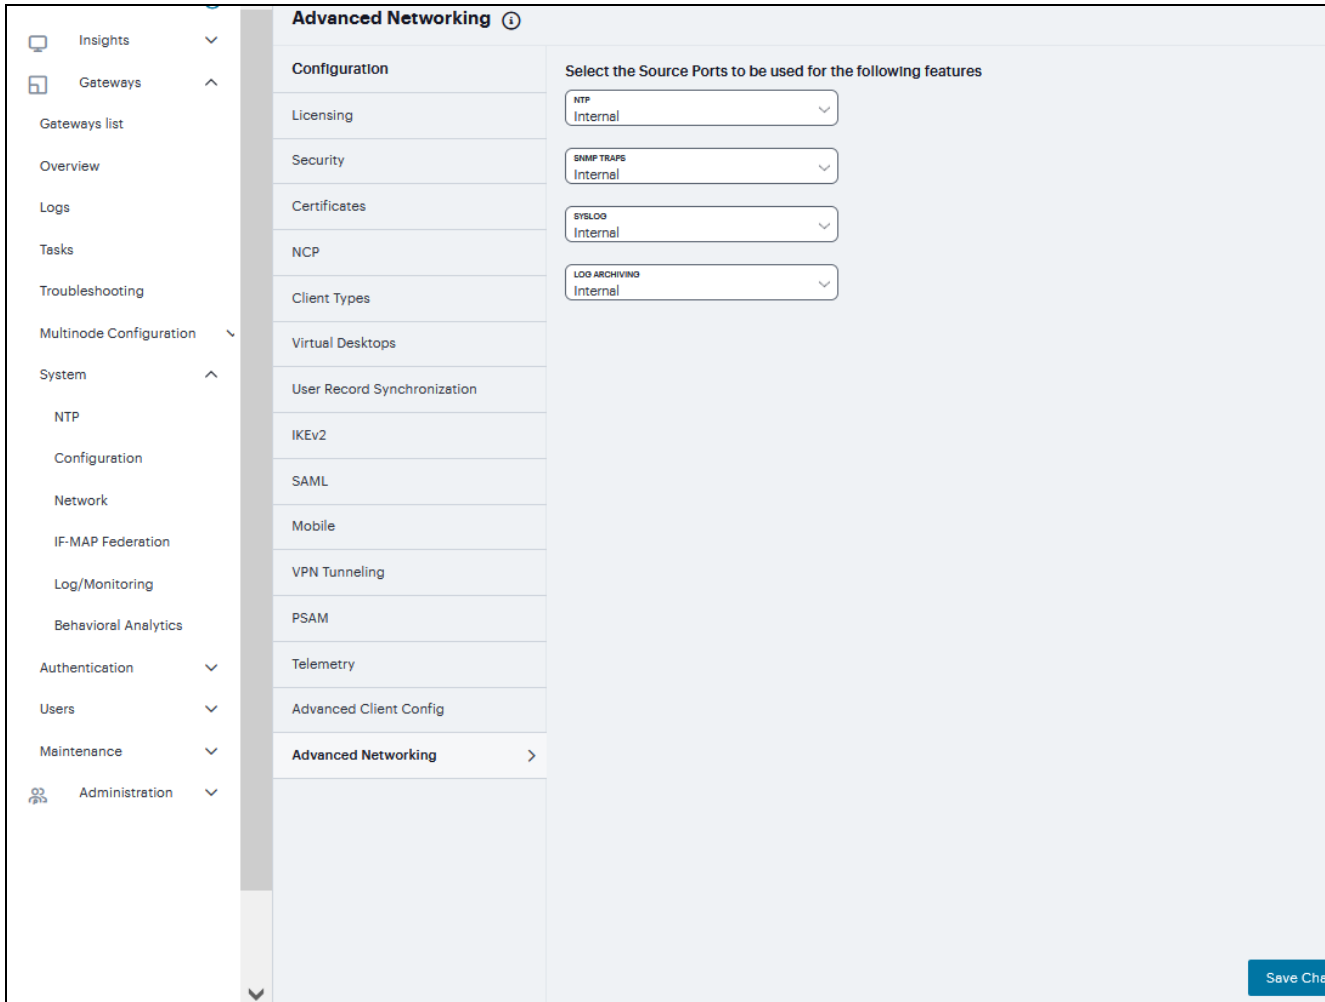

Advanced Networking Configuration

The NTP, SNMP, Syslog, and Log archiving services are set to send the traffic through Management port by default. In case the Management port is not available, the traffic is routed through Internal port. Now, an administrator can modify the settings of NTP and other services to any physical inter-face.

The following procedure describes the steps to configure the ports for the services. Before you proceed, ensure the External and Management ports are enabled for use in the network settings.

To configure Service Traffic Port Options

- 1. Navigate to **System > Configuration > Advanced Networking**.
- 2. For the individual service, select the required port from the drop-down list.
- 3. Click **Save Changes**.

In a cluster environment, when a node joins the cluster, configuration of the node is replaced with the configuration of other nodes in the cluster.

Log/Monitoring

The system generates event logs related to system performance, administrator actions, network communications, access management framework results, user sessions, and so forth. The system supports the following log collection methods:

- Local log collector and log viewer.
- Reporting to syslog servers.
- Reporting to SNMP servers.

The following table lists the Event Log Severity Levels:

Severity Levels	
Severity Level	Description
Critical (level 10)	The system cannot serve user and administrator requests or loses functionality to a majority of subsystems.
Major (levels 8-9)	The system loses functionality in one or more subsystems, but users can still access the system for other access mechanisms.
Minor (levels 5-7)	The system encounters an error that does not correspond to a major failure in a subsystem. Minor events generally correspond to individual request failures.
Info (levels 1-4)	The system writes an informational event to the log when a user makes a request or when an administrator makes a modification.

In addition to managing system logs, you can use the admin console to configure collection of client-side logs, including:

- Host checker
- Windows Secure Application Manager
- Java Secure Application Manager and Applet Rewriting
- VPN Tunneling

- Terminal Services
- Virtual Desktops

Events to Log

To configure log event categories:

1. Select **System > Log/Monitoring**.
2. Click the **Settings** tab to display the configuration page.
3. Complete the configuration as described in table.
4. Click **Save Changes**.

To configure log events for each local log category, you must perform this procedure on each local log tab: Events, User Access, and Admin Access.

The following table lists the Log Events Settings:

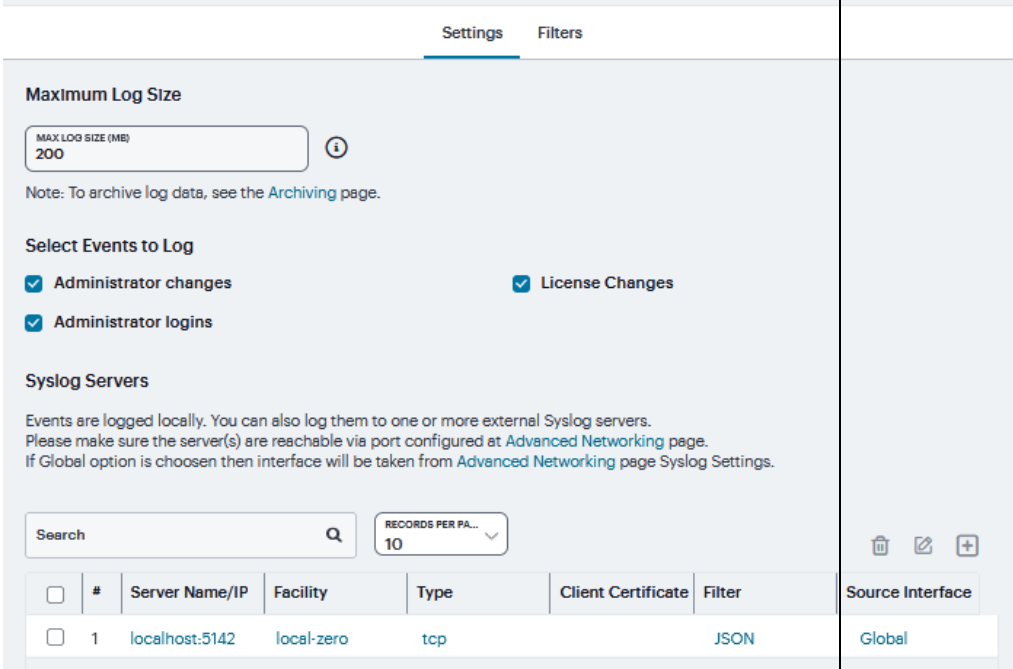

Log Events	
Settings	Guidelines
Maximum Log Size	
Max Log Size	<p>The range is 1- 200 MB and the maximum size is 200 MB for Virtual Appliances. The range is 1- 1024 MB and the maximum is 1GB/1024MB for ISA Hardware. The default is 200 MB. The default is a good choice for logs formatted with the Standard format. If you use a more verbose format, such as WELF, specify a larger value.</p> <p>When the local log reaches the maximum log size, the current data is rolled over to a backup log file. A new, empty, file is then created for all subsequent (new) log messages. The log viewer displays the most recent 5000 log messages (the display limit). If the current log file contains fewer than 5000 log messages, older log messages from the backup log file can be displayed, up to a total of 5000 log messages. This makes the log files appear as one, even though they are stored separately. When you save the log messages or use the FTP archive function, the backup log file is appended to the current log file and is then downloaded as one log file. If the log files are not archived or saved by the time they are rolled over again, the oldest log messages (saved in the backup log file) are lost.</p>

Settings	Guidelines
Archiving	Click the Archiving link to display the configuration page for Archiving jobs, including log archiving.
Select Events to Log - Events Tab	
Connection Requests	Log events related to connection requests.
System Status	Log events related to changes in system status.
Rewrite	Log events related to rewrite policies.
System Errors	Log events related to system errors.
Statistics	Log user access statistics reported on the System > Log/Monitoring > Statistics tab. If you disable the Statistics option, the statistics are not written to the log file, but are still reported on the statistics page.
License Protocol Events	Log events related to licensing.
Reverse Proxy	Logs events related to reverse proxy information.

Settings	Guidelines
System Errors	<p>Log events related to system errors.</p> 
Syslog Servers	click '+' to add new logs. Complete the configuration as described in below rows. You can specify multiple syslog servers.
Server name/IP	<p>Specify the fully qualified domain name or IP address for the syslog server.</p> <p>If you select TLS from the Type list, the server name must match the CN in the subjectDN in the certificate obtained from the server.</p>
Facility	Select a syslog server facility level (LOCAL0-LOCAL7). Your syslog server must accept messages with the following settings: facility = LOG_USER and level = LOG_INFO.
Type	<p>Select the connection type to the syslog server. You can select:</p> <ul style="list-style-type: none">• UDP (User Datagram Protocol) - A simple non-secure transport model.• TCP (Transmission Control Protocol) - A core protocol of the Internet Protocol suite (IP), but lacks strong security.

Settings	Guidelines
	<ul style="list-style-type: none"> • TLS (Transport Layer Security) - Uses cryptographic protocols to provide a secure communication.
Client Certificate	<p>(optional) If you select TLS from the Type menu and your remote syslog server requires client certificates, select the installed client certificate to use to authenticate to the syslog server. Client certificates are defined in the Configuration > Certificates > Client Auth Certificates page. Client certificates must be installed on the device before they can be used. There is no fallback if a connection type fails.</p>
Filter	<p>Select a filter format. Any custom filter format and the following predefined filter formats are available:</p> <ul style="list-style-type: none"> • Standard (default) - This log filter format logs the date, time, node, source IP address, user, realm, event ID, and message. • WELF - This customized Web Trends Enhanced Log Format (WELF) filter combines the standard WELF format with information about the system realms, roles, and messages. • WELF-SRC-2.0-Access Report - This filter adds access queries to the customized WELF filter. You can use this filter with NetIQ's SRC to generate reports on user access methods.
Source Interface	<p>Select the source port type for the syslog server:</p> <ul style="list-style-type: none"> • Global • External • Internal • Management <p>Ensure the servers are reachable through port configured in the Advanced Networking page on the Admin UI.</p>

Log Filters

If desired, you can create custom log collection filters to change the records displayed or exported. For example, it is common to see administrators use a filter for RADIUS accounting logs. This filter allows only the accounting log message, and it puts the entire message in a comma separated list. The order of the filtered message is: Date, Time, User, Realm, "List of Roles", NAS-ID, Acct-Status, Auth-Type, Attr-Value1, Attr-Value2, Attr-Value3.

Accounting attribute messages are different from authentication attribute messages in that the attribute name is not printed in the log message, but a comma is inserted for every attribute to be logged, even if it is not present.

To view the configuration of predefined log format filters:

1. Navigate to System > Log/Monitoring.
2. Click the **Events / User Access / Admin Access** tab.
3. Click the **Filter** tab to display the log filters page.
4. Click the hyperlinked name of the filter to display its configuration page. You cannot edit the predefined filter named Standard, but you may edit the predefined WELF filters and any other custom filters that appear in the list.
5. Click '+' to display the configuration page for creating new filter.
6. Complete the configuration as described in table.
7. Click **Save Changes**.

Log Filters

Settings	Guidelines
Filter Name	Specify a name that is helpful to you and other administrators in understanding usage for your custom filter.
Make default	Make the filter the default on syslog and archiving configuration pages.
Query	Enter a start date. Click Earliest Date to write all logs from the first available date stored in the log file.
Start Date	

Settings	Guidelines
End Date	Enter an end date. Click Latest Date to write all logs up to the last available date stored in the log file.
Query	Use the Filter Variables Dictionary to insert query expressions in the Query box. Enclose the query value in single quotes. For example, insert the query expression sourceip=. Then complete the expression by adding the value '192.168.0.1'.
Export Format	Select an export format: <ul style="list-style-type: none"> • Standard (default) - This log filter format logs the date, time, node, source IP address, user, realm, and message. • WELF - This customized WebTrends Enhanced Log Format (WELF) filter combines the standard WELF format with information about the system realms, roles, and messages. • Custom - Use the Standard as a template for your custom selection of columns to be included in exports (when log collections are saved to files).

Log query filters change only the data displayed (or rows exported). Log format filters change only the data displayed (or columns exported). Use of filters does not affect the log data that has been collected.

Client Side Log

Client-side logging is not enabled by default. If necessary, you can enable client-side logging to troubleshoot any client application issues.

To enable client side logging:

1. Select **System > Log/Monitoring**.
2. Click the **Client Logs** tab to display the configuration page. Complete the configuration as described in Table.
3. Click **Save Changes**.

SNMP

If you prefer, you can use a third-party SNMP manager, such as HP OpenView, to monitor system health. The system supports SNMP v2c and SNMPv3. The system supports two users to be registered with an SNMP engine with different authentication and privilege settings.

To configure the SNMP agent:

1. Select **System > Log/Monitoring**.
2. Click the **SNMP** tab to display the SNMP configuration page.
3. Complete the configuration as described in Table.
4. Click **Save Changes**.

SNMP agent

Settings	Guidelines
MIB File	Use the Ivanti MIB file link to download the device management information base MIB file. You add this file to your SNMP manager configuration.
SNMP Version	<div> Select your SNMP server version: <ul style="list-style-type: none"> v2c v3 </div> <div> <div>MIB File</div> <div> You must download the Ivanti Secure MIB file and install it in your SNMP manager application to monitor the device. The password can contain any ASCII characters and must be at least 8 characters in length.</p> <p>Select either CBC-DES or CFB-AES-128.</p> <p>-Enter a privacy password. The password can contain any ASCII characters and must be at least 8 characters in length.</p>
Trap Thresholds	Setting a threshold value to 0 disables that respective trap.
Check Frequency	Specify the frequency in seconds for sending traps. The default is 180 seconds.
Log Capacity	Specify the percent of log space used. The default is 90%.
Users	Specify the frequency in seconds for sending traps. The default is 180 seconds.
Physical Memory	Specify the percent of physical memory used. The default is 0 (not reported).

Settings	Guidelines
Swap Memory (Virtual Memory)	Specify the percent of swap memory used. The default is 0 (not reported). We recommend you monitor swap memory to alert you to potential memory issues. The threshold for traps for physical memory usage might be reached even if the system is not experiencing any difficulties.
Disk	Specify the percent of disk utilization. The default is 80%.
CPU	Specify the percent of CPU utilization. The default is 0 (not reported). <div data-bbox="558 646 899 1163"> <p>Trap Thresholds Set thresholds for traps.</p> <p>CHECK FREQUENCY (SECONDS) 180 ⓘ</p> <p>LOG CAPACITY (%) 90</p> <p>USERS (%) 100</p> <p>PHYSICAL MEMORY (%) 0</p> <p>SWAP MEMORY (VIRTUAL MEMORY) (%) ⓘ 0</p> <p>DISK (%) 80</p> <p>CPU (%) 0</p> </div>
Optional Traps	
Critical Log Events	Send traps when the system logs critical events.
Major Log Events	Send traps when the system logs major events.
Save SNMP Settings	Click Save Changes to update the SNMP agent configuration. The page is refreshed and displays the SNMP engine ID. If the configuration is changed to move from SNMP v2c to SNMP v3, the system generates and displays two engine IDs.
SNMP Servers	

Settings	Guidelines
Hostname / IP address	Specify the hostname or IP address for the SNMP servers to which the system will send any traps it generates.
Port	Specify the port for the SNMP server. Typically, SNMP uses port 162.
Community (v2c) / User (v3)	<div>Specify the community/user string (if necessary).</div> <div><div><div><div>PHYSICAL MEMORY (%) 0</div><div>SWAP MEMORY (VIRTUAL MEMORY) (%) 0</div><div>DISK (%) 80</div><div>CPU (%) 0</div></div><div><div>Optional traps</div><div><div><input type="checkbox"/> Critical Log Events</div><div><input type="checkbox"/> Major Log Events</div></div><div><div>SNMP Trap Servers</div><div>Specify the servers to which the device will send any traps it generates. Please make sure trap server(s) are reachable via port configured atAdvanced Networking</div><div><div>Search</div><div>ROWS 10</div></div><div><div><input type="checkbox"/></div><div>#</div><div>Hostname/IP Address (IPv4/IPv6)</div><div>Port</div></div></div></div><div><div>Add Server</div><div><div>IP Address</div><div>Port</div><div>Community</div></div><div><div>Cancel</div><div>Save</div></div></div></div></div>

Keep the following configuration tips in mind when you configure your SNMP manager to listen for this SNMP agent:

- Add the Ivanti MIB file to the SNMP manager configuration.
- If using SNMPv2c, the community string configuration for the SNMP manager and SNMP agent must match.
- If using SNMPv3, the SNMPv3 user configuration for the SNMP manager and the SNMP agent must match.
- If using SNMPv3, you must specify the Authoritative Engine ID for SNMPv3 traps that was generated when you saved the SNMP agent configuration.

Advanced Settings

This option helps to configure fault tolerance on each configured TCP and TLS syslog server available. Fault tolerance is supported only for TCP and TLS syslog servers. UDP syslog servers cannot be configured for fault-tolerance. This functionality helps the syslog server to recover the logs lost during a disconnect. The administrator can configure fault-tolerance on syslog servers by enabling this option from the admin UI. ICS/IPS reads the lost pending logs during a disconnect from the log disk and transports them to the syslog server on a reconnect. Fault tolerance is supported only for the syslog servers configured under the following log-types:

- Events
- User Access
- Admin Access

Fault tolerance is node-specific. In case of clusters, the setting needs to be enabled/disabled by logging into each of the cluster members. Fault tolerance is supported only for TCP and TLS syslog servers. UDP syslog servers cannot be configured for fault tolerance.

To configure advance settings to a TCP and TLS syslog server:

1. Navigate to **System > Log/Monitoring**.
2. Click the **Advance Settings** tab to display the configuration page.
3. Complete the configuration as described in Table.
4. Click **Save changes**.

This feature is limited to configuring fault tolerance settings of an existing syslog server; and cannot be used to create or delete a new syslog server.

Behavioral Analytics

Behavioral Analytics feature analyzes user's action along with other context data to derive conclusions about any anomalous activities. It provides information/visibility based on real time user or device context thus helping in advanced attack detection and helps in proactive policy-based enforcement.

The Behavioral Analytics feature addresses the following types of anomaly detection:

- User/device is prompted for second level of authentication based on the threat profile determined for the corresponding user/device.

Below are some scenarios where second level of authentication is required:

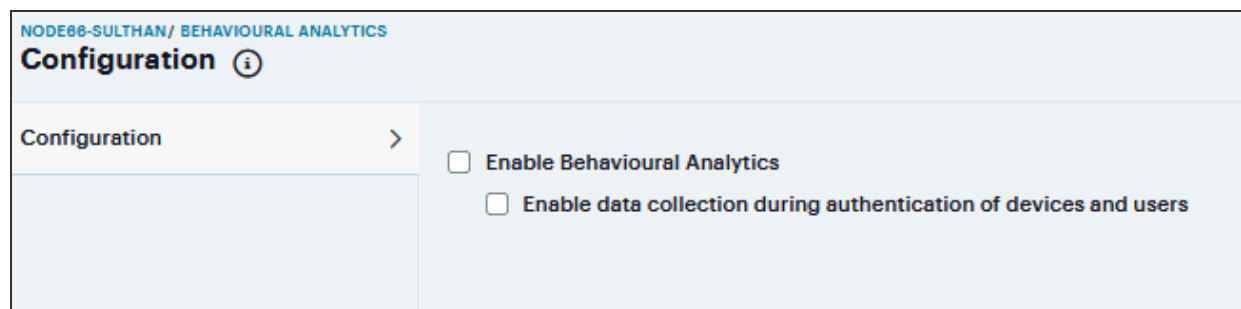

- User authenticating from new device: This is detected by using the device MAC address.
- User authenticating from new location: Location details are obtained by using the location configurations.

Benefits

- ICS monitors the traffic from users and helps in determining the possible anomalous activities such as:
 - If the user is authenticating from a new device / new location.
 - If the device traffic is different from previous instances.
- Data collected as part of Behavior Analytics is stored so that it can be used later for determining the anomalies.

To enable behavioral analytics:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the *Gateways > Gateways List* and then select any standalone ICS Gateway or Cluster node.
3. Navigate to **System > Behavioral Analytics > Configuration**.
4. Under Configurations, select **Enable Behavioral Analytics**.
5. For enabling Adaptive Authentication, select **Enable data collection during authentication of devices and users**.
6. Click **Save Changes**.

NODE86-SULTHAN / BEHAVIOURAL ANALYTICS

Configuration ⓘ

Configuration >

☐ Enable Behavioural Analytics

☐ Enable data collection during authentication of devices and users

In case you have a Fresh Installation of ICS, then it will NOT have UEBA package by default with it.
Please add the UEBA package before using Adaptive Authentication.

Network and Host Administration

- ["Introduction" below](#)
- ["Internal Port Configuration" on the next page](#)
- ["External Port Configuration" on page 269](#)
- ["Management Port Configuration" on page 273](#)
- ["VLAN Ports Configuration" on page 276](#)
- ["Routes Configuration" on page 283](#)
- ["Hosts Configuration" on page 284](#)
- ["VPN Tunnel Configuration" on page 284](#)

Introduction

When you install and initially set up the device, you use the serial port console to set basic network and host settings. To get started, you must use the serial console to configure these settings for the internal interface. You have the option to use the serial console to configure network and host settings for the external interface and the management interface. The network and host settings you configure with the serial port console include:

Once the internal interface has been configured, you can use the admin console Network Settings pages to modify settings for the internal interface, to enable and configure the external interface and the management interface, and to configure or manage advanced networking features, including:

- Hostname
- IPv6 addresses
- VLAN ports
- Virtual ports
- Route table entries
- Host mapping table entries
- ARP cache entries

- Neighbor discovery cache entries
- System date and time (manual configuration) or NTP

Internal Port Configuration

The internal port, also known as the internal interface, handles all LAN requests to resources, listening for Web browsing, file browsing, authentication, and outbound mail requests.

To configure the internal port configuration:

Settings

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.
3. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The All Gateways page is displayed showing a list of standalone ICS Gateways and Cluster nodes.

4. From the **Standalone ICS Gateways** list, click on the gateway link that you want to configure.
5. On the Ivanti Connect Secure menu, select **System > Network > Internal Port > Settings** to display the configuration page.

- Under IPV4 Settings, assign an IP address, assign a Netmask, and specify the IPv4 address for the default Gateway.

BHARATH42/ NETWORK/ INTERNAL PORT

	Default VLAN ID ⓘ			

- Under IPV6 Settings, select IPV6 Status.
- Under Link Local Address, you can see the auto-configured link local address. Specify a routable IPv6 address, Prefix Length, and IPv6 address for the default Gateway.

9. Under Advanced Port, specify the ARP Ping Timeout, maximum transmission unit, and default VLAN ID for the traffic of this port.
10. Click **Save Changes**.

Virtual port - You can use virtual ports to provide different groups of users access to the same system using different IP aliases and domains.

To configure a virtual port:

1. Select **Internal Port > Virtual Ports**. Port is Internal Port or External Port.
2. Click '+' to display the configuration page.
3. Enter a name for the virtual port.
4. Enter the IPv4 address and the IPv6 address.
5. Click **Save Changes**.

ARP Cache - In IPv4 networking, network nodes use ARP to maintain information about peer network nodes.

To manage the ARP table:

1. Select **Internal Port > ARP Cache**. Port is Internal Port, External Port, or Management Port.
2. Click '+' to display the configuration page.
3. Enter an IP address, and a MAC address.
4. Click **Save Changes** to add an entry.
5. You can delete all dynamically discovered entries.

ND Cache - In IPv6 networking, network nodes use the Neighbor Discovery Protocol (NDP) to determine the Layer 2 MAC addresses for neighboring hosts and routers.

To manage the neighbor discovery table:

1. Select **Internal Port > ND Cache**. Port is Internal Port, External Port, or Management Port.
2. The **Flush NDP Entries** deletes all dynamically discovered entries.

External Port Configuration

The external port, also known as the external interface, handles all requests from users signed into Ivanti Connect Secure from outside the customer LAN, for example, from the Internet. Before sending a packet, Ivanti Connect Secure determines if the packet is associated with a TCP connection that was initiated by a user through the external interface. If that is the case, Ivanti Connect Secure sends the packet to the external interface. All other packets go to the internal interface.

To configure the external port configuration:

Settings

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.
3. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The All Gateways page is displayed showing a list of standalone ICS Gateways and Cluster nodes.

4. From the **Standalone ICS Gateways** list, click on the gateway link that you want to configure.

5. On the Ivanti Connect Secure menu, select **System > Network > External Port > Settings** to display the configuration page.

Virtual Ports - You can use virtual ports to provide different groups of users access to the same system using different IP aliases and domains.

To configure a virtual port:

1. Select **External Port > Virtual Ports**. Port is Internal Port or External Port.
2. Click '+' to display the configuration page. Specify a name for the virtual port, an IPv4 address, and an IPv6 address.
3. Click **Save Changes**.

ARP Cache - In IPv4 networking, network nodes use ARP to maintain information about peer network nodes.

To manage the ARP table:

1. Select **External Port > ARP Cache**. Port is Internal Port, External Port, or Management Port.
2. Click '+' and specify an IP address, a MAC address.
3. Click **Save Changes** to add an entry.
4. You can delete all dynamically discovered entries.

ND Cache - In IPv6 networking, network nodes use the Neighbor Discovery Protocol (NDP) to determine the Layer 2 MAC addresses for neighboring hosts and routers.

To manage the neighbor discovery table:

1. Select **External Port > ND Cache**. Port is Internal Port, External Port, or Management Port.
2. The **Flush NDP Entries** deletes all dynamically discovered entries.

Management Port Configuration

You connect the management port to an Ethernet switch or router that is part of your internal local area network (LAN) and that can connect to your network management infrastructure. When the management port is enabled, the following traffic is directed out the management port: archiving (FTP/SCP), NTP, push config, SNMP, syslog. When the management port is not enabled, that traffic uses the internal port.

To configure the management port:

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.
3. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The All Gateways page is displayed showing a list of standalone ICS Gateways and Cluster nodes.

4. From the **Standalone ICS Gateways** list, click on the gateway link that you want to configure.

5. On the Ivanti Connect Secure menu, select **System > Network > Management Port > Settings** to display the configuration page.

To manage the neighbor discovery table:

1. Select **Management Port > ND Cache**. Port is Internal Port, External Port, or Management Port.
2. The **Flush NDP Entries** deletes all dynamically discovered entries.

VLAN Ports Configuration

Your network design might include VLANs to provide network segmentation. When connected to a trunk port on a VLAN-enabled switch, the system encounters traffic from all VLANs. This is useful for network designs with separate VLANs for separate classes of users or endpoints, and for making the system accessible from all VLANs. You can use RADIUS attributes to place different users in different network segments.

The system supports IEEE 802.1Q VLAN tagging. You must define a VLAN port for each VLAN. The internal port must be assigned to the root system and must be marked as the default VLAN. Routes to servers reachable from the VLAN interfaces must have the next-hop gateway set to the configured gateway for the VLAN interface, and must have the output port defined as the VLAN port.

When you save the configuration for a new VLAN port, the system creates two static routes by default:

- The default route for the VLAN pointing to the default gateway.
- The interface route to the directly connected network.

To configure an internal VLAN port:

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.
3. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The All Gateways page is displayed showing a list of standalone ICS Gateways and Cluster nodes.

4. From the **Standalone ICS Gateways** list, click on the gateway link that you want to configure.
5. On the Ivanti Connect Secure menu, select **System > Network > VLANs > Internal Port** to display the configuration page.
6. Select **VLANs > Internal Port**.

- Click '+', a New VLAN Port -Settings opens.

8. Click **Save Changes**.

Routes Configuration

The system populates the routes table with dynamic, auto-discovered routes. Many networks will not require changes to this routing table. If necessary, you can delete routes or add static routes.

To manage the routes table:

1. In the Routes page, use the controls to change the display to show the route table for internal, external, or management interfaces; and for IPv4 or IPv6 routes.
2. Click '+' and complete the configuration to add a route to the table.

The image shows a 'New Route' configuration form. It has a light blue header with the title 'New Route'. Below the header are five input fields: 'Destination Network/IP', 'Netmask', 'Gateway', 'INTERFACE' (a dropdown menu with 'Internal' selected), and 'Metric (0 - 15)'. At the bottom of the form are two buttons: a blue 'Save Changes' button and a light blue 'CANCEL' button.

3. Specify a valid IP address, Gateway, DNS address, and select the Interface and metric.
4. Click **Save Changes**.

Hosts Configuration

In general, the system uses the configured DNS servers to resolve hostnames, but it also maintains a local hosts table that can be used for name resolution. The system populates some entries from host-IP address pair settings in your configuration. You can add host-IP address mappings for other hosts that might not be known to the DNS servers used by the system, or in cases where DNS is not reachable.

To configure hosts table:

1. In the Hosts page, click '+ '.

A screenshot of a 'New Host' configuration form. The form has a light blue header with the title 'New Host'. Below the header are three input fields: 'IP Address', 'Name(s)', and 'Comment'. At the bottom of the form are two buttons: 'Cancel' and 'Save Changes'.

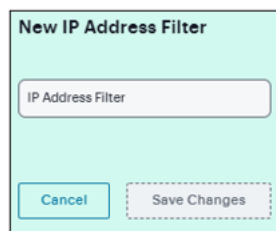

2. Specify an IP address, hostname, and comment (a description for the benefit of system administrators).
3. Click **Save Changes**.

VPN Tunnel Configuration

The VPN tunneling access option (formerly called Network Connect) provides a VPN user experience, serving as an additional remote access mechanism to corporate resources using Connect Secure. The VPN Tunneling Server uses the filter list to assign IP addresses to clients requesting a VPN client session. A filter is an IP address/netmask combination. For example: 10.11.0.0/255.255.0.0 or 10.11.0.0/16.

To add an IP address to the VPN tunneling filter list:

1. In the VPN tunneling page, click +, and enter an IP address/netmask combination.

A dialog box titled "New IP Address Filter" with a light blue background. It contains a text input field labeled "IP Address Filter" with a light blue border. Below the input field are two buttons: a solid blue "Cancel" button and a dashed blue "Save Changes" button.

2. In the **VPN Tunnel Server IP Address** text box, enter the base IP address used by the VPN tunneling server to assign IP addresses to the tunnel interfaces created for VPN Tunneling sessions.
3. Click **Save Changes**.

Only change the VPN tunneling server base IP address when instructed to do so by the Ivanti Support team.

Authentication and Directory Servers

- ["Introduction" below](#)
- ["AAA Traffic Management" below](#)
- ["Configuring Local Authentication Server" on page 288](#)
- ["Configuring ACE Authentication Server" on page 290](#)
- ["Configuring RADIUS Authentication Server" on page 291](#)
- ["Configuring Certificate Authentication Server" on page 296](#)
- ["Configuring LDAP Authentication Server" on page 297](#)

- ["Configuring TOTP Authentication Server" on page 306](#)
- ["Configuring MDM Authentication Server" on page 309](#)
- ["Configuring Active Directory Authentication Server" on page 312](#)

Introduction

The access management framework supports the following types of AAA servers: Local, External (standards-based), and External (other).

- Local includes "Local Authentication Server", "Certificate Server".
- External (standards-based) includes "LDAP Server", "RADIUS Server".
- External (other) includes "MDM Server", "RSA ACE Server", "TOTP Server".

AAA Traffic Management

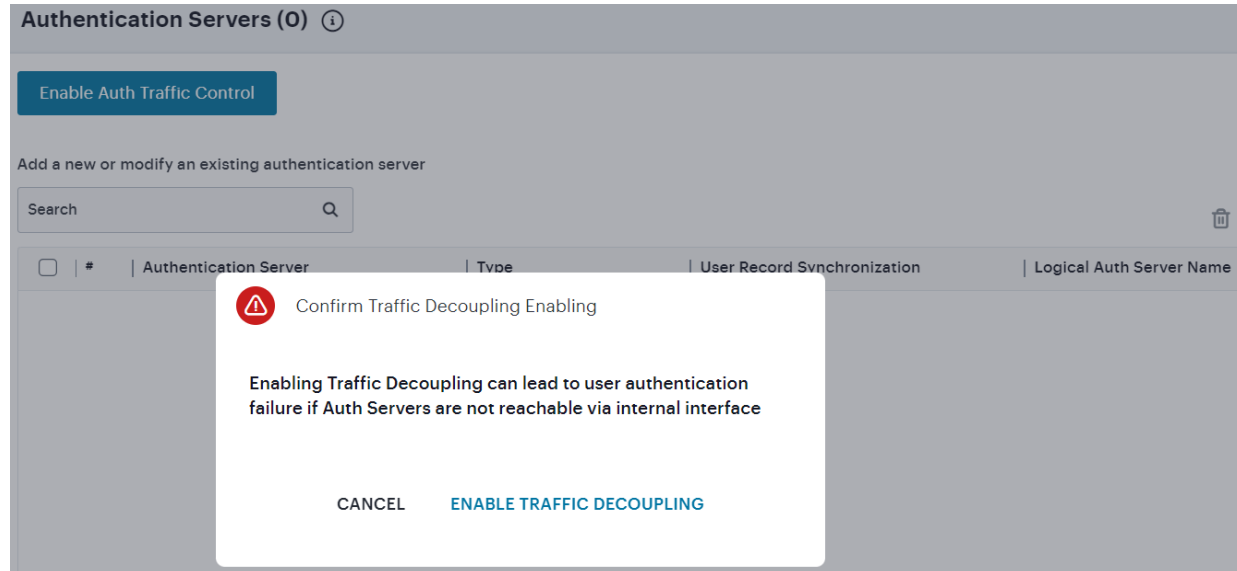

Ivanti Connect Secure Virtual appliances and Appliances allow the administrator to choose the communicating interface or the network for each authentication server.

This feature allows the AAA traffic across physical interfaces, VLAN ports, and virtual ports on physical and VLAN ports.

Configuring AAA Traffic Management Across Interfaces

To configure AAA traffic management across interfaces:

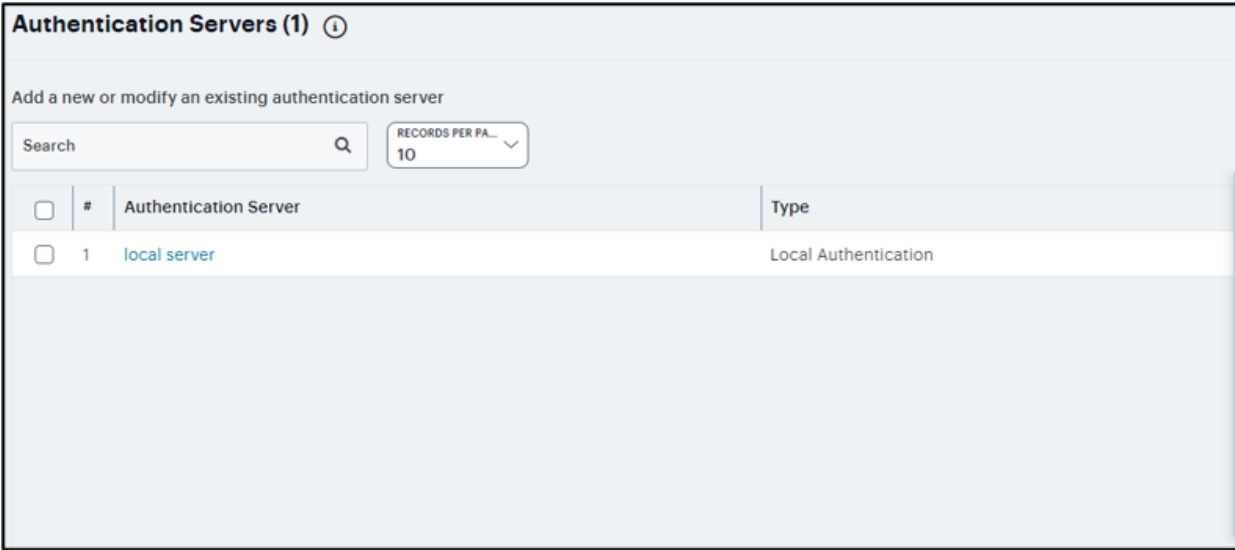

1. Select the gateway from the Gateways list, and click **Authentication > Authentication Servers**.
2. Click **Enable Auth Traffic Control**.
3. In the Confirm Traffic Decoupling Enabling prompt, click **Enable Traffic Decoupling**.

Configuring Authentication Servers

To add an authentication server:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click **Gateways > Gateways List**. In the Gateways list page, select the standalone ICS Gateway or Cluster node that you want to configure.
3. From the ICS menu, click **Authentication > Authentication Servers**.
4. Click the Add icon and select the Authentication server type from the list.

Configuring Local Authentication Server

You can create multiple local authentication server instances. When you define a new local authentication server, you must give the server a unique name and configure options for passwords.

To create a local authentication server:

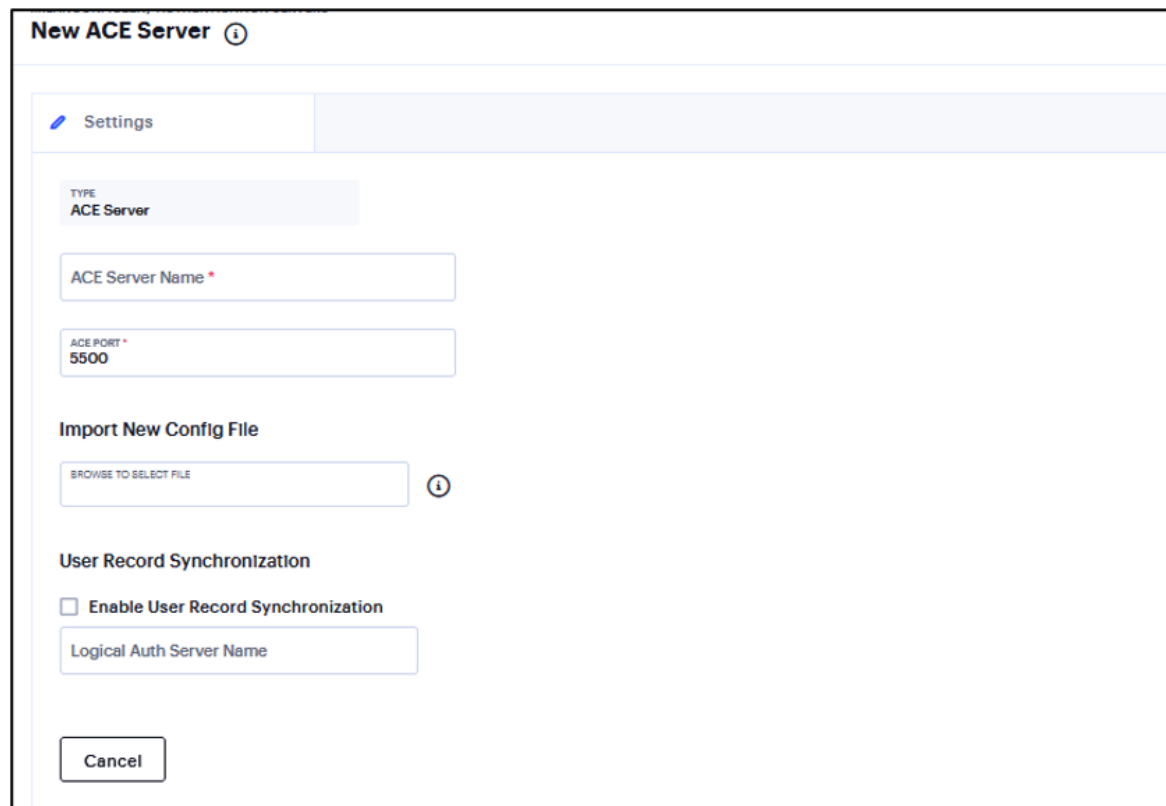

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **Local** from the list to display the configuration page.

3. Complete the configuration and save changes.

- Enter a Server Name.
- Select **Password Options**.
- Select the **Allow users to change passwords** option if you want users to be able to change their passwords.
- Select the **Force password change after** option to specify the number of days after which a password expires. The default is 64 days.
- Select the **Prompt users to change password** option to specify when to prompt the user to change passwords.
- Select the **Enable account lockout for users** option to manage user authentication failures for admin users of local authentication server.
- Enter the number of consecutive wrong password attempts after which the admin user account will be locked. The default value is 3 retries.

To configure authentication with the ACE server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **ACE** from the list to display the configuration page.
3. Complete the configuration and save changes.
 - Enter a Server Name.
 - Enter the default port of the authentication server.
 - Click and browse **Import New Config File** to upload the sdconf.rec configuration file.
 - Select the **Enable User Record Synchronization** option to retain the bookmarks and individual preferences regardless of which system you log in to.
 - Enter a logical authentication server name.

The screenshot shows the 'New ACE Server' configuration page. At the top, there is a title bar with 'New ACE Server' and an information icon. Below the title bar, there is a 'Settings' tab. The main content area contains the following fields and options:

- TYPE**: A dropdown menu showing 'ACE Server'.
- ACE Server Name ***: A text input field.
- ACE PORT ***: A text input field with the value '5500'.
- Import New Config File**: A section with a 'BROWSE TO SELECT FILE' button and an information icon.
- User Record Synchronization**: A section with a checkbox labeled 'Enable User Record Synchronization' and a text input field labeled 'Logical Auth Server Name'.
- Cancel**: A button at the bottom left.

Configuring RADIUS Authentication Server

To configure authentication with the RADIUS server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **RADIUS** from the list to display the configuration page.

3. Complete the configuration and save changes.

Settings page

- Enter a Server Name.
- Enter the name that identifies the Network Access Server (NAS) client to the RADIUS server.
- Enter the name or IP address of the RADIUS server.
- Enter the authentication port value for the RADIUS server. Default port number: 1812, 1645 (legacy servers).
- Enter the NAS IP address. If you leave this field empty, the internal IP address is passed to RADIUS requests. You can also fill this field with IPv6 address.
- Enter the interval of time in seconds to wait for a response from the RADIUS server before timing out the connection.
- Enter the number of times to try to make a connection after the first attempt fails.
- Select the **Users authenticate using tokens or one-time passwords** option to prompt the user for a token instead of a password.

- Click **Next**.

Configuring Certificate Authentication Server

The certificate server is a local server that allows user authentication based on the digital certificate presented by the user without any other user credentials.

To configure authentication with the Certificate server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **Certificate** from the list to display the configuration page.
3. Complete the configuration and save changes.
 - Enter a Server Name.
 - Enter a username template. Specify how the system should construct a username. You may use any combination of certificate variables contained in angle brackets and plain text.
 - Select the **Enable User Record Synchronization** option to retain the bookmarks and individual preferences regardless of which system you log in to.
 - Enter a logical authentication server name.
 - From the drop-down list, select the Secondary Authentication server. From 22.6R1 version, *nSA* supports SAML Authentication server as a Secondary Authentication server.

Configuring LDAP Authentication Server

Lightweight Directory Access Protocol (LDAP) facilitates the access of online directory services. LDAP directory consists of a collection of attributes with a name, known as a distinguished name (DN). Each of the entry's attributes, known as a relative distinguished name (RDN), has a type and one or more values. The types are typically mnemonic strings, such as CN for common name. The valid values for each field depend on the types.

To configure authentication with the LDAP server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **LDAP** from the list to display the configuration page.

3. Complete the configuration and save changes.

Settings page

- Enter a Server Name.
- Select the **Enable Domain Name** option if you want to fetch a list of servers from the DNS server. Clear this option if you want to manually enter all the domain controllers host names.
- Enter the LDAP server name or the IP address.
- (Optional) Enter the parameters for backup LDAP server1. Default port number: 389
- Enter the parameters for backup LDAP port1.
- (Optional) Specify the parameters for backup LDAP server2.
- Enter the parameters for backup LDAP port2.
- Select the backend LDAP server type from the following choices: Generic, Active Directory, iPlanet, Novell eDirectory.
- Select one of the following options for the connection to the LDAP server:
 - Unencrypted - The device sends the username and password to the LDAP Directory Service in cleartext.
 - LDAPS - The device encrypts the data in the LDAP authentication session using the Secure Socket Layer (SSL) protocol before sending it to the LDAP Directory Service.
 - Start TLS - The device allows both secure and plain requests against an LDAP server on a single connection.
- Enter the time (in seconds) to wait for connection to the primary LDAP server, and then to each backup LDAP server. Default: 15 seconds

- Enter the time (in seconds) to wait for search results from a connected LDAP server.

Remove Domain from Windows user names
If users authenticate using Windows user names containing domain prefixes (for example: CORP\joe), it may be necessary to remove the domain prefix in order for authentication to succeed. If you choose this option, the <NTDOMAIN> variable is set to the removed from the user name.

☐ Strip domain from Windows user names

Cancel Back Next

- Under **Finding user entries**:
 - Enter the base DN under which the users are located. For example, dc=sales,dc=acme,dc=com.
 - Enter a unique variable that can be used to do a fine search in the tree. For example, samAccountname= <username> or cn= <username>.
 - Select the **Strip domain from Windows username** option to pass the username without the domain name to the LDAP server.

- Click **Next**.

Membership & Sync page

- Enter the base DN to search for user groups.
- Enter a unique variable which can be used to do a fine search in the tree. For example, samAccountname= <username> or cn= <GROUPNAME>.
- Enter all the members of a static group. For example, member or uniquemember (iPlanet specific Deprecated for 21.x).
- Select the **Reverse group search** option to start the search from the member instead of the group. This option is available only for Active Directory server types.
- Enter an LDAP query that returns the members of a dynamic group. For example, memberURL.
- Enter how many levels within a group to search for the user. The higher the number, the longer the query time, so we recommend that you specify to perform the search no more than two levels deep.
- Select one of the following options: Nested groups in Server Catalog, Search all nested groups.

The screenshot shows the 'Membership & Sync' configuration page. At the top, there are tabs for 'Settings', 'Authentication & Users', and 'Membership & Sync'. The main section is titled 'Determining group membership' with a note: 'If group membership is NOT reflected as attributes of a user's entry, specify how to find a group's entries. Note that these are default settings that you can change on a group basis in the Server Catalog.'

The configuration fields include:

- Base DN**: A text input field with an information icon.
- Filter**: A text input field with an information icon.
- Member Attribute**: A text input field with an information icon.
- Query Attribute**: A text input field with an information icon.
- NESTED GROUP LEVEL**: A text input field containing the value '0' with an information icon.
- NESTED GROUP SEARCH**: A dropdown menu currently showing 'Nested groups in Server Catalog' with an information icon.

Below these fields is the 'User Record Synchronization' section, which includes:

- An unchecked checkbox labeled 'Enable User Record Synchronization'.
- A text input field labeled 'Logical Auth Server Name'.

At the bottom of the page, there are two buttons: 'Cancel' and 'Back'.

Configuring SAML Authentication Server

SAML is an XML-based framework for communicating user authentication, entitlement, and attribute information. The standard defines the XML-based assertions, protocols, bindings, and profiles used in communication between SAML entities. SAML is used primarily to implement Web browser single sign-on (SSO). SAML enables businesses to leverage an identity-based security system like Ivanti Connect Secure to enforce secure access to web sites and other resources without prompting the user with more than one authentication challenge.

For complete details on the SAML standard, see the OASIS web site:

To configure authentication with the SAML server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **SAML** from the list to display the configuration page.
3. Complete the configuration and save changes.

Settings

- Enter a name to identify the server instance.
- Select SAML version used by the SAML IdP.
- Select to override the Host FQDN for the SAML server. Host FQDN is used to update the Unique SAML Identifier and ACS URL of the SAML Authentication Server.
- Select Manual or Metadata for Configuration Mode. If a metadata file or location is available from the SAML identity provider, use the metadata option to make configuration simpler and less prone to error.
- Enter **Identity Provider Entity ID**. The identity provider entity ID is sent as the Issuer value in the assertion generated by the SAML identity provider.
- Enter **Identity Provider Single Sign On Service URL**. The identity provider SSO service URL is a URL provisioned by the SAML identity provider. The setting is required to support service-provider-initiated SSO.
- Specify **User Name Template** to derive the username from the assertion.

- Specify the maximum allowed difference in time between the system clock and the SAML identity provider server clock.
- Select **Support Single Logout**. Single logout is a mechanism provided by SAML for logging out a particular user from all the sessions created by the identity provider. Select this option if the system must receive and send a single logout request for the peer SAML identity provider.
- Click **Save Changes**. The SAML Authentication Server gets listed in the Authentication Servers page.

Metadata Settings

- Select the **Metadata** tab.
- Enter the number of days the metadata is valid. Valid values are 0 to 9999. 0 specifies the metadata does not expire.
- Select **Do Not Publish SA Metadata** if you do not want to publish the metadata at the location specified by the **Entity ID** field.
- Select **Download Metadata**. This button appears only after you have saved the authentication server configuration. Use this button to download the metadata of the current SAML service provider.
- Click **Save Changes**.

The screenshot shows a web interface for configuring metadata. At the top, there's a header 'Metadata' with an information icon. Below it, there are three tabs: 'Settings', 'SSO', and 'Metadata' (which is active and highlighted with a blue icon). Under the 'Metadata' tab, the section is titled 'Service Provider Metadata Settings'. It contains a text input field labeled 'Metadata Validity' with an information icon to its right. Below this is a checkbox labeled 'Do Not Publish Connect Secure Metadata'. A small text description below the checkbox reads: 'Prevents the Metadata for the SAML Auth Server to be published at the location specified by the Connect Secure Entity Id.' At the bottom of the form, there are two buttons: 'Cancel' and 'Back'.

Configuring TOTP Authentication Server

Time-based One-Time Password (TOTP) algorithm as defined in RFC6238 is an authentication mechanism where a one-time password (a.k.a token) is generated by the authentication server and client from a shared secret key and the current time. ICS can act as TOTP authentication server. Any third-party TOTP applications (for example, Windows Authenticator or Google Authenticator) available on the mobile and desktop client platforms generate TOTP tokens.

To configure the TOTP server as Local:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **TOTP** from the list to display the configuration page.
3. Complete the configuration and save changes.

TOTP Auth Server Settings - Local

- Select **Local** as Server Type. TOTP context is created locally and user database is maintained locally on the same device.
- Time Skew - Specify maximum time difference between Ivanti Connect Secure and end user device while authenticating a user's token. (minimum: 1 minute, maximum: 5 minutes).
- Number of attempts allowed - Specify maximum number of consecutive wrong attempts allowed after which account will be locked (minimum: 1 attempt, maximum: 5 attempts).
- Custom message for registration page - Specify a custom message which can be shown on new TOTP user registration web-page.
- Allow Auto Unlock - When checked, locked account will be automatically unlocked after specified period. (minimum: 10 minutes, maximum: 90 days).
- Allow new TOTP user registration to happen via external port - When unchecked (default), new TOTP user registrations will happen only via internal port.
- Accept TOTP authentication from remote ICS devices - When checked, REST access to this TOTP server is allowed from other Ivanti Connect Secure devices.
- Display QR code during user registration - When checked, displays QR code during user registration.

- Disable generation of backup codes - When unchecked, generates backup codes.

TOTP Auth Server Settings - Remote

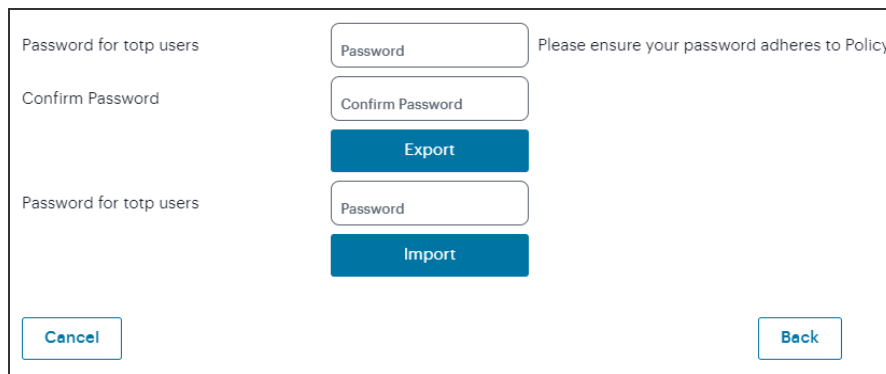

- Select **Remote** as Server Type. In this configuration, authentication checks take place on the remote TOTP server.
- If the **Allow new TOTP user registration to happen via external port** option is not selected, new TOTP user registrations happen only via company intranet network.
- Enter remote host name or IP address where the TOTP server is configured. The IP address or host name must match the common name mentioned in the remote TOTP server certificate.
- Enter TOTP Server Name configured on the Remote TOTP server.

- Enter the REST API login name.
- Enter the REST API password.
- Enter the realm name, which refers to the realm that should be used for authenticating the REST user (using the auth. server mapped to the Realm).
- Use the Test Connection button to validate the connection to the remote TOTP server.

Exporting/Importing TOTP Users

To export/import TOTP users:

1. Select **Authentication > Authentication Servers**.
2. Click the link for the authentication server you want to manage.
3. Click the **Users** tab to display the user accounts table. The user accounts table includes entries for the accounts that have been created.
4. Use the **Export** and **Import** buttons located at the bottom of the user accounts table to export and import TOTP users data.

The screenshot shows a dialog box for exporting and importing TOTP users. It contains two password input fields, one for export and one for import, each with a 'Confirm Password' field. The export section has an 'Export' button, and the import section has an 'Import' button. There are 'Cancel' and 'Back' buttons at the bottom. A note on the right says 'Please ensure your password adheres to Policy'.

Password for totp users	<input type="password"/>	Please ensure your password adheres to Policy
Confirm Password	<input type="password"/>	
	<input type="button" value="Export"/>	
Password for totp users	<input type="password"/>	
	<input type="button" value="Import"/>	
<input type="button" value="Cancel"/>		<input type="button" value="Back"/>

5. (Optional) To enhance the security of the TOTP users' data, Ivanti recommends to encrypt the data with a password. This password should adhere to Ivanti Password policy. To import the user data, enter the password if file is password protected.

Configuring MDM Authentication Server

The access management framework MDM authentication server configuration includes details on how the system communicates with the MDM Web RESTful API service and how it derives the device identifier from the certificates presented by endpoints.

To configure authentication with the MDM server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **MDM** from the list to display the configuration page.
3. Complete the configuration and save changes.
 - Type - Select one of the following options: VMWare Workspace One (formerly AirWatch), Ivanti (formerly MobileIron), Microsoft Intune

Applicable to VMWare Workspace One and Ivanti

- Enter the URL for the MDM server. This is the URL the MDM has instructed you to use to access its RESTful Web API (also called a RESTful Web service).
- Enter the URL for the MDM report viewer. This URL is used for links from the Active Users page to the MDM report viewer.
- Enter a timeout period (5-60 seconds) for queries to the MDM server. The default is 15 seconds.
- Enter the username and password for an account that has privileges to access the MDM RESTful Web API.
- (AirWatch only) Copy and paste the AirWatch API tenant code.

Applicable to Microsoft Intune

- Enter Azure AD Tenant ID.
- Enter Web application ID that has been registered in Azure AD.
- Enter Secret key of the web application registered in azure AD.
- Enter a timeout period (5-60 seconds) for queries to the MDM server. The default is 15 seconds.

Device Identifier

- Construct a template to derive the device identifier from the certificate attributes. The template can contain textual characters as well as variables for substitution.

- Select the device identifier type that matches the selection in the MDM SCEP certificate configuration:
 - UUID - The device Universal Unique Identifier. This is the key device identifier supported by MobileIron MDM.
 - Serial Number - The device serial number.
 - UDID - The device Unique Device Identifier. This is the key device identifier supported by AirWatch MDM.
 - Device ID - The device unique identifier.

Configuring Active Directory Authentication Server

Active Directory is a directory service used in Windows domain networks. It is included in most Windows server operating systems. Enterprise servers that run Active Directory are called domain controllers. An Active Directory domain controller authenticates and authorizes users and computers in a Windows domain network.

When you use Active Directory as the authentication and authorization service for your Ivanti access management framework, users can sign in to Ivanti Connect Secure using the same username and password they use to access their Windows desktops. You can also use Active Directory group information in role mapping rules.

To configure authentication with the MDM server:

1. Select **Authentication > Authentication Servers**.
2. Click the Add icon and select **Active Directory** from the list to display the configuration page.
3. Complete the configuration and save changes.
 - Specify a name to identify the server within the system.
 - Specify the NetBIOS domain name for the Active Directory domain.
 - Specify the FQDN of the Active Directory domain.
 - Specify a username that has permission to join computers to the Active Directory domain.
 - Specify the password for the special user.
 - Select **Save Credentials**. If this setting is not enabled, the credentials entered will be destroyed after successfully joining the domain.
 - Specify the machine account name. The default computer name is derived from the license hardware in the following format: 0161MT2L00K2C0. We recommend the Computer Name string contain no more than 14 characters to avoid potential issues with the AD/NT server. Do not include the '\$' character.

- Specify the protocol to use during authentication. The system attempts authentication using the protocols you have enabled in the order shown on the configuration page. For example, if you have selected the check boxes for Kerberos and NTLMv2, the system sends the credentials to Kerberos. If Kerberos succeeds, the system does not send the credentials to NTLMv2. If Kerberos is not supported or fails, the system uses NTLMv2 as the next protocol in order.
- Contact trusted domains. Select this option to contact domain controllers of trusted domains directly without proxying authentication requests and group membership checks through the domain controller.
- Enter the maximum number of simultaneous domain connections (1 to 10).
- Enable periodic password change of machine account. Select this option to change the domain machine account password for this configuration.

- Click **Save Changes**.

Sign-in Policies

- ["Introduction" below](#)
- ["Defining Authorization-Only Access Policies" on page 319](#)
- ["Configuring Sign-In Pages" on page 323](#)
- ["Sign-in Notifications" on page 331](#)
- ["Sign-in SAML" on page 335](#)

Introduction

Sign-in policies define the URLs that users and administrators use to access the device and the sign-in pages that they see. The system has two types of sign-in policies - one for users and one for administrators. When configuring sign-in policies, you associate realms, sign-in pages, and URLs.

For example, in order to allow all users to sign in to the device, you must add all user authentication realms to the user sign-in policy. You may also choose to modify the standard URL that the end-users use to access the system and the sign-in page that they see. Or, if you have the proper license, you can create multiple user sign-in policies, enabling different users to sign into different URLs and pages.

You can create multiple sign-in policies, associating different sign-in pages with different URLs. When configuring a sign-in policy, you must associate it with a realm or realms. Then, only members of the specified authentication realm(s) may sign in using the URL defined in the policy. Within the sign-in policy, you may also define different sign-in pages to associate with different URLs.

For example, you can create sign-in policies that specify:

- Members of the "Partners" realm can sign in to the device using the URLs: partner1.yourcompany.com and partner2.yourcompany.com. Users who sign into the first URL see the "partners1" sign-in page; users who sign into the second URL see the "partners2" sign-in page.
- Members of the "Local" and "Remote" realms can sign into the device using the URL: employees.yourcompany.com. When they do, they see the "Employees" sign-in page.
- Members of the "Admin Users" realm can sign into the device using the URL: access.yourcompany.com/super. When they do, they see the "Administrators" sign-in page.

When defining sign-in policies, you may use different hostnames (such as `partners.yourcompany.com` and `employees.yourcompany.com`) or different paths (such as `yourcompany.com/partners` and `yourcompany.com/employees`) to differentiate between URLs.

To create or configure user sign-in policies:

1. Navigate to **Authentication > Signing In > Sign-in Policies**.
 2. Select the **Enable multiple user sessions** check box to allow users to have multiple concurrent sessions, and specify whether the user can log in when the maximum number of sessions is reached:
 - **Deny any more session from the user** - Displays a message saying the login is denied because it would exceed the maximum number of concurrent sessions.
 - **Allow the user to login** - Allows the user to log in. If the Display open user session[s] warning notification option is enabled, the user can select which session to close; otherwise the session that has been idle the longest is closed automatically.
 3. Select the **Display open user session[s] warning notification** check box to allow users who have met the maximum session count to close one of their existing sessions before continuing with the current log in. If this option is disabled, the system terminates the session that has been idle the longest. This option applies only if Enable multiple user sessions is enabled along with Allow the user to log in. Specify when the user is warned about concurrent sessions:
 - Select **Always** to notify users each time they log in when they already have another active session
 - Select **If the maximum session limit per user for the realm has been reached** to display the warning message only when the user's maximum session count has been met.
 4. To enable or disable an individual policy, select the check box next to the policy that you want to change, and then click **Enable** or **Disable**.
-
- 
- If you select this option, all user sessions are immediately terminated. If this device is part of a cluster, all user sessions across all nodes in the cluster are immediately terminated.
-
5. To create a new sign-in policy, click '+'. Or, to edit an existing policy, click a URL in the Administrator URLs or User URLs column.
 6. Select **Users** to specify which type of user can sign in using the access policy.

7. In the **Sign-in URL** field, enter the URL that you want to associate with the policy. Use the format <host>/<path> where <host> is the hostname of the device, and <path> is any string you want users to enter. For example: partner1.yourcompany.com/outside. To specify multiple hosts, use the * wildcard character.

Sign-in Policies

Sign-in Policies

☐ **Enable multiple user sessions**
Select this check box and enter the maximum number of sessions per user per realm in Users > User Realms > [Realm Name] > Authentication Policy > Limits page. By default, this is 1, or one session per user per realm. If you do not select this check box, you limit the user to one session for all realms of this user.

☒ **Display open user session[s] warning notification**
Check this option to notify users if they have other active session[s] in progress when they attempt to sign-in. The user has to follow the instructions on the warning notification page to proceed or cancel the login.

Enable Disable

<input type="checkbox"/>	#	User URLs	Sign-In Page	Authentication Realm(s)	Enabled
<input type="checkbox"/>	1	/	Default Sign-In Page	Users	✓

No Data Available

To specify that all administrator URLs should use the sign-in page, enter (/admin)*.

- You may only use wildcard characters (*) in the beginning of the hostname portion of the URL. The system does not recognize wildcards in the URL path.
 - SAML authentication does not support sign-in URLs that contain multiple realms. Instead, map each sign-in URL to a single realm.
8. (optional) Enter a **Description** for the policy.
9. From the **Sign-in Page** list, select the sign-in page that you want to associate with the policy. You may select the default page that comes with the system, a variation of the standard sign-in page, or a custom page that you create using the customizable UI feature.

10. Under **Authentication realm**, specify which realm(s) map to the policy, and how users and administrators should pick from amongst realms. If you select:
 - **User types the realm name** - The system maps the sign-in policy to all authentication realms, but does not provide a list of realms from which the user or administrator can choose. Instead, the user or administrator must manually enter his realm name into the sign-in page.
 - **User picks from a list of authentication realms** - The system only maps the sign-in policy to the authentication realms that you choose. The system presents this list of realms to the user or administrator when he signs-in to a device and allows him to choose a realm from the list. (Note that the system does not display a drop-down list of authentication realms if the URL is only mapped to one realm. Instead, it automatically uses the realm you specify.)
11. To move **Available realms** to **Selected realms** use the arrows. Similarly use arrows to move vice versa.
12. Under **Configure Sign-in Notifications**, select the check box for **Pre-Auth Sign-in Notification**, **Post-Auth Sign-in Notification**, or both.
 - After Pre-Auth Sign-in Notification, select a previously configured sign-in notification from the drop-down menu.
 - After Post-Auth Sign-in Notification, select the option for Use a common Sign-in Notification for all roles or Use the Sign-in Notification associated to the assigned role.
13. Click **Save Changes**.

Defining Authorization-Only Access Policies

Authorization-only access is similar to a reverse proxy. Typically, a reverse proxy is a proxy server that is installed in front of web servers. All connections coming from the Internet addressed to one of the web servers are routed through the proxy server, which may either deal with the request itself or pass the request wholly or partially to the main web server.

With an authorization-only access, you select a user role. The system then acts as reverse proxy server and performs authorization against the server for each request.

For example, the authorization-only access feature satisfies the following business needs:

- If you have a third-party AAA policy management server, the system acts as an authorization-only agent.
- If your user sessions are managed by a third-party session management system, there is no need to duplicate the user session management in the system.

With authorization-only access, there is no SSO from the system. SSO is controlled by your third-party AAA infrastructure.

To create or configure authorization-only access policies:

1. In the admin console, choose **Authentication > Signing In > Sign-in Policies**.
2. To create a new authorization only access policy, click '+' and select authorization only access. Or, to edit an existing policy, click a URL in the Virtual Hostname column.
3. In the **Virtual Hostname** field, enter the name that maps to the system's IP address. The name must be unique among all virtual hostnames used in pass-through proxy's hostname mode. The hostname is used to access backend application entered in the Backend URL field. Do not include the protocol (for example, http:) in this field.

For example, if the virtual hostname is myapp.ivehostname.com, and the backend URL is http://www.example.com:8080/, a request to https://myapp.ivehostname.com/test1 via the system is converted to a request to http://www.example.com:8080/test1. The response of the converted request is sent to the original requesting web browser.

4. In the **Backend URL** field, enter the URL for the remote server. You must specify the protocol, hostname and port of the server. For example, (*http://www.mydomain.com:8080/*)*.

When requests match the hostname in the Virtual Hostname field, the request is transformed to the URL specified in the Backend URL field. The client is directed to the backend URL unaware of the redirect.

6. Select a user role from the Role Option drop-down menu. Only the following user role options are applicable for authorization-only access.
 - Allow browsing un-trusted SSL web sites (Users > User Roles > RoleName > Web > Options > View advanced options)
 - HTTP Connection Timeout (Users > User Roles > RoleName > Web > Options > View advanced options)
 - Source IP restrictions (Users > User Roles > RoleName > General > Restrictions)
 - Browser restrictions (Users > User Roles > RoleName > General > Restrictions)

Ensure the user role you select has an associated Web Access policy.

7. Select the **Allow ActiveSync Traffic only** option to perform a basic of validation of the HTTP header to ensure the request is consistent with ActiveSync protocol. If you select this option only ActiveSync protocol requests can be processed. If validation fails, a message is created in the user's event log. If you do not select this option, both ActiveSync and non-ActiveSync requests are processed.
8. Select the **Kerberos Constrained Delegation Label** option to configure a KCD policy for Active Sync. This would list the existing configured Constrained Delegation labels. Selecting any one of the valid Constrained Delegation labels would force to use KCD for the Exchange Active Sync traffic. Also, this option is applicable only for Active Sync traffic.

This option also has the following dependencies:

- Enforce client certificate requirement on virtual ports which are used for Active Sync.
- Appropriate CA certificate should be imported under Trusted Client CAs.
- The role configured to use for Active Sync should be configured to have Certificate Restrictions to Only allow users with a client-side certificate signed by Certification Authority to sign in.
- Appropriate Constrained Delegation policy should be configured. Please refer to the section "Constrained Delegation" under configuring SSO policies

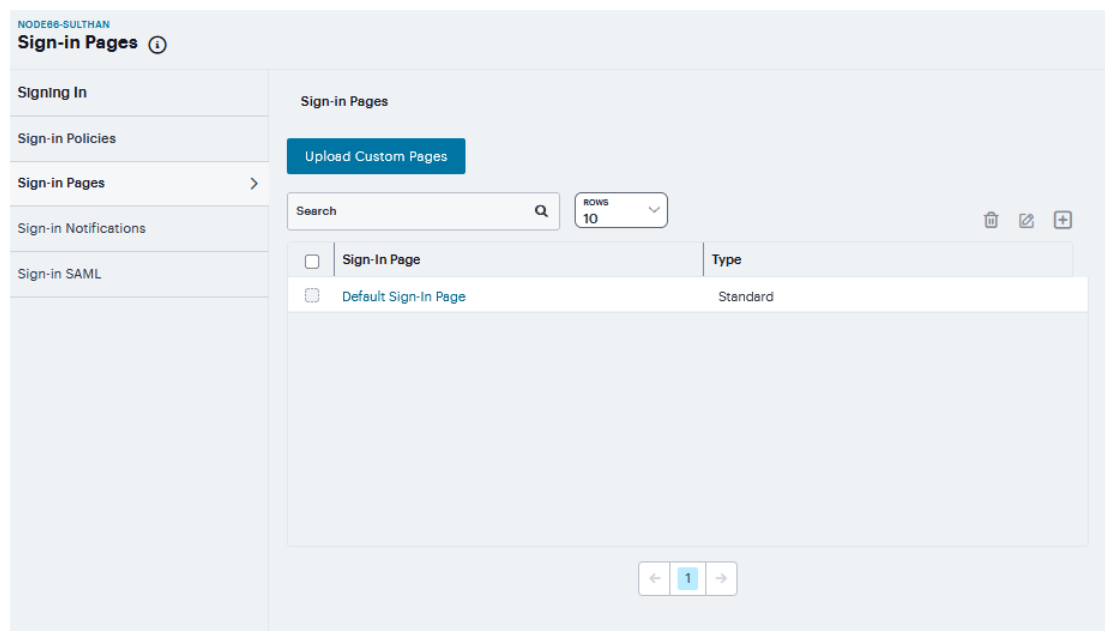

External configurations should be appropriately configured to support Constrained Delegation SSO; Exchange server should be configured to allow Kerberos authentication, i.e., Windows Authentication.

9. If Kerberos Constrained Delegation Label policy is chosen, enter the appropriate **Username Template** from certificate attributes.
10. Click **Save Changes**.

Configuring Sign-In Pages

A sign-in page defines the customized properties in the end-user's welcome page such as the welcome text, help text, logo, header, and footer. The system allows you to create two types of sign-in pages to present to users and administrators: * **Standard sign-in pages** - Standard sign-in pages are produced by Ivanti and are included with all versions of the Ivanti Connect Secure software. You can modify standard sign-in pages through the Authentication > Signing In > Sign-in Pages tab of the admin console. * **Customized sign-in pages** - Customized sign-in pages are THTML pages that you produce using the Template Toolkit and upload to the system in the form of an archived ZIP file. The customized sign-in pages feature enables you to use your own pages rather than having to modify the sign-in page included with the system.

Configuring Standard Sign-In Pages

Standard sign-in pages that come with the system include:

- Default Sign-In Page - the system displays this page to users when they sign into the device.

You can modify the default sign-in page that the system displays to users when they sign into the device. You can also create new standard sign-in pages that contain custom text, logo, colors, and error message text using settings in the Authentication > Signing In > Sign-in Pages tab of the admin console.

To create or modify a standard sign-in page:

1. In the admin console, select **Authentication > Signing In > Sign-in Pages**.
2. If you are:
 - Creating a new page, Click '+
 - Modifying an existing page, select the link corresponding to the page you want to modify.
3. Enter a **Name** to identify the page.

4. In the **Custom text** section, revise the default text used for the various screen labels as desired. When adding text to the **Instructions** field, note that you may format text and add links using the following HTML tags: `<i>`, ``, `
`, ``, and `<a href>`. However, the system does not rewrite links on the sign-in page (since the user has not yet authenticated), so you should only point to external sites. Links to sites behind a firewall will fail.

If you use unsupported HTML tags in your custom message, the system may display the end user's home page incorrectly.

Custom Sign-In Pages

Downloadable Zip Files

Although each zip file contains all the templates, each zip file is for a particular set of features:

- **Sample.zip** — This zip file is for standard IPS/ICS pages, including standard pre- and post-authentication pages, ACE pre-authentication pages, ACE pre-authentication pages for use with eTrust SiteMinder, and password management pages.
- **SoftID.zip** — This zip file is for use with the RSA Soft ID client.
- **Kiosk.zip** — This zip file is for use by kiosk users or for any system in which you want to lock out keyboard-based login.

To upload custom sign-in Pages into ICS:

1. Download new "**Sample Custom Page**" from new Admin UI after login as Admin.
(**Authentication > Sign-In Pages > Upload Custom Sign-In Pages**. Click on **Sample** It will download the Sample Folder as ZIP & save it on Local disk)
2. Copy the following files after unzip the folder (locally saved in previous step):
 - Logout.shtml
 - PleaseWait.shtml
3. Open pre-downloaded Sample Custom Sign-in folder as unzipped and replace all those files here.
4. Now select all the files and create (.ZIP) file to uploading custom sign-in page on latest build.
5. Log into ICS as admin which is running on latest build and follow the steps to upload new Custom Sign-In Page In new Admin UI Authentication > Sign-In Pages > Upload Custom Pages > Put the **Name** of Custom Sign-In Page > Click **Template file** field and select previously saved (.ZIP) file from local storage in step 4.
6. Select **Use Custom Page for the Ivanti Desktop Client Logon** check box will open a web browser and use custom pages for authentication instead of standard login prompts.
7. Select **Prompt the secondary credentials on the second page** check box to specifies a secondary authentication server that requires user input.
8. Now click on **Upload Custom Pages**. After successful upload, click **Save Changes**.
9. Once all the above steps are successful, we can see the new sign-in page added under Authentication -> Sign-In Pages.

10. Old variable names may change and new variables may be added. It is recommended that you convert old variable names to their new counterparts as the default values for the old variables may no longer exist. If you do not want to update your variable names, you can select the **Skip validation checks during upload** option in the Upload Custom Sign-In Pages page. If you select this option, you should review all your custom pages to ensure that they are still functioning correctly.

Upload Custom Sign-In Pages

Custom sign-in pages allow you to provide customized templates for various pages that may appear during the sign-in process. Refer to the documentation for information about creating valid templates.

Sample Templates Files
The following sample templates may be useful in producing your own customized sign-in page templates. Click to download the sample files, edit them to fit your needs, and then upload them.

- [SAMPLE](#)
This is a basic set of templates that works for most cases.
- [SOFTID](#)
This is a set of templates for ACE Authentication.
- [KIOSK EXAMPLE](#)
This is an example which demonstrates how to protect against hardware keystroke loggers.

Name

Upload Custom Pages

Sign-in Notifications

With sign-in notifications, you can create and configure detailed notification messages that appear for Ivanti Secure Access clients and for agentless access endpoints when the user attempts to sign in. For example, you could configure a notification message that explains terms of use, company-specific policies, a welcome page, an end user license agreement (EULA), or a message of the day (MOTD).

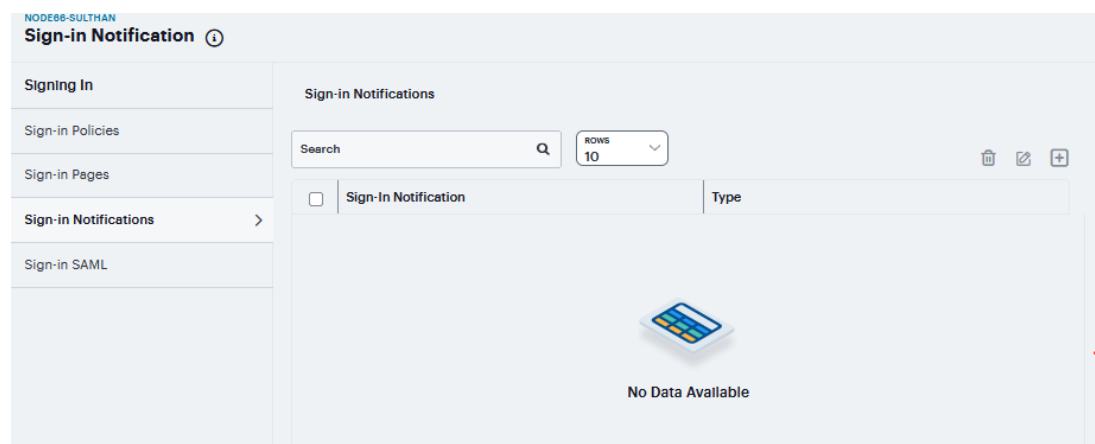

For a browser-based (agentless) login, the notification message appears in a separate page either before (pre-auth) or after (post-auth) user authentication during the sign-in process. For a Ivanti Secure Access client login, the notification messages appear in a Ivanti message box. The user is expected to read the content of the sign-in notification message and acknowledge by clicking a Proceed button. The user may indicate disagreement by clicking a Decline button, which ends the login attempt.

You can configure a sign-in policy to use a sign-in notification either as pre-auth or post-auth (or both). In the case of post-auth configuration, you can either use a common message for all roles or use separate messages for each role.

You can create a multi-language sign-in notification package that relies on the language setting of the endpoint. You can customize the sign-in notification page appearance for browser-based logins by modifying the related fields in a sign-in page in the Admin UI or by using a custom sign-in page.

- Sign-in notifications are supported on Windows, Mac, and for browser-based access on mobile devices. However, sign-in notifications might not work well with all mobile devices due to device limitations.
- Sign-in notifications (including uploaded packages) are included in XML exports.
- If a Ivanti session is resumed or extended, the pre-auth notification message is not shown again. However, if the user switches roles when resuming a session, and that role change results in a new notification, Ivanti displays the message. You can configure the post-auth message to be skipped if it has already been seen. If the post-auth message is not marked to be skipped, then it always appears.

Sign-in notifications appear for Ivanti Secure Access client and for browser-based logins when the user attempts to sign in.

To configure and implement sign-in notifications:

1. In the admin console, select **Authentication > Signing In > Sign-in Notifications**.
2. Click '+'. Specify a **Name** for the notification. This name appears in the sign-in policies page, and in the UI Options page for a selected role.

3. Select **Text** or **Package** in the Type box.

New Sign-In Notification ⓘ

NAME
New Sign-In Notification ⓘ

TYPE
Text ▼

TEXT (64 CHARACTER(S))
You are about to sign in to the system. Do you want to proceed? ⓘ

NOTE: For Pulse desktop L3 VPN connection, the combined length of all the sign-in notification messages cannot exceed 3000 characters. If it does then the notifications will be displayed to the user.

- If you select **Text**, type the desired sign-in notification message, or copy and paste the relevant text into the Text field.
- If you select **Package**, click the **Package** filed and navigate to a previously prepared .zip file. A package is typically used to provide different language versions of the notification message.
- The zip file should include a default.txt file and one or more <language>.txt files (Example: en.txt).
- Language-abbreviations should be strings that can appear in Accept-Language header of an HTTP request. For example:
 1. Upload a zip file containing files with name format: <language-abbreviation>.txt (Example: en.txt).
 2. Include 'default.txt' and one file for each language you want to support.
 3. Language-abbreviations should be strings that can appear in Accept-Language header of an HTTP request.
- The character encoding supported is UTF-8.

When you create a zip file, do not add the folder containing the files, but add the files directly.

- Click **Save Changes**.

Language abbreviations should be strings that can appear in Accept-Language header of an HTTP request. The character encoding supported is UTF-8.

Sign-in SAML

SAML is an XML-based framework for communicating user authentication, entitlement, and attribute information. The standard defines the XML-based assertions, protocols, bindings, and profiles used in communication between SAML entities. SAML is used primarily to implement Web browser single sign-on (SSO). SAML enables businesses to leverage an identity-based security system like Ivanti Connect Secure to enforce secure access to web sites and other resources without prompting the user with more than one authentication challenge.

SAML Metadata Provider

Sign-in SAML metadata provider settings determine how the system identity provider metadata is published. To configure the identity provider metadata publication settings:

- Select **Authentication > Signing In > Sign-In SAML > Metadata Provider** to display the configuration page.
- Complete the settings described in the following table.
- Click **Save Metadata Provider** to save your changes.

The following table lists the Sign-in SAML Metadata Provider Configuration Guidelines:

Sign-in SAML Metadata Provider

Setting	Guidelines
Entity ID	This value is prepopulated. It is generated by the system,

Setting	Guidelines
	based on the value for the Host FQDN for SAML setting on the System > Configuration > SAML > Settings page.
Metadata Validity	Specify the maximum duration for which a peer SAML entity can cache the system SAML metadata file. Valid values are 1 to 9999. The default is 365 days.
Do Not Publish SA Metadata	Select this option if you do not want the system to publish the metadata at the location specified by the system Entity ID field. You can use this option to toggle off publication without deleting your settings.
Download Metadata	Use this button to download the system SAML identity provider metadata.

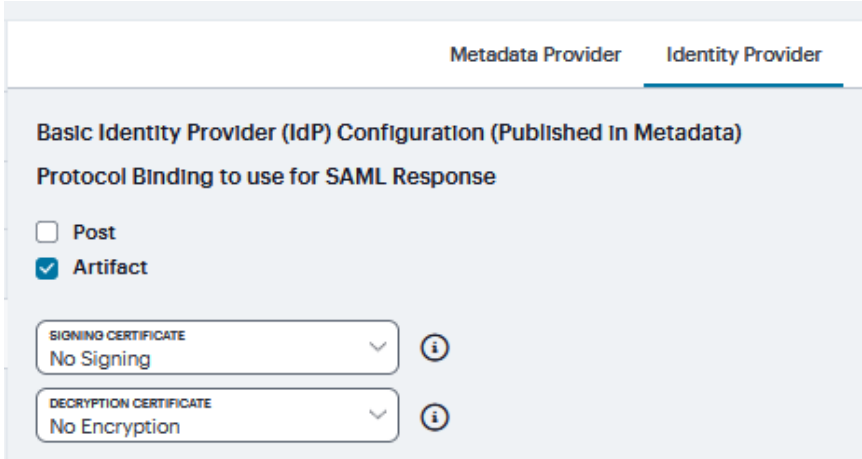

SAML Identity Provider

The settings defined in this procedure are the default settings for the system SAML identity provider communication with all SAML service providers. If necessary, you can use the peer service provider configuration to override these settings for particular service providers. To configure sign-in SAML identity provider settings:

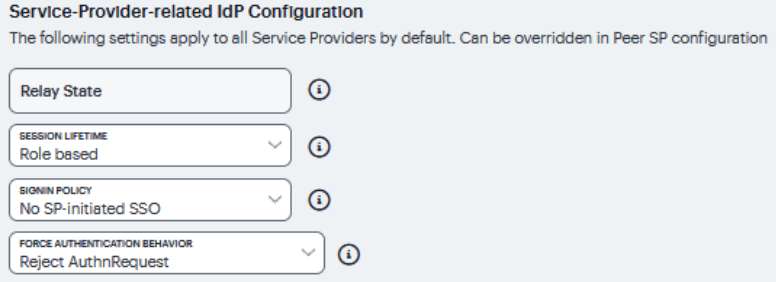

1. Select **Authentication > Signing In > Sign-In SAML > Identity Provider** to display the configuration page.
2. Complete the settings described in the following table.
3. Save the configuration.

The following table lists the Sign-in SAML Identity Provider Configuration Guidelines:

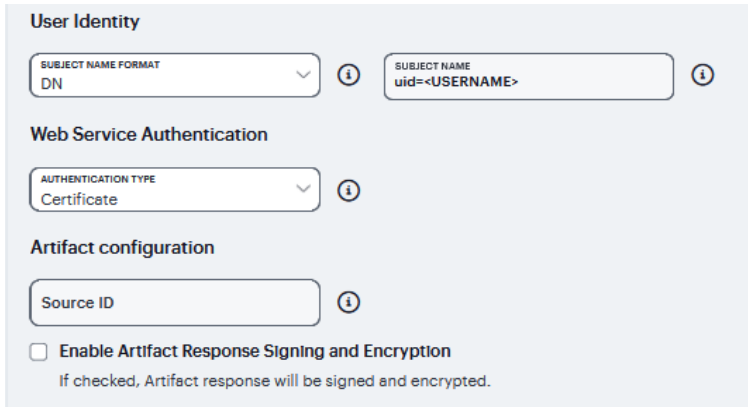

Sign-in SAML Identity Provider

Setting	Guidelines
Basic Identity Provider (IdP) Configuration (Published in Metadata)	
Protocol Binding to use for SAML Response	Select POST , Artifact , or both, depending on your total requirements.
Signing Certificate	Select the Certificate used to sign the SAML messages sent by the system. The certificates listed here are configured on the <i>System > Configuration > Certificate > Device Certificates</i> page.
Decryption Certificate	<p>Select the Certificate used to decrypt the SAML messages sent by peer service providers. The public key associated with this certificate is used by the peer service provider to encrypt SAML messages exchanged with this identity provider. The decryption certificate must be configured if the peer service provider encrypts the SAML messages sent to the system. The certificates listed here are configured on the <i>System > Configuration > Certificate > Device Certificates</i> page.</p> 
Other Configurations	Reuse Existing NC (Ivanti Secure) Session. This feature applies to a service-provider-initiated SSO scenario - that is, when a user clicks a link to log into the service provider site. The service provider redirects the user to the identity provider SSO Service URL.

Setting	Guidelines
	<p>If this option is selected, a user with an active NC/Ivanti Secure session is not prompted to authenticate. The system uses information from the existing session to form the SAML response.</p> <ul style="list-style-type: none"> • Accept unsigned AuthnRequest. In a service-provider-initiated SSO scenario, the SP sends an AuthnRequest to the identity provider. This AuthnRequest could be either signed or unsigned. If this option is unchecked, the system rejects unsigned AuthnRequests. Note that the system also rejects signed AuthnRequests if signature verification fails. • Sign SAML Assertion. If enabled, SAML assertion will also be signed along with signing the SAML response by default. Individual SPs can choose to accept only signed SAML assertion. • Signature Algorithm, select the algorithm from drop down. <div data-bbox="641 1024 1395 1480"> <p>Other Configurations</p> <p><input type="checkbox"/> Reuse Existing Pulse Session If enabled, the user's existing Pulse session if any will be used in the SP-initiated SSO scenario, instead of authenticating the user again. Can be disabled in Peer SP configuration.</p> <p><input type="checkbox"/> Reuse Existing IF-MAP Session If enabled, the user's existing IF-MAP session if any will be imported and used in the SP-initiated SSO scenario, instead of authenticating the user again. Can be disabled in Peer SP configuration. If both options are selected, the priority is given to "Reuse Existing Pulse Session".</p> <p><input type="checkbox"/> Accept unsigned AuthnRequest Individual SPs can choose to accept unsigned AuthnRequest.</p> <p><input type="checkbox"/> Sign SAML Assertion If enabled, SAML assertion will also be signed along with signing the SAML response by default. Individual SPs can choose to accept only signed SAML assertion.</p> <p>SIGNATURE ALGORITHM Sha-1 </p> </div>
Service-Provider-Related IdP Configuration	
Relay State	SAML Relay State attribute sent to the service provider in an identity-provider-initiated SSO scenario. If left blank, the RelayState value is the URL identifier of the resource being accessed.
Session Lifetime	Suggest a maximum duration of the session at the service provider created as a result of the SAML SSO. Select one of the following

Setting	Guidelines
	options: None. The identity provider does not suggest a session duration. Role Based. Suggest the value of the session lifetime configured for the user role. Customized. If you select this option, the user interface displays a text box in which you specify a maximum in minutes.
Sign-In Policy	Select the sign-in URL to which the user is redirected in a service-provider - initiated scenario. The list is populated by the sign-in pages configured on the Authentication > Signing In > Sign-in Policies page. The user is not redirected if he or she already has a session with the system and had authenticated through this sign-in policy.
Force Authentication Behavior	<p>In an service-provider-initiated scenario, the service provider sends an AuthnRequest to the identity provider. If the service provider AuthnRequest includes the ForceAuthn attribute set to true and the user has a valid session, this setting determines how the identity provider responds. Select one of the following options:</p> <ul style="list-style-type: none"> Reject AuthnRequest. Do not honor the SAML SSO request. Re-Authenticate User. Invalidate the user session and prompt for reauthentication. <p>This setting prevails over the Ivanti session reuse setting.</p> 
User Identity	
Subject Name Format	<p>Format of the NameIdentifier field in the generated assertion. Select one of the following options:</p> <ul style="list-style-type: none"> DN - Username in the format of DN (distinguished name).

Setting	Guidelines
	<ul style="list-style-type: none">• Email address - Username in the format of an e-mail address.• Windows - Username in the format of a Windows domain qualified username.• Other - Username in an unspecified format.
Subject Name	Template for generating the username that is sent as the value of the NameIdentifier field in the assertion. You may use any combination of available system or custom variables contained in angle brackets and plain text.
Web Service Authentication	These settings apply when the HTTP Artifact binding is used.
Authentication Type	Method used to authenticate the service provider assertion consumer service to the identity provider on the system. Select one of the following options: <ul style="list-style-type: none">• None - Do not authenticate the assertion consumer service.• Username/Password - If you select this option, use the controls to specify username and password settings.• Certificate - For certificate-based authentication, the Client CA of the service provider should be present in the system Trusted Client CA list (located on the <i>System > Configuration > Certificates > Trusted Client CAs</i> page).
Artifact Configuration	These settings apply when the HTTP Artifact binding is used.
Source ID	This is the Base64-encoded, 20-byte identifier of the Artifact Resolution Service on the identity provider.
Enable Artifact Response Signing and Encryption	If checked, the identity provider signs and encrypts the artifact response.

Setting	Guidelines
	 <p>The screenshot shows the configuration interface for a sign-in policy. It includes three main sections: 'User Identity' with a 'SUBJECT NAME FORMAT' dropdown set to 'DN' and a 'SUBJECT NAME' text box containing 'uid=<USERNAME>'; 'Web Service Authentication' with an 'AUTHENTICATION TYPE' dropdown set to 'Certificate'; and 'Artifact configuration' with a 'Source ID' text box. At the bottom, there is a checkbox for 'Enable Artifact Response Signing and Encryption' with a note: 'If checked, Artifact response will be signed and encrypted.'</p>
Attribute Statement Configuration	Attributes to be sent in SAML Attribute statements can be specified manually as name-value pairs, or you can configure an option to fetch name-value pairs from an LDAP server (or you can specify both manual entries and LDAP entries). Click '+' to add the attribute statements.
Attribute Name	An ASCII string.
Friendly Name	A more readable friendly name for the attribute. This is optional (an option included in the SAML standard).
Attribute Value	<p>The attribute value can be specified as a hard-coded string, a custom variable, or a user attribute variable. System conventions for specifying user and custom tokens and variables apply.</p> <ul style="list-style-type: none"> The value can be a combination of a string and a user or custom variable. For example: (Email::<customVar.email>.) The value can also be a combination of user and custom variables and hardcoded text. For example: (mydata=<USER> <REALM> <customVar.email>.)
Value Type	<p>Select Single-Valued or Multivalued.</p> <ul style="list-style-type: none"> A single-valued attribute can be a combination of a string and a user or custom variable.

Setting	Guidelines
	<ul style="list-style-type: none"> If there are multiple single-valued attributes configured with the same attribute names, they are combined and sent as a multivalued attribute. Select Multivalue if you want every individual token defined in the Attribute Value column to be sent as a separate AttributeValue. For example: <code><element ref="saml:AttributeValue" minOccurs="0" maxOccurs="unbounded"/></code> If the Attribute value is given as <code><USER>mars<REALM><orgname><ROLE></code> and the value type is marked as Multivalued, then the values sent as part of attribute statement are sent as follows: <ul style="list-style-type: none"> Username Realmname Role <p>Note that only the tokens ['<>'] will be considered when processing a Multivalued attribute marked. The remaining data (for example mars, jupiter) is discarded.</p> <p>Specifying the token <code><ROLE></code> will send only one role. To send all roles, specify the Attribute value with the syntax <code><ROLE SEP=","></code>. If you specify <code><ROLE SEP=","></code> as a single-valued attribute, it is sent as a single string with "," separated roles. If you specify <code><ROLE SEP=","></code> as a multi-valued attribute, each role is sent in a separate <code><AttributeValue></code> element. Encryption is set at the assertion level. You cannot encrypt individual attributes.</p>
Directory Server	<p>To fetch attribute name-value pairs from an LDAP server, complete the following settings:</p> <ul style="list-style-type: none"> Directory Server - Select the LDAP server from the list. You must add the LDAP server to the Authentication > Auth. Servers list before it can be selected.

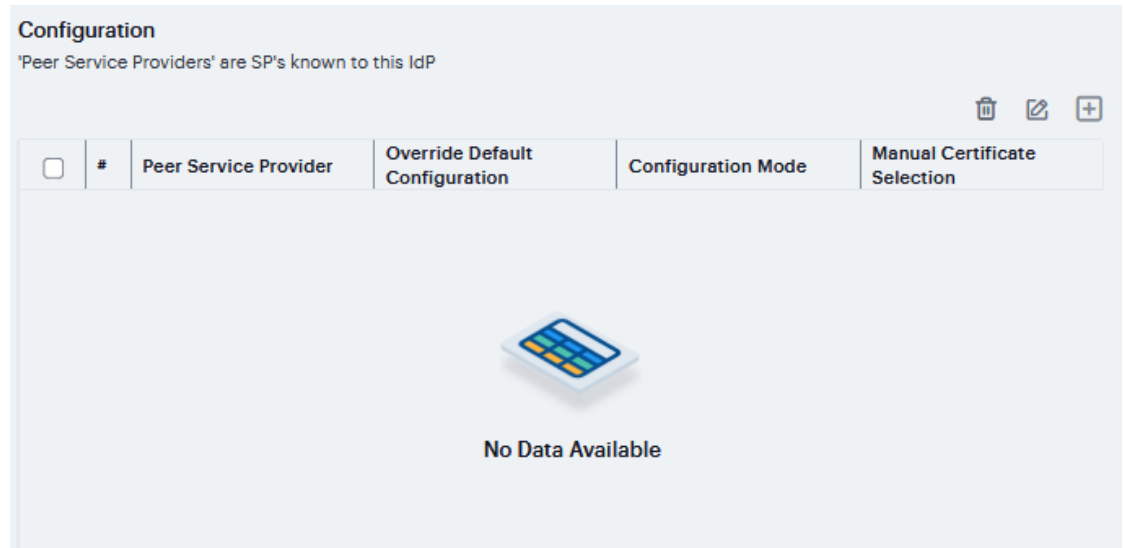

Setting	Guidelines
	<div><div><div><div>Attribute Statement Configuration</div><div>Attributes to be sent in SAML Attribute Statements can be configured as name-value pairs to the identity server.</div><div>Name-Value based configuration, here values can be system variables available in SSO panel.</div><div><div><div><input type="checkbox"/></div><div>#</div><div>Attribute Name</div><div>Friendly Name</div><div>Attribute Value</div></div><div><div>No Data Available</div></div></div></div><div><div>The value can contain textual characters as well as variables for substitution. Configuring Peer SAML Service Provider Settings

The peer service provider list defines the set of service providers configured to communicate with the system SAML identity provider. When you add a peer service provider to the list, you can customize the SAML identity provider settings used to communicate with the individual service provider. If the service provider provides a SAML metadata file, you can use it to simplify configuration, or you can complete more detailed manual steps. If available, we recommend you use metadata so that configuration is simpler and less prone to error.

To configure peer SAML service provider settings:

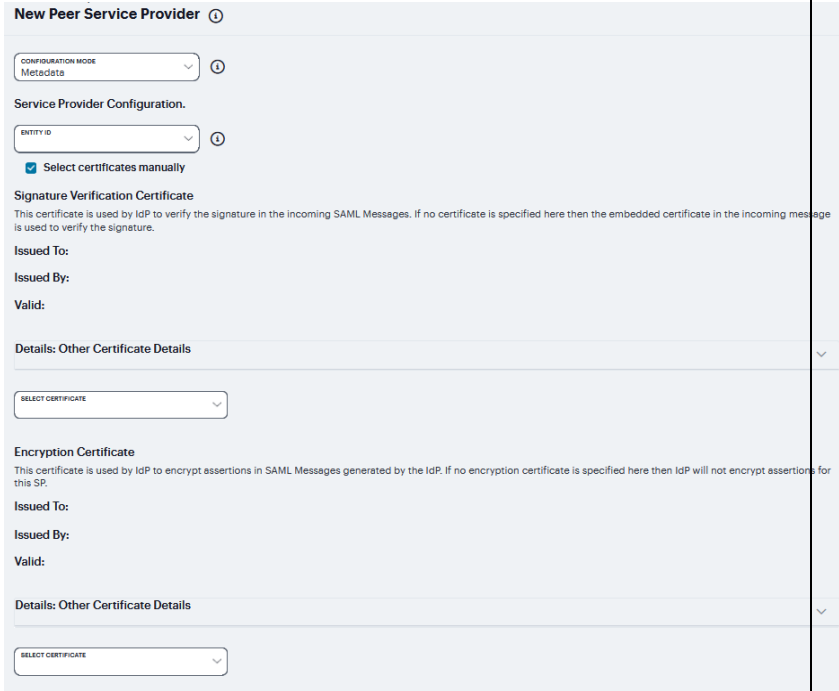

1. Select **Authentication > Signing In > Sign-In SAML > Identity Provider**.
2. Under **Peer Service Provider Configuration**, create a list of service providers that are SAML peers to the system **SAML identity provider**. To add a service provider to the list, click '+' to display the configuration page

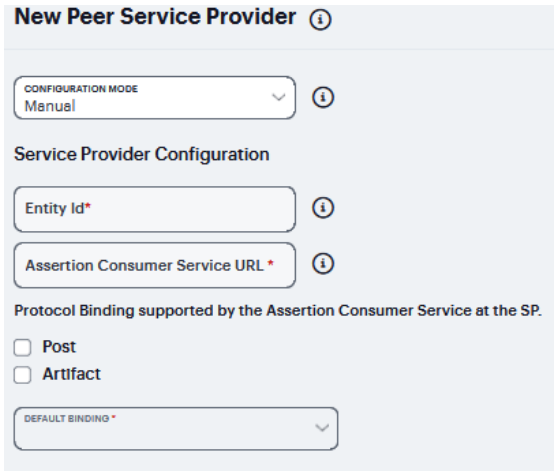

3. Complete the settings described in the following table.
4. Click **Save Changes**.

Sign-in SAML Identity Provider

Setting	Guidelines
Configuration Mode	Select Manual or Metadata.
Service Provider Configuration - Metadata	
Entity Id	If you use metadata, select the SAML entity ID of the service provider. This list contains all the service providers specified in all the metadata files added to the System > Configuration > SAML page.
Select certificates manually	When you use the metadata configuration, the system SAML identity provider iterates through all the signature verification certificates specified when verifying the incoming SAML messages coming from the service provider. Similarly, when encrypting the

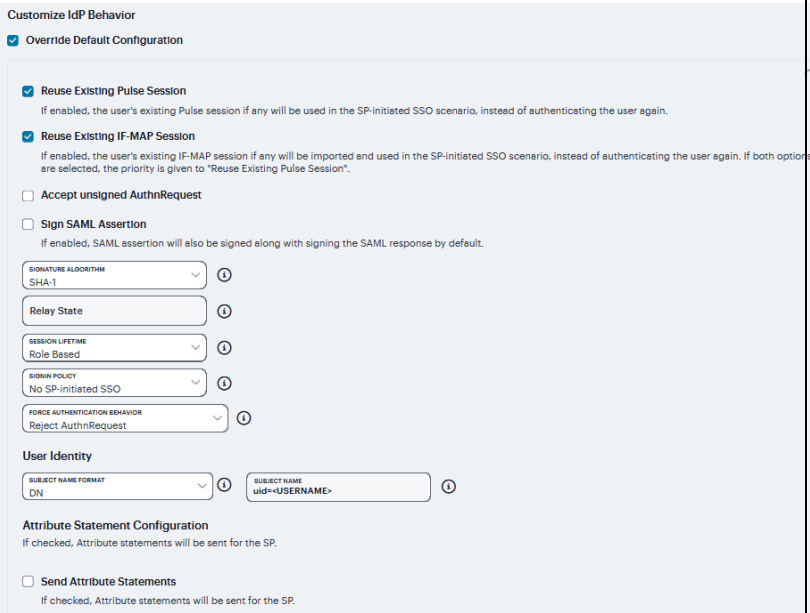

Setting	Guidelines
	SAML messages going out, the system SAML identity provider encrypts the messages with the first valid encryption certificate encountered in the metadata. Select this option to override this default behavior and select certificates manually.
Signature Verification Certificate	If you select the Select certificates manually option, select the certificate to be used by the identity provider to verify the signature of incoming SAML messages..
Encryption Certificate	<p>If you select the Select certificates manually option, select the certificate to be used if the assertions sent by the identity provider must be encrypted.</p> 
Service Provider Configuration - Manual	
Entity Id	If you are completing a manual configuration, ask the SAML service provider administrator for this setting.
Assertion Consumer Service URL	SAML service provider URL that receives the assertion or artifact sent by the identity provider.
Protocol	Select POST, Artifact, or both. This setting must be consistent with

Setting	Guidelines
Binding supported by the Assertion Consumer Service at the SP	the SAML identity provider configuration.
Default Binding	<p>If both POST and Artifact bindings are supported, which is the default? Post Artifact This setting must be consistent with the SAML identity provider configuration.</p> 
Signature Verification Certificate	Upload the certificate to be used by the identity provider to verify the signature of incoming SAML messages. If no certificate is specified, the certificate embedded in the incoming SAML message is used for signature verification.
Encryption Certificate	Upload the certificate to be used if the assertions sent by the identity provider must be encrypted. If not certificate is specified, the assertions sent by the identity provider are not encrypted.

Setting	Guidelines
	<div> <div> Signature Verification Certificate This certificate is used by IdP to verify the signature in the incoming SAML Messages. If no certificate is specified here then the embedded certificate in the incoming message is used to verify the signature. </div> <div> Issued To: Issued By: Valid: </div> <div> Details: Other Certificate Details </div> <div> <div> <div>UPLOAD CERTIFICATE</div> <div>No File Chosen</div> </div> <div>Delete</div> </div> <div> Encryption Certificate The certificate to use if the the assertions from this IdP need to be encrypted. </div> <div> Issued To: Issued By: Valid: </div> <div> Details: Other Certificate Details </div> <div> <div> <div>UPLOAD CERTIFICATE</div> <div>No File Chosen</div> </div> <div>Delete</div> </div> </div>
Certificate Status Checking Configuration	
Enable signature verification certificate status checking	Select this option to enable revocation checks for the signing certificate. Uses the configuration on the System > Configuration > Certificates > Trusted Client CAs page.
Enable encryption certificate status checking	Select this option to enable revocation checks for the encryption certificate. Uses the configuration on the System > Configuration > Certificates > Trusted Client CAs page.

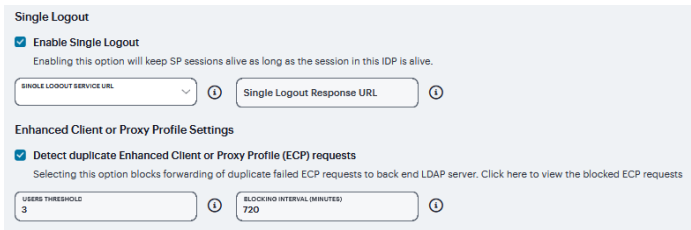

Setting	Guidelines
	<p>Certificate Status Checking Configuration</p> <p><input type="checkbox"/> Enable signature verification certificate status checking Check this to enable revocation checks for the signing certificate. (Uses configuration in Trusted Client CAs.)</p> <p><input type="checkbox"/> Enable encryption certificate status checking Check this to enable revocation checks for the Encryption certificate. (Uses configuration in Trusted Client CAs.)</p>
Customize identity provider Behavior	
Override Default Configuration	Select this option to set custom behavior of the system SAML identity provider for this SP instance. If you select this option, the user interface displays the additional options listed next.
Reuse Existing NC (Ivanti Secure) Session	This option cannot be enabled here if it is not selected for the sign-in SAML identity provider default settings.
Reuse Existing IF-MAP Session	If enabled, the user's existing IF-MAP session if any will be imported and used in the SP-initiated SSO scenario, instead of authenticating the user again. If both options are selected, the priority is given to "Reuse Existing Ivanti Secure Session".
Accept unsigned AuthnRequest	<p>Individual service providers can choose to accept unsigned AuthnRequest.</p> <ul style="list-style-type: none"> • Sign SAML Assertion. If enabled, SAML assertion will also be signed along with signing the SAML response by default. Individual SPs can choose to accept only signed SAML assertion. • Signature Algorithm, select the algorithm from drop down.
Relay State	SAML RelayState attribute sent to the service provider in an identity- provider-initiated SSO scenario. If left blank, the RelayState value is the URL identifier of the resource being accessed.
Session Lifetime	Suggest a maximum duration of the session at the service provider created as a result of the SAML SSO. Select one of the following

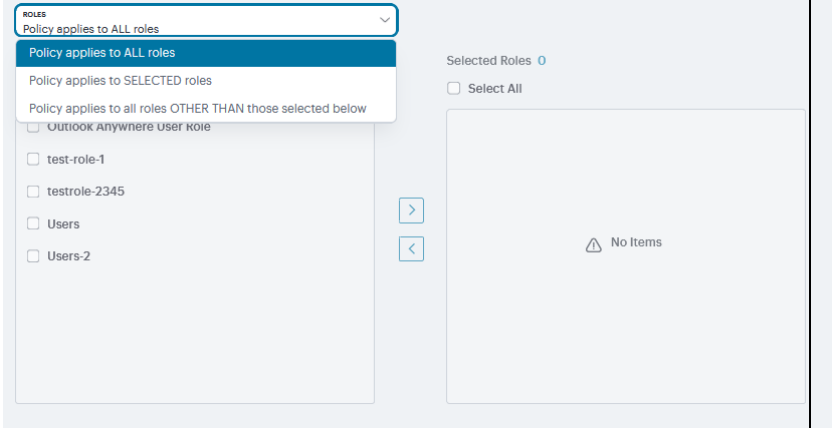

Setting	Guidelines
	options: None. The identity provider does not suggest a session duration. Role Based. Suggest the value of the session lifetime configured for the user role. Customized. If you select this option, the user interface displays a text box in which you specify a maximum in minutes.
Sign-In Policy	Select the sign-in URL to which the user is redirected in a service-provider - initiated scenario. The list is populated by the sign-in pages configured on the Authentication > Signing In > Sign-in Policies page. The user is not redirected if he or she already has a session with the system and had authenticated through this sign-in policy.
Force Authentication Behavior	<p>In an service-provider-initiated scenario, the service provider sends an AuthnRequest to the identity provider. If the service provider AuthnRequest includes the ForceAuthn attribute set to true and the user has a valid session, this setting determines how the identity provider responds. Select one of the following options:</p> <ul style="list-style-type: none">• Reject AuthnRequest. Do not honor the SAML SSO request.• Re-Authenticate User. Invalidate the user session and prompt for reauthentication. <p>This setting prevails over the Ivanti session reuse setting.</p>

Setting	Guidelines

Variables should be enclosed in angle brackets like this «variable».</p><p>Examples:</p><ul style="list-style-type: none"><USER> The user's login name<REALM> The user's sign-in realm<ROLE SEP> For a comma separated list of roles.<p>Mark an element as Multi-valued if it should be sent as a multi valued attribute, in this case multiple tokens in an attribute value will be sent as individual values</p><p>Directory server based configuration</p><div><div>DIRECTORY SERVER</div><div>None</div></div></div></div></div>

Setting	Guidelines
	<p>Specifying the token <ROLE> will send only one role. To send all roles, specify the Attribute value with the syntax <ROLE SEP=",">. If you specify <ROLE SEP=","> as a single-valued attribute, it is sent as a single string with "," separated roles. If you specify <ROLE SEP=","> as a multi-valued attribute, each role is sent in a separate <AttributeValue> element. Encryption is set at the assertion level. You cannot encrypt individual attributes.</p>
Directory Server	<p>To fetch attribute name-value pairs from an LDAP server, complete the following settings:</p> <ul style="list-style-type: none"> • Directory Server - Select the LDAP server from the list. You must add the LDAP server to the Authentication > Auth. Servers list before it can be selected.
Single Logout	<p>Single logout is a mechanism provided by SAML for logging out a particular user from all the sessions created by the identity provider. Select this option if the system must receive and send a single logout request for the peer SAML identity provider.</p>
Enable Single Logout	<p>* If you use the metadata option, the Single Logout Service URL setting can be completed by selecting the SLO service URL from the list. The list is populated by the identity provider entities defined in metadata files added to the System > Configuration > SAML page. The system sends Single Logout requests to this URL. * In addition, if you use the metadata option, the Single Logout Response URL setting is completed based on your selection for Single Logout Service URL. If the identity provider has left this setting empty in its metadata file, the system sends the Single Logout response to the SLO service URL. If you complete these settings manually, ask the SAML identity provider administrator for guidance.</p> 
Enhanced Client or Proxy Profile	<p>Select Detect duplicate Enhanced Client or Proxy Profile (ECP) requests option to block forwarding of duplicate failed ECP requests to back end LDAP server.</p>

Setting	Guidelines
Settings	
Users Threshold	Number of duplicate ECP requests that can be detected and blocked per user
Blocking Interval	In Minutes
Roles	<p>Select one of the following options:</p> <ul style="list-style-type: none"> • Policy applies to ALL roles. To apply this policy to all users. • Policy applies to SELECTED roles. To apply this policy only to users who are mapped to roles in the Selected roles list. Make sure to add roles to this list from the Available roles list. • Policy applies to all roles OTHER THAN those selected below. To apply this policy to all users except for those who map to the roles in the Selected roles list. Make sure to add roles to this list from the Available roles list. 

Using Endpoint Security

- ["Managing ESAP Versions" below](#)
- ["Configuring Host Checker Policy" on page 357](#)

Managing ESAP Versions

The Endpoint Security Assessment Plug-in (ESAP) on Ivanti Connect Secure checks third-party applications on endpoints for compliance with the predefined rules you configure in a Host Checker policy. This plug-in is included in the system software package.

Ivanti frequently adds enhancements, bug fixes, and support for new third-party applications to the plug-in. New plug-in releases are available independently and more frequently than new releases of the system software package. If necessary, you can upgrade the plug-in independently of upgrading the system software package.

You can upload up to four versions of the plug-in to your system, but it uses only one version at a time (called the active version). If necessary, you can roll back to a previously active version of the plug-in.

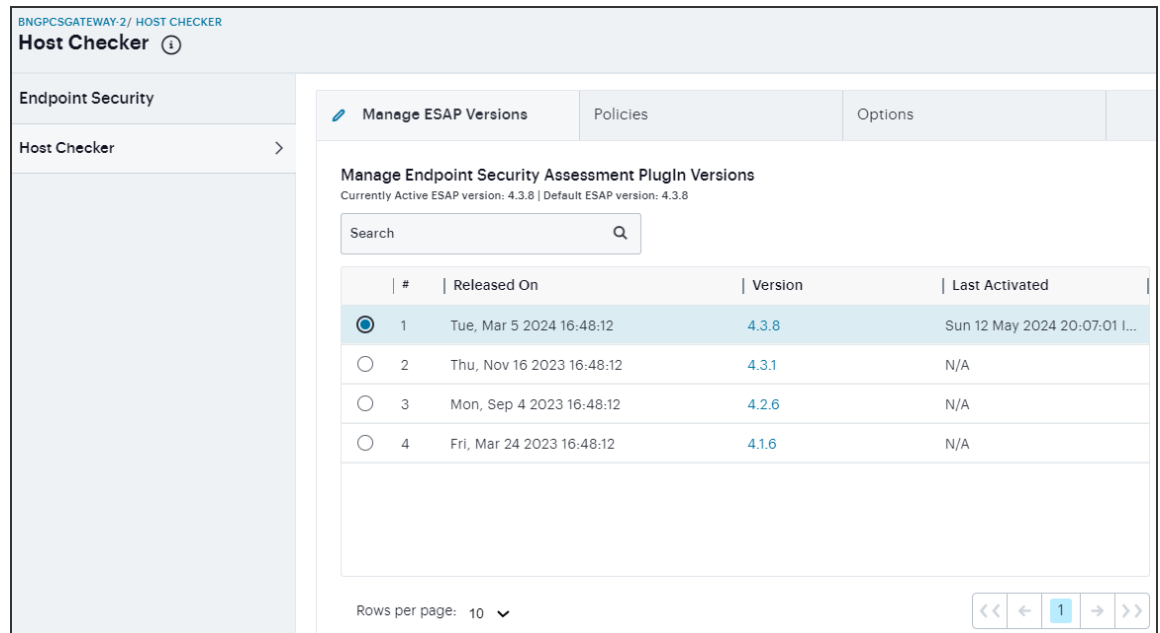

The default SDK version used is v3, but it can be reconfigured based on your requirement. The product/vendor names used by v3 and v4 SDK might differ. Due to the product/vendor names mismatch, there is a possibility that the rules become empty while creating Host Checker rule with v3 SDK activated and upon enabling v4 SDK. To avoid this, a migration page is added to help the administrators in migrating the policies from v3 to v4 SDK.

To migrate from v3 to v4 version:

1. Navigate to **Manage Endpoint Security Assessment PlugIn Versions** section on the **Authentication > Endpoint Security > Host Checker** page.
2. Select the **Enable migration of Opswat SDK from old to new version (V3 to V4)** option.

- Click **Save Changes**.

On enabling this option, the clients start downloading the V4 SDK and migrate to newer SDK.

- Clear the Enable migration of Opswat SDK from old to new version (V3 to V4) option once the migration is complete.
- Verify the migration status. In the confirmation message box, click Confirm.

To roll back to previous version of OPSWAT SDK:

- Navigate to **Manage Endpoint Security Assessment PlugIn Versions** section on **Authentication > Endpoint Security > Host Checker** page.
- Clear the **Enable migration of Opswat SDK from old to new version (V3 to V4)** check box.
- Enable **Activate Older Opswat SDK in ESAP for Host Checker policy evaluation**.
- Click **Save Changes**.

Enabling the Active ESAP Package

Administrator can enable "Enable Active ESAP package on the client" check box to ensure that client machine always uses the active ESAP package, even if the active ESAP package is older than the version installed on the client system. In case client machine has newer ESAP package installed, it will be replaced with the older Active ESAP version with this option enabled.

To enable the active ESAP package:

1. Select **Authentication > Endpoint Security > Host Checker**.
2. Under Manage Endpoint Security Assessment Plugin Versions, select the **Enable Active ESAP package on the client** check box.
3. Click **Save Changes**.

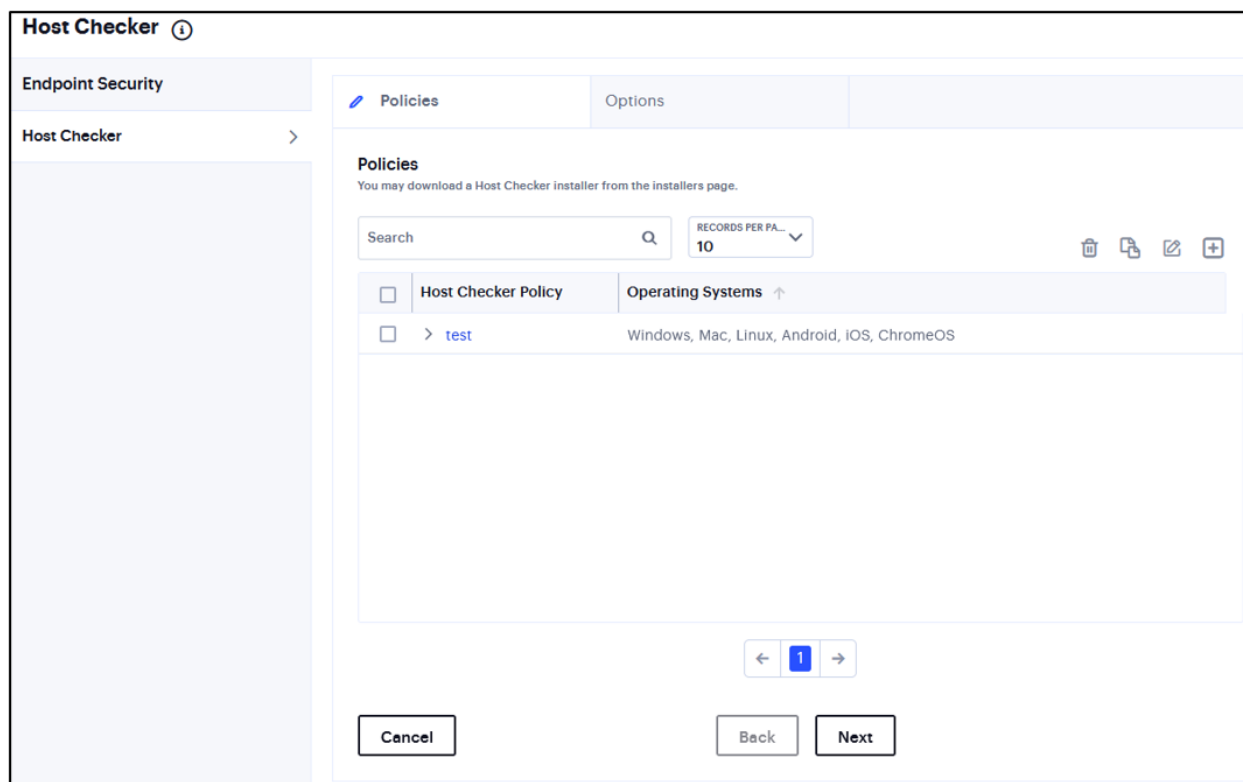

Configuring Host Checker Policy

Host Checker is a software component that performs endpoint compliance checks on hosts that connect to Ivanti Connect Secure. It supports two types of rules within a policy; predefined and custom. The pre-defined inspection capabilities consist of health and security checks including antivirus versions, antispysware, OS versions, hard disk encryption status and patch checks. The pre-defined rules are provided by OPSWAT and it uses the ESAP plug-in for pre-defined checks.

To configure a Host Checker policy, perform these tasks:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click **Gateways > Gateways List**. In the Gateways list page, select the standalone ICS Gateway or Cluster node that you want to configure.

- From the ICS menu, select **Authentication > Endpoint Security > Host Checker**.

- Under Policies, click the '+' icon.
- Enter a name for the policy and then click **Save Changes**.

A list of all the added policies is displayed.

6. Create one or more rules to associate with the policy.

In the **Options** tab, enter time limit for performance check and logout time if the device is inactive.

Checking for Third-Party Applications Using Predefined Rules

Host Checker comes pre-equipped with a vast array of predefined rules that check for antivirus software, firewalls, malware, spyware, and specific operating systems from a wide variety of industry leaders. You can enable one or more of these rules within a Host Checker client-side policy to ensure that the integrated third-party applications that you specify are running on your users' computers in accordance with your specifications. For firewall and antivirus rules, you can specify remediation actions to automatically bring the endpoint into compliance.

Add Rule: Antivirus Rule with Remediation Options

To configure a Predefined Antivirus rule:

1. Select one of the following supported platforms:
 - Windows
 - Mac
2. Enter a Rule Name.
3. Under Criteria, click **Require specific products/vendors**. A new window will open with a list of all of the products that support the feature.
4. Select your vendor(s) and product(s) by using either the **Require any supported product from a specific vendor** or **Require specific products** check box.
5. If your product is supported, select the check box for any or all of the remediation actions that you want to apply.
6. (Optional) Select or clear the check box next to **Successful System Scan must have been performed in the last**, and enter the number of days in the field.
 - If you select this check box, a new option appears. If the remediation action to start an antivirus scan has been successfully begun, you can override the previous check.
7. (Optional) Select or clear the check box next to **Check for the Virus Definition files**. Enter a number between 1 and 20. If you enter 1, the client must have the latest update.

8. (Optional) Select **Monitor this rule for change in result** to continuously monitor the policy compliance of endpoints.

Specifying Customized Requirements Using Custom Rules

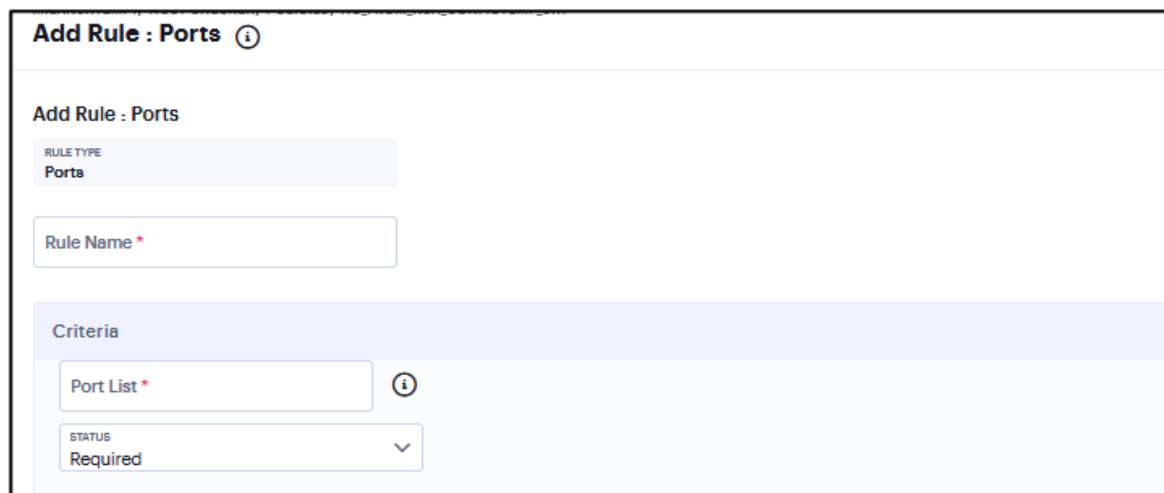

In addition to the predefined policies and rules that come with the system, you can create custom rules within a Host Checker policy to define requirements that your users' computers must meet.

Add Rule: Ports

Use this rule type to control the network connections that a client can generate during a session. This rule type ensures that certain ports are open or closed on the client machine before the user can access the device.

To configure the Ports rule:

1. Select one of the following supported platform options:
 - Windows
 - Mac
 - Linux
2. Enter the rule name.
3. Under Criteria, enter the Port list.
4. Click Status and select Required/Deny.
 - Required: Select this to enable access from a listed port.
 - Deny: Select this to disallow access from a listed port.

The screenshot shows the 'Add Rule : Ports' configuration form. At the top, there is a title 'Add Rule : Ports' with an information icon. Below the title, the 'RULE TYPE' is set to 'Ports'. A text input field for 'Rule Name *' is present. Under the 'Criteria' section, there is a 'Port List *' text input field with an information icon. Below that, the 'STATUS' is set to 'Required' with a dropdown arrow.

Add Rule: Process

To configure the Process rule:

1. Select one of the following supported platform options:
 - Windows
 - Mac
 - Linux
2. Enter the rule name.
3. Under Criteria, enter the Process name. For example, explorer.exe.
4. Click **Status** and select **Required/Deny**.
 - Required: Select this to allow access if the process exists.
 - Deny: Select this to deny access if the process does not exist.
5. (Optional) Enter the MD5 Checksums/SHA256 Checksums.

6. Select Monitor this rule for change in result to check if there is any change in compliance result.

Enabling this option will report change in compliance for this rule to the Pulse Connect Secure immediately. The client component requires additional computing cycles to report change in compliance immediately. We strongly recommend that this option be enabled for rules that are dynamic in nature , for example a rule for RTP check provided by AntiVirus software. For other rules the host checker update frequency should be used to get periodic health checks from endpoints

Add Rule: File

To configure the File rule:

1. Select one of the following supported platform options:
 - Windows
 - Mac
 - Linux
2. Enter the rule name.
3. Enter a full file name and path in File Name. For example, "c:test.txt" or "/Users/exampleuser/Downloads/test.txt".

4. Under Criteria, click **Status** and select **Required/Deny**.
 - Required: Select this to allow access where the file exists and is valid.
 - Deny: Select this to deny access if the file does not exist or is invalid.
5. (Optional) Enter the MD5 Checksums/SHA256 Checksums value for the file.
6. Select Monitor this rule for change in result to check if there is any change in compliance result.

Configuring User Realm

The user realm configuration associates the authentication server data and MDM server data with user roles.

To configure user realm:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the **Gateway > Gateway List** and then select any standalone ICS Gateway and Cluster node.
3. Navigate to **Users > User Realms**.

A list of user realms is displayed. Use the Search bar at the top to filter the results list. For each column, click the arrow icon adjacent to the column name to sort in ascending or descending order.

4. In the User Realms page, click the Add icon.

Save Changes

1. Enter a name and description for the realm.
2. Under Servers, select the user authentication server for this realm's users.

3. If you want to use dynamic policy evaluation for this realm, select **Dynamic policy evaluation** to enable an automatic timer for dynamic policy evaluation of this realm's authentication policy, role mapping rules, and role restrictions:
 - Use the **Refresh interval** option to specify how often you want Connect Secure to perform an automatic policy evaluation of all currently signed-in realm users.
 - Select **Refresh roles** to also refresh the roles of all users in this realm.
 - Select **Refresh resource policies** to also refresh the resource policies for all users in this realm.
 - Click **Refresh Now** to manually evaluate the realm's authentication policy, role mapping rules, role restrictions, user roles, and resource policies of all currently signed-in realm users.
4. Click **Save Changes** to create the realm.

Configuring User Role

A user role is an entity that defines user session parameters, personalization settings, and enabled access features. You can customize a user role by enabling specific access features, defining Web, application, and session bookmarks, and configuring session settings for the enabled access features.

To add a new user role:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the **Gateway > Gateway List** and then select any standalone ICS Gateway and Cluster node.
3. Navigate to **Users > User Roles**.

A list of user roles is displayed. Use the Search bar at the top to filter the results list. For each column, click the arrow icon adjacent to the column name to sort in ascending or descending order.

4. In the User Roles page, click the Add icon.

5. Enter a name and optionally a description.

6. Under Options:

- Select the **VLAN/Source IP** option to apply the role settings configured on the General > VLAN/Source IP page.
- Select the **Session Options** option to apply the role settings in the General > Session Options page to the role.
- Select the **UI Options** option to apply the role settings in the General > UI Options page to the role.

7. Under Access features, select the features you want to enable for the role. Options include:

- Web - intermediate Web URLs through the Content Intermediation Engine.
- Files, Windows - resource profile that controls access to resources on Windows server shares.
- Secure Application Manager (Windows version or Java version) - provides secure, application-level remote access to enterprise servers from client applications.
- Terminal Services - enable terminal emulation sessions on a Windows terminal server, Citrix NFuse server, or Citrix Metaframe server.
- Virtual Desktops - enable virtual desktop session using the VDI architecture.
- HTML5 Access - enable HTML5 session for RDP connection, telnet connection, SSH session or VNC connection.
- VPN Tunneling - provides secure, SSL-based network-level remote access to all enterprise application resources using the system.
- Secure Mail - enables automatic synchronization with an Exchange server (ActiveSync) and e-mail encryption for iOS devices that have the Ivanti Secure Access Client.

8. Click **Save Changes** to apply the settings to the role.

Resource Profiles

A resource profile contains all of the resource policies, role assignments, and end-user bookmarks required to provide access to an individual resource. Resource profiles simplify resource configuration by consolidating the relevant settings for an individual resource into a single page within the admin console.

The system comes with two types of resource profiles:

- Standard resource profiles enable you to configure settings for a variety of resource types, such as web sites, client/server applications, directory servers, and terminal servers. When you use this method, you choose a profile type that corresponds to your individual resource and then provide details about the resource.
- Resource profile templates enable you to configure settings for specific applications. When you use this method, you choose a specific application (such as the Citrix NFuse version 4.0). Then, the system pre-populates a variety of values for you based on your chosen application and prompts you to configure additional settings as necessary.

Resource profiles are an integral part of the access management framework, and therefore are available on all Ivanti Connect Secure products. However, you can only access resource profile types that correspond to your licensed features.

Resource Profiles ⓘ

Resource profiles specify sets of resources, create bookmarks to them, and define which user roles can and cannot access the resources. Resource profiles also include rules that fine-tune who can access the resources and specify additional actions that the IVE must take.

Web ⓘ
Web resource profiles enable/disable access to web resources such as Intranet or Internet pages.

Files ⓘ
File resource profiles enable/disable access to network file systems and directories.

Terminal Services ⓘ
Terminal Services resource profiles enable/disable access to Windows and Citrix terminal servers.

Virtual Desktops ⓘ
Virtual Desktops resource profiles enable/disable access to VMware and Citrix Virtual Environments.

HTML5 Access ⓘ
HTML5 Access profiles enable/disable clientless access to terminal servers using RDP/SSH/Telnet protocols.

Web Resource Profile

To Create new Web Application Resource Profiles:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the **Gateway > Gateway List** and then select any standalone ICS Gateway and Cluster node.
3. Navigate to **Users > Resource Profiles > Web**.

A list of resource profiles is displayed. Use the Search bar at the top to filter the results list. For each column, click the arrow icon adjacent to the column name to sort in ascending or descending order.

4. Click '+' and select the Profile Template from drop down.

The screenshot shows the 'Web Application Resource Profiles' page. At the top, there's a search bar and a 'RECORDS PER PAGE' dropdown set to 10. Below this is a table with the following columns: a checkbox, an ID column, a 'Resource Profile' column, a 'Bookmarks' column, a 'Roles' column, a 'Supporting Policies' column, and an actions column with a plus icon. One row is displayed with ID '1', Resource Profile 'testweb' (with URL 'http://10.96.158.95/test1.txt' below it), Bookmarks 'testweb', Roles 'Users, Users-2', and Supporting Policies 'Web ACL'.

<input type="checkbox"/>	#	Resource Profile	Bookmarks	Roles	Supporting Policies	
<input type="checkbox"/>	1	testweb http://10.96.158.95/test1.txt	testweb	Users, Users-2	Web ACL	...

5. Enter a unique **Name** and optionally a **Description** for the profile.

Citrix Storefront Server

If you have the Citrix StoreFront 31. and above, you can create a Web template to allow users to access Citrix applications without the need for a Citrix client. Users must have one of the following browser versions (or later) to support HTML5 and Websockets:

- Internet Explorer 10
- Safari 6
- Google Chrome 23
- Mozilla Firefox 17

If **Citrix resource profile** selected as Profile Template, then

1. Enter the URL of the **Citrix StoreFront Web** server in the **Base URL** field. Use the format: [protocol://]host[:port][/path]. The system uses the specified URL to define the default bookmark for the Citrix resource profile.

- Under **Citrix Settings**, select the **ICA Client Access** option. Admin can either choose to go with the HTML5 way of delivery or can choose to deliver ICA over CTS/PSAM/HTML5 Access clients. If admin chooses the ICA over CTS/PSAM/HTML5 Access, the corresponding ACL should be created and when ICS rewrites ICA content it should launch the appropriate client. Add the Number of servers/applications and Citrix Ports which require ICA client access.

Hosted Java Applet

The Java applet upload feature enables you to store the Java applets of your choice directly on the device without employing a separate Web server to host them. When you use this feature, you simply upload the applets to the device (along with additional files that the applets reference) and create a simple Web page through the system that references the files. Then, the system intermediates the Web page and Java applet content using its Content Intermediation Engine.

For example, you might want to use the system to intermediate traffic between an IBM AS/400 system on your network and individual 5250 terminal emulators on your users' computers. To configure the system to intermediate this traffic, obtain the 5250 terminal emulator's Java applet. Then you can upload this applet to the system and create a simple Web page that references the applet. After you create the Web page through the system, it creates a corresponding bookmark that users can access through their home pages.

If **Hosted Java applet** is selected as Profile Template, then

1. Select the Java applet that you want to associate with the resource profile from the **Applet to use** list. Or, if the applet that you want to use is not currently available in the list, click **Edit list**.

1. Click '+' to add an applet to this list.

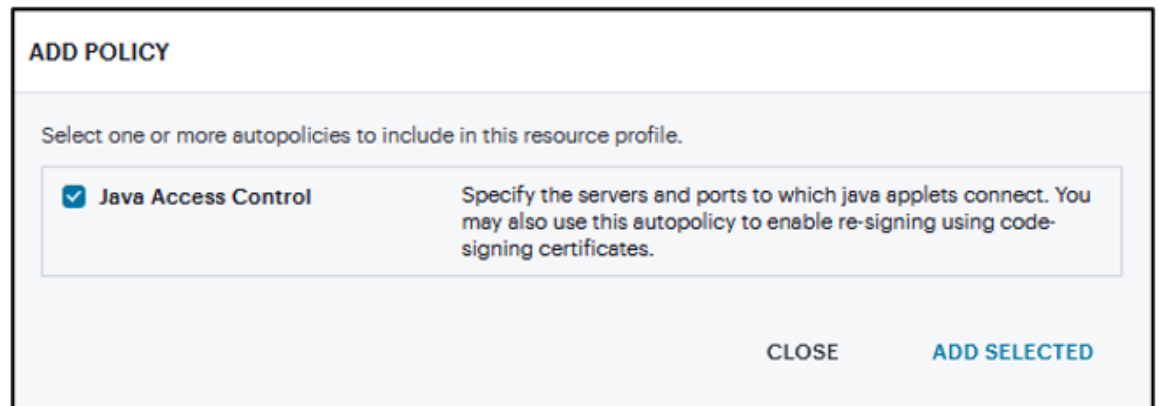

If you replace an existing archive, make sure that the new applet archive contains all of the necessary files for the applet to successfully launch and run. If the associated HTML for the applet refers to files that do not exist in the new archive, then the applet will not function correctly.

2. Enter **Name** to identify the applet.
3. Click the text field to browse to the applet that you want to upload.
4. Select the **Uncompress archive file** check box if the file that you selected is an archive that contains the applet. Click **OK**.

When you select an applet in the Java Applets dialog box, you are loading third-party software onto the Ivanti product. By clicking OK, you are agreeing to the following terms on behalf of yourself (as purchaser of the equipment) or the organization that purchased the Ivanti product, as applicable.

2. Click **Add Autopolicy**, select **Java Access Control to enable access** if your Java applets need to make socket connections.

- Click '+' specific **Resource** under the Base URL. Enter the full URL of the resource, select **Allow** or **Deny**, and click **Save Changes**.

- Select the **Sign applets with uploaded code-signing certificate(s)** to use a single code-signing certificate to resign all Java applets.
- Click **Save Changes**.

Microsoft RDWeb

A Microsoft RDWeb template is a resource profile that controls access to the published desktops and applications based on HTML5. Microsoft RDWeb templates significantly reduce the configuration time by consolidating configuration settings into one place and by pre-populating a variety of resource policy settings.

If **Microsoft RDWeb** resource profile selected as Profile Template, then

- Enter the URL of the Microsoft RDWeb server in the **Base URL** field.
- Click **Add Autopolicy, Web Access Control** check box to create a policy and click **Add Selected**.

- Under **Web Access Control**, click '+' specific **Resource** under the Base URL. Enter the full URL of the resource, select **Allow** or **Deny**, and click **Save Changes**.

Microsoft OWA Versions

A Microsoft Outlook Web Access (OWA) template is a resource profile that controls access to the application and configures OWA settings as necessary. OWA templates significantly reduce your configuration time by consolidating configuration settings into one place and by prepopulating a variety of resource policy settings for you depending on the type of setup you select. The system supports intermediating traffic to Microsoft OWA through a Web rewriting resource profile template, JSAM, PSAM, and VPN Tunneling. This topic describes how to configure access using the Web rewriting template. The prepopulated values vary depending on the version of OWA you select and are based on the most common deployment of the servers.

If any of the **Microsoft OWA** Versions are selected as Profile Template, then

1. Enter the URL of the OWA resource to which you want to control access In the **Base URL** box.
2. Under **OWA settings**, select **Security Settings** and Select **Prevent download of attachments** to prohibit users from downloading attachments to their systems.

3. Select **Prevent upload of attachments** to prevent users from transmitting (uploading) attachments to the system.

 - ☐ Prevent upload of attachments
- Information text: "Autopolicies are resource policies that correspond to this resource profile. In order for you must enter a fully qualified domain name in your base URLs."
- Navigation tabs: Web Access Control, Single Sign-on, Caching, Web (selected)
- Autopolicies 5 (with a left arrow icon)

The right sidebar, titled **Add Web Compression**, contains:

- Resource** (text input field)
- ACTION** (dropdown menu)
- Cancel** (button)
- Save Changes** (button)

10. Under **Client Authentication**, click '+' and specify the resources to which this policy applies in the **Resource** field and select the **Certificate** from drop down and click **Save Changes**.

The screenshot shows the Microsoft OWA 2010 configuration interface. On the left, the 'Base URL' field is visible with an information icon. Below it, the 'OWA settings' section includes 'Security Settings' with a dropdown menu set to 'Private computer'. The 'Attachments' section has two checkboxes: 'Prevent download of attachments' and 'Prevent upload of attachments'. The 'Autopolicies' section shows a list of policies, with the first one selected. On the right, the 'Add Client Authentication' dialog box is open. It has a 'Resource' field, a 'CERTIFICATE' dropdown menu, and 'Cancel' and 'Save Changes' buttons.

Lotus iNotes Versions

A Lotus iNotes template is a resource profile that controls access to the Web application and configures iNotes settings as necessary. Lotus iNotes templates significantly reduce your configuration time by consolidating settings into one place and by prepopulating a variety of resource policy settings for you depending on the type of setup you select.

The system supports intermediating traffic to Lotus iNotes through a Web rewriting resource profile template, JSAM, PSAM, and VPN Tunneling. This topic describes how to configure access using the Web rewriting template. The prepopulated values vary depending on the version of iNotes you select and are based on the most common deployment of the servers.

If any of the **Lotus iNotes** versions resource profile are selected as Profile Template, then

1. Enter the **URL** of the Lotus iNotes resource to which you want to control access In the Base URL box.
2. Under **iNotes settings**, select **Caching Settings**, select **Allow caching on client** to let Web browsers store non-user data, such as Javascript and CSS files, on a user's machine. Select **Minimize caching on client to allow** the system to send a cache-control:no-store header or a cache-control:no-cache header based on the user's Web browser and content type. This is the same as smart caching.

The Allow caching on client option caches content that the backend iNotes server typically caches. This caching option improves performance by using the cached content instead of retrieving the content from the server the next time the page displays. The Minimize caching on client option provides security by sending a cache-control:no-store header or a cache-control:no-cache header to either not store content or to re-validate the cached content each time it is requested. With both caching option, you can choose to either allow or prevent the uploading or downloading of attachments.

3. Select **Prevent download of attachments** to prohibit users from downloading attachments to their systems.

4. Select **Prevent upload of attachments** to prevent users from transmitting (uploading) attachments to the system.

Add Web Access Control

Resource ⓘ

ACTION

Cancel **Save Changes**

- Under **Single Sign-on**, select the **SSO** from drop down and specify the application's sign-in page in **Resource** field and click **Save Changes**.

The screenshot shows a configuration window with a tabbed interface. The tabs are 'Autopolicies 3', 'Web Access Control', 'Single Sign-on' (which is selected and underlined), and 'Rewriting Options'. There is also a link 'ADD AUTOPOLICY' in the top right. Below the tabs, a text instruction reads: 'Use this autopolicy to automatically pass user credentials to the Web application.' Below this instruction are two input fields: a dropdown menu labeled 'SELECT SSO' with 'Disable SSO' selected, and a text field labeled 'Resource *'. At the bottom left is a 'Cancel' button, and at the bottom right is a 'Save Changes' button.

8. Under **Caching**, click '+' and specify the resources to which this policy applies in the **Resource** field and select the **Action** from drop down and click **Save Changes**.

The screenshot shows the Microsoft Entra ID console interface. On the left, the 'Resource Profile' settings are visible, including fields for Profile Name, Description, and Base URL. Below these are sections for OWA settings, Security Settings (set to 'Private computer'), and Attachments. At the bottom, the 'Autopolicies' section is active, showing a list of policies. The 'Caching' tab is selected, and a new policy is being added. The table below shows the existing policy.

	#	Resource	Action
<input type="checkbox"/>	1	/*	unchanged

On the right, the 'Caching' configuration panel is shown. It includes a 'Resource' text field, an 'ACTION' dropdown menu, and 'Cancel' and 'Save Changes' buttons.

9. Under Rewriting Options, select the Rewriting Options:

- **Passthrough Proxy** - Select this option to specify Web applications for which the Content Intermediation Engine performs minimal intermediation.
- **No rewriting (use WSAM)** - Select this option to intermediate content using PSAM instead of the Content Intermediation Engine. Then, specify the application server for which you want to intermediate content. (At minimum, you need to click Add in order to intermediate content to and from the server that the system extracts from the Web access control policy).
- **No rewriting (use JSAM)** - Select this option to intermediate content using JSAM instead of the Content Intermediation Engine. Then, specify the application server for which you want to intermediate content. (At minimum, you need to click Add in order to intermediate content to and from the server that the system extracts from the Web access control policy).
- **No rewriting** - Select this option to automatically create a selective rewriting policy for the autopolicy's URL, thereby configuring the system to not intermediate any content to and from the resource. For example, you may choose this option if you do not want the system to intermediate traffic from web sites that reside outside of the corporate network, such as yahoo.com. If you select this option, you do not have to configure any additional rewriting settings.

If **Passthrough Proxy** is selected:

1. Choose the way in which you want to enable the passthrough proxy feature:
 - **Use virtual hostname** - If you choose this option, specify a hostname alias for the application server. When the system receives a client request for the application server hostname alias, it forwards the request to the specified application server port in the Base URL field.
 - **Use IVE port** - If you choose this option, specify a unique port in the range 11000-11099. The system listens for client requests to the application server on the specified port and forwards any requests to the application server port specified in the Base URL field.

2. Select the **Rewrite XML** check box if you want to rewrite URLs contained within XML content. If this option is disabled, the system passes the XML content "as is" to the server.
3. Select the **Rewrite external links** check box if you want to rewrite all the URLs presented to the proxy. If this option is disabled, the system rewrites only those URLs where the hostname is configured as part of the passthrough proxy policy.
4. Select the **Block cookies from being sent to the browser** check box if you want to block cookies destined for the client's browser. The system stores the cookies locally and sends them to applications whenever they are requested.
5. Select the **Host-Header forwarding** check box if you want to pass the hostname as part of the host header instead of the actual host identifier. click **Save Changes**.

The screenshot shows a configuration window titled 'Autopolicies 1' with a sub-tab 'Rewriting Options'. The main heading is 'Use this autopolicy to bypass rewriting content through the Content Intermediation Engine.' Below this, there is a dropdown menu labeled 'REWRITING OPTIONS' with 'Passthrough Proxy' selected. A note states 'A passthrough proxy will be configured based on the following:'. Below this is another dropdown labeled 'CONFIGURED' with 'Use virtual hostname' selected. A text input field labeled 'Hostname' is present with an information icon to its right. Under the heading 'Select what you want rewritten for this application.', there are four unchecked checkboxes: 'Rewrite XML', 'Rewrite external links', 'Block cookies from being sent to the browser', and 'Host-Header forwarding'. At the bottom, there are 'Cancel' and 'Save Changes' buttons.

If **No rewriting (use WSAM)** is selected

1. Create a rewriting autopolicy and select No rewriting (use WSAM).
2. In the **Destination** field, specify resources for which PSAM secures client/server traffic between the client and the system. By default, the system extracts the correct server from the Web access control policy. You may choose to use this server as-is, modify it, and/or add new servers to the list.

When specifying a server, specify the hostname (the wild cards '*' or '?' are accepted) or an IP/netmask pair. Specify multiple ports for a host as separate entries.

3. Click **Save Changes**.

The screenshot shows the configuration interface for WSAM Destination. The left panel includes a 'Profile Name' field, a 'Description' text area, and a 'Base URL' field with an information icon. Below these is the 'Sharepoint settings' section, which includes a checkbox for 'Allow in-line editing of documents within explorer view' and explanatory text. At the bottom is the 'Autopolicies' section, which has a 'Rewriting Options' dropdown menu set to 'No rewriting (use WSAM)' and a table for 'Allowed WSAM servers' with columns for a checkbox, a '#' symbol, and a 'Destination' field. The right panel, titled 'WSAM Destination', contains a 'Destination' field with an information icon, and 'Cancel' and 'Save Changes' buttons.

If **No rewriting (use JSAM)** options is selected:

1. In the **Server Name** field, enter the DNS name of the application server or the server IP address.
2. In the **Server Port** field, enter the port on which the remote server listens for client connections.
 - For example, to forward Telnet traffic from a remote machine, specify port 23 for both the client port (on which JSAM listens) and the server port (on which the Telnet server listens).
 - To enable drive mapping to this resource, enter 139 as the server port.
3. In the **Client Loopback IP** field, provide a static loopback address. If you do not provide a static IP loopback address, the system assigns an IP loopback address dynamically.

4. In the **Client Port** field, enter the port on which JSAM should listen for client application connections.

Typically, the local port value is the same value as the server port; the local port value usually only differs for Linux or Macintosh users who want to add applications for port forwarding that use ports under 1024.

To enable drive mapping to this resource, enter 139 as the server port.

It includes a description: "Use this autopolicy to automatically pass user credentials to the Windows server." Below the description are two input fields: a "Resource" field and a "SINGLE SIGN ON" dropdown menu currently set to "Use System Credentials". At the bottom of the panel are "Cancel" and "Save Changes" buttons.

Terminal Services

Terminal Services resource profile configuration instructions vary depending on whether you want to configure access to a Windows terminal server (which requires an RDP client) or Citrix terminal server (which requires an ICA client). Furthermore, if you choose to configure access to a Citrix server using a custom ICA file, you include many of your configuration settings in the ICA file itself and therefore do not need to configure them through the system.

If you configure access to a Citrix server using the default ICA file on the system, however, you must configure additional settings. You may want to create multiple bookmarks for the same terminal services resource in order to provide easy access to multiple applications. For instance, the server defined in your resource profile may provide access to multiple applications (such as Siebel and Outlook). To easily provide access to each of these applications, you can create resource profile bookmarks to each. Or, you may want to use multiple bookmarks to configure single sign-on to one application, but not another.

To create a terminal services resource profile:

1. Navigate to **Users > Resource Profiles > Terminal Services**.
2. Click '+'. Or select an existing profile from the list.

3. If **Windows Terminal Services** is selected from the Type list.
 1. Enter a unique Name and optionally a description for the resource profile. (This name becomes the default session bookmark's name.)
 2. Specify the server and port to which this resource profile should connect in the Host field. When entering the server, you may enter a hostname or IP address.
 3. Enter the port on which the terminal server listens in the Server port box. (By default, the system populates this box with port number 3389.)
 4. Select the **Create an access control policy allowing Terminal Service access to this server** check box to enable access to the server specified in the Server Port box (enabled by default).

- If you want to enable intermediation using a Java client, select **Enable Java support** and then specify which Java client the system should use.

9. Click '+' to add an applet to this list.

10. Enter **Name** to identify the applet.
11. Click the text field to browse to the applet that you want to upload.
12. Select the **Uncompress archive file** check box if the file that you selected is an archive that contains the applet. Click **OK**.
13. Enter **HTML code** with variables to replace the bookmark.
14. Select the **Criteria** from the drop down. If the Windows client launches, then this Java applet will not be used.
15. Click **Save Changes**.

6. If **Citrix Listed Applications** is selected from the Type list:

1. Enter a unique **Name** and optionally a **Description** for the resource profile. (This name becomes the default session bookmark's name.)
2. Enter the IP address and port of the Citrix MetaFrame server where the XML service is running.
 - You do not need to enter the port number if you are using the default value. The default port is 80 (if SSL is selected, the default port is 443).
 - You can enter more than one server. If the connection fails on one server, the next server in the list is used.
3. Click the **Use SSL for connecting to Citrix XML Service** check box to send the password through SSL instead of cleartext.

Although cleartext is supported, we recommend you always use SSL to avoid any security issues.

4. Enter the **Username**, **Password**, and **Domain** name for connecting to the Citrix Metaframe server where the XML service is running.
 - You can enter variable credentials such as <USERNAME> and <PASSWORD>. If you use variable credentials, the Subset of selected Applications option is disabled in the Bookmarks window.
 - When the user accesses the application list, their credentials are submitted to the Citrix XML service, substituting the session context variables <USERNAME> and <PASSWORD>. Only the user's specific applications (as determined by the Citrix administrator) are returned.
5. Select the Autopolicy: Terminal Services Access Control check box.
6. Click '+' and Specify the Metaframe servers to which you want to enable access in the **Resource** field.
7. Choose **Allow** to enable access to the specified resource or **Deny** to block access to the specified resource from the **Action** list. Click **Save Changes**.

8. Specify the server and port to which this resource profile should connect in the Host field. When entering the server, you may enter a hostname or IP address.

17. Click **Save Changes**.

Virtual Desktop

In addition to standard resource profiles and resource profile templates, you can configure virtual desktops as resource profiles. As with the other resource profiles, a virtual desktop profile contains all of the role assignments and end-user bookmarks required to provide access to an individual resource. Unlike other resource profile types, there is no resource policy to configure for virtual desktops due to the dynamic nature of virtual desktops. The IP address and port of the system is not known until the end user launches a session so dynamic ACLs are used. Icons in the Virtual Desktops section on the end user's home page represent desktops defined by the administrator. Clicking the icon launches the session using the Virtual Desktop Infrastructure (VDI) architecture.

The Citrix XenDesktop manages a pool of virtual desktops hosted on virtual machines and provides the connection management to those desktops. A list of XenDesktops is displayed to the end user as bookmarks. When a desktop is selected, the Citrix client is launched and the user can access that desktop.

VMware View Manager, formerly VMware VDI, lets you run virtual desktops in a data center that provide end users a single view of all their applications and data in a personalized environment regardless of the device or location they log in from.

To configure a Citrix XenDesktop or VMware View Manager profile:

1. Navigate to **Users > Resource Profiles > Virtual Desktops**.
2. Click '+' and Select **VMware View Manager** or **Citrix XenDesktop** from the Type drop-down list

3. Enter a **Name** and **Description** (optional) to identify this profile.
4. Enter the **Name** or **IP address** and port of the connection broker using the format ip:port.

You can enter more than one IP address. Place each address on a separate line.
5. Select the **Use SSL for connecting to the Server** check box if **SSL** is required to connect to the server.
6. Enter the **Username** to connect to the connection broker or use the **<USERNAME>** session variable.
7. Enter the **Variable Password** or **Password**
 - To use a variable password to connect to the connection broker, select Variable Password and enter the variable in the form of **<PASSWORD>** or **<PASSWORD@SEcAuthServer>**.
 - Select Password to use a static password to connect to the connection broker and enter the user credential's password.
8. Enter the **Domain** where the connection broker is located.

- Click **Save Changes**.

- If you want to enable intermediation using a Java client, select **Enable Java support** and then specify which Java client the system should use (applicable only if Citrix XenDesktop is selected in type).
- Select the Java applet that you want to associate with the resource profile from the **Applet to use** list. Or, if the applet that you want to use is not currently available in the list, click **Edit list**.

HTML5 Access

A HTML5 Access resource profile is a profile that enables users to connect to Remote Desktops or to connect to internal server hosts in the clear using Telnet protocols or to communicate over an encrypted Secure Shell (SSH) session through a Web-based terminal session emulation.

The HTML5 license count was based on the number of active HTML5 sessions. The HTML5 licenses will be counted based on the number of active users. Each user will be allowed to access up to five user sessions.

To create a HTML5 Access resource profile:

- Navigate to **Users > Resource Profiles > HTML5 Access**.
- Click '+', Select the **Solution Type** as **Basic HTML5** or **Advanced HTML5**.

3. From the Type list, specify the session type (**Windows RDP** or **SSH** or **Telnet**) for this resource profile. If you have selected Advanced HTML5 solution type, you can also specify **VNC** session type.
4. Enter a unique **Name** and optionally a **Description** for the resource profile.
5. In the **Host** field, enter the Hostname, IP or user attribute of the server to which this resource profile should connect.
6. In the **Server Port** field, enter the port on which the system should connect to the server. (By default, the system populates this field with port number 3389 if you select Windows RDP, port number 23 if you select Telnet, port number 22 if you select SSH and port number 5900 if you select VNC.)
7. Select the **Create an access control policy for HTML5 access** check box to enable access to the server specified in the Server Port box (enabled by default).
8. Click **Save Changes**.

The screenshot shows the 'Resource' configuration page. The breadcrumb trail at the top is 'HOME > SETTINGS > RESOURCE PROFILES > HTML5 ACCESS RESOURCE PROFILES'. The page title is 'Resource' with an information icon. On the left, there is a 'Resource' section with a right-pointing arrow. The main configuration area on the right includes: a 'SOLUTION TYPE' dropdown menu set to 'Advanced HTML5'; a 'TYPE' dropdown menu with a list of options: 'Windows RDP', 'VNC', 'SSH', and 'Telnet' (which is highlighted in blue); a 'Host' text input field with a red asterisk and an information icon; a 'SERVER PORT' text input field containing the value '23'; and a checked checkbox labeled 'Create an access control policy for HTML5 access.'

To configure the external storage for session recordings:

1. Navigate to **Users > Resource Profiles > Storage Configuration**.
2. Select *Enable external storage*.
3. Enter the complete storage path to store the session recordings.

4. Enter the **Username** and **Password** required to access the location.
5. Click **Save Changes**.

SAM Resource Profiles

You can create two types of PSAM resource profiles:

- PSAM application resource profiles-These resource profiles configure PSAM to secure traffic to a client/server application. When you create a PSAM application resource profile, the PSAM client intercepts requests from the specified client applications to servers in your internal network.
- PSAM destination network resource profiles-These resource profiles configure PSAM to secure traffic to a server. When you create a PSAM destination network resource profile, the PSAM client intercepts requests from processes running on the client that are connecting to the specific internal hosts.

When creating PSAM resource profiles, note that the resource profiles do not contain bookmarks. To access the applications and servers that PSAM intermediates, users must first launch PSAM and then launch the specified application or server using standard methods (such as the Windows Start menu or a desktop icon).

When you enable JSAM or PSAM through Web rewriting autopolicies in the Users > Resource Profiles > Web Applications/Pages page of the admin console, the system automatically creates JSAM or PSAM autopolicies for you. You can only view these SAM policies through the appropriate Web resource profile-not through the SAM resource profile pages of the admin console.

Client Applications PSAM

To create a PSAM application resource profile:

1. Navigate to **Users > Resource Profiles > SAM > Client Applications**.
2. Click '+'. choose **PSAM** from the Type list

3. From the Application list, select one of the options.

- **Custom** - When you select this option, you must manually enter your custom application's executable file name (such as telnet.exe). Additionally, you may specify this file's path and MD5 hash of the executable file (although it is not required that you specify the exact path to the executable). If you enter an MD5 hash value, PSAM verifies that the checksum value of the executable matches this value. If the values do not match, PSAM notifies the user that the identity of the application could not be verified and does not forward connections from the application to the system.
- **Lotus Notes** - When you select this option, PSAM intermediates traffic from the Lotus Notes fat client application.
- **Microsoft Outlook** - When you select this option, PSAM intermediates traffic from the Microsoft Outlook application.
- **NetBIOS file browsing** - When you select this option, PSAM intercepts NetBIOS name lookups in the TDI drivers on port 137.
- **Citrix** - When you select this option, PSAM intermediates traffic from Citrix applications.

The system supports several mechanisms for intermediating traffic to the Lotus Notes, Microsoft Outlook, and Citrix applications.

- **Domain Authentication** - Select this option to allow integrated Windows applications, such as file sharing, Outlook, and so forth to authenticate to the domain controller when the client machine is part of a domain. Before using this option, you must:
 - Specify domain controllers that are reachable through the system in the PSAM Destination list so that LDAP and Kerberos traffic can be proxied and sent to the system.
 - Configure a PSAM Access Control Policy (ACL) to allow access to all domain controllers.

4. Enter a unique **Name** and optionally a **Description** for the resource profile.

5. Enter the **File Name** and **Path** and in case of **Windows Platform** enter **MD5 Hash**.
6. Under **Autopolicy: SAM Access Control** (this is applicable only for PSAM), click '+' specific **Resource** under the Base URL. Enter the full URL of the resource, select **Allow** or **Deny**, and click **Save Changes**.

Client Applications JSAM

JSAM resource profiles configure JSAM to secure traffic to a client/server application. When you create a JSAM application resource profile, the JSAM client tunnels network traffic generated by the specified client applications to servers in your internal network.

To create a JSAM applied

1. Navigate to **Users > Resource Profiles > SAM > Client Applications**.
2. Click '+'. choose **JSAM** from the Type list.

3. From the Application list, select one of the options.
 - **Custom** - Select this option to intermediate traffic to a custom application. Then:
 1. Under JSAM Port Forwarding click '+'.
 2. In the **Server Name** field, enter the name or IP address of the remote server. If you are using automatic host mapping, enter the server as it is known to the application. If you enter an IP address, note that end users must connect to JSAM using that IP address in order to connect to the specified server.
 3. In the **Server Port** field, enter the port on which the remote server listens for client connections. For example, to forward Telnet traffic from a remote machine, specify port 23 for both the client port (on which JSAM listens) and the server port (on which the Telnet server listens).
 - To disable the registry change made by JSAM and restore the original copy of the etc/hosts file, users must uninstall the JSAM client using settings in the Preferences > Applications page of the end-user console. To re-enable the change, they need to reboot.
 - You can also use the restore system settings script. However, the restore system settings script cannot restore the hosts file successfully if you log in as a different user from the one that originally launched JSAM.
 4. In the **Client Loopback IP field**, provide a static loopback address. If you do not provide a static IP loopback address, the system assigns an IP loopback address dynamically.
 5. In the **Client Port** field, enter the port on which JSAM should listen for client application connections. Typically, the local port value is the same value as the server port; the local port value usually only differs for Linux or Macintosh non-root users who want to add applications for port forwarding that use ports under 1024.
 6. Click **Save Changes**.
4. Select the **Allow JSAM to dynamically select an available port if the specified client port is in use** check box if JSAM is listening for multiple hosts on the same port and you want JSAM to select an available port when the client port you specify is taken. The client application must allow you to specify the port number for the connection in order to use this option.

5. Select the **Create an access control policy allowing SAM access to these servers** check box to enable access to the list of servers specified in the Server column (enabled by default).

PSAM Destinations

When you create a PSAM destination network resource profile, the PSAM client intercepts requests from processes running on the client to internal hosts. When destinations (using either IP address or hostnames) are configured on the system, all DNS and NetBIOS names are resolved through the system.

To create a PSAM destination network resource profile:

- Navigate to **Users > Resource Profiles > SAM > PSAM Destinations**.
- Click '+', enter a unique **Name** and optionally a **Description** for the resource profile.

Secure Mail

To use Secure Mail for iOS devices, you must enable it at the role level and then create a resource profile that specifies the Exchange server and encryption settings. You must also obtain and import an S/MIME certificate.

To define the Secure Mail resource profile:

1. Navigate to **Users > Resource Profiles > Mobile**.

2. Specify the information in the following table:

Secure Mail ⓘ

Secure Mail >

S/MIME Certificates

This section configures an Exchange Server to proxy connections through this device. The mobile device must be on-boarded to use the features listed here (on-boarding requires authentication and will install a mail profile).

Virtual Hostname ⓘ Exchange Server ⓘ

Description

The configuration options below will apply only for the devices that are onboarded via Ivanti Connect Secure.

INSERT VALUE FOR SERVER ⓘ

USERNAME ⓘ
<USER>

Secure Mail Options:

☐ **Encrypt Body**
The SMIME certificate will be used for encryption.

☐ **Encrypt Attachments**
FILE EXTENSIONS
.bmp;.csv;.doc;.docx;.ht ⓘ

☐ **Allow Outbound E-mail Attachments**

NOTE: This is a "preview feature". This feature currently entitles you to test and manage up to 15 mailboxes on Apple iOS devices (This message is not applicable for Pulse WorkSpace onboarded devices).

Save Changes

Secure Mail Settings

Setting	Guidelines
Virtual Hostname	Enter a hostname alias for the Exchange server, and update your DNS server to map the alias to the IP address of Ivanti Connect Secure. The name must be unique among all virtual hostnames.

Setting	Guidelines
	<p>For example, if the virtual hostname is email.com, and the backend URL is https://mail.pulsesecure.net:8080, a client request to https://email.com/test1 via Ivanti Connect Secure is converted to https://mail.pulsesecure.net:8080/test1. The response to the converted request is sent to the client web browser.</p>
Exchange Server	Enter the URL and port number of the Microsoft Exchange server, such as https://mail.pulsesecure.net:379. If the port number is omitted, it defaults to 80.
Description	Description of the Exchange server (optional).
Username	<p>Select one of the following to specify the e-mail account format used by the Exchange server:</p> <ul style="list-style-type: none"> • None: Inserts the <USER> variable for the user's login name for Ivanti Connect Secure (the default). • Exchange 2007/2010/2013: Inserts the <NTDOMAIN> <USER> variables to include the user's domain before the login name. • Office 365: Inserts <USER>@domain.com, and you can enter the appropriate domain, such as <USER>@pulsesecure.net.
Secure Mail Options	<p>Select one or more of the following encryption options:</p> <ul style="list-style-type: none"> • Encrypt Body: Encrypts the body of the e-mail using an S/MIME certificate. The encrypted e-mail body can be viewed by any native e-mail client. <p>Graphics embedded in the encrypted e-mail body are displayed twice on iOS devices.</p>

Setting	Guidelines
	<ul style="list-style-type: none"> Encrypt Attachments: Encrypts the e-mail attachments using a key generated by Ivanti Connect Secure. Encrypted attachments, which must be opened with Ivanti Mobile Client, are identified by a pulsesecure file extension, such as report.pdf.pulsesecure. The encrypted file types are listed in the File Extensions text box, separated by semicolons. You can add or delete file extensions from the list. <p>If you add .gif, .jpeg, .jpg, .png or .htm to the list of encrypted file types, graphics embedded in the e-mail body are not displayed correctly on iOS devices.</p> Allow Outbound E-Mail Attachments: Decrypts attachments before forwarding an e-mail to an external account. If this option is not selected, e-mails are forwarded without attachments and include a note indicating that attachments were removed. <p>If you change the encryption settings, onboarded devices must be re-onboarded to obtain the new settings.</p>

3. Click **Save Changes**.

S/MIME Certificate

If you enable Secure Mail, an S/MIME is required for each client device. You can generate an S/MIME certificate for each device or use a global certificate for all devices by requesting an S/MIME certificate from a Certificate Authority (CA) and importing the certificate and private key to Ivanti Connect Secure.

To generate or import an S/MIME certificate:

1. Navigate to **Users > Resource Profiles > Mobile > S/MIME Certificate**.

NODE68-SULTHAN / S/MIME CERTIFICATES

Resource Policies

A resource policy is a system rule that specifies resources and actions for a particular access feature. A resource is either a server or file that can be accessed through the system, and an action is to "allow" or "deny" a resource or to perform or not perform a function. Each access feature has one or more types of policies, which determine the system's response to a user request or how to enable an access feature. You may also define detailed rules for a resource policy, which enable you to evaluate additional requirements for specific user requests.

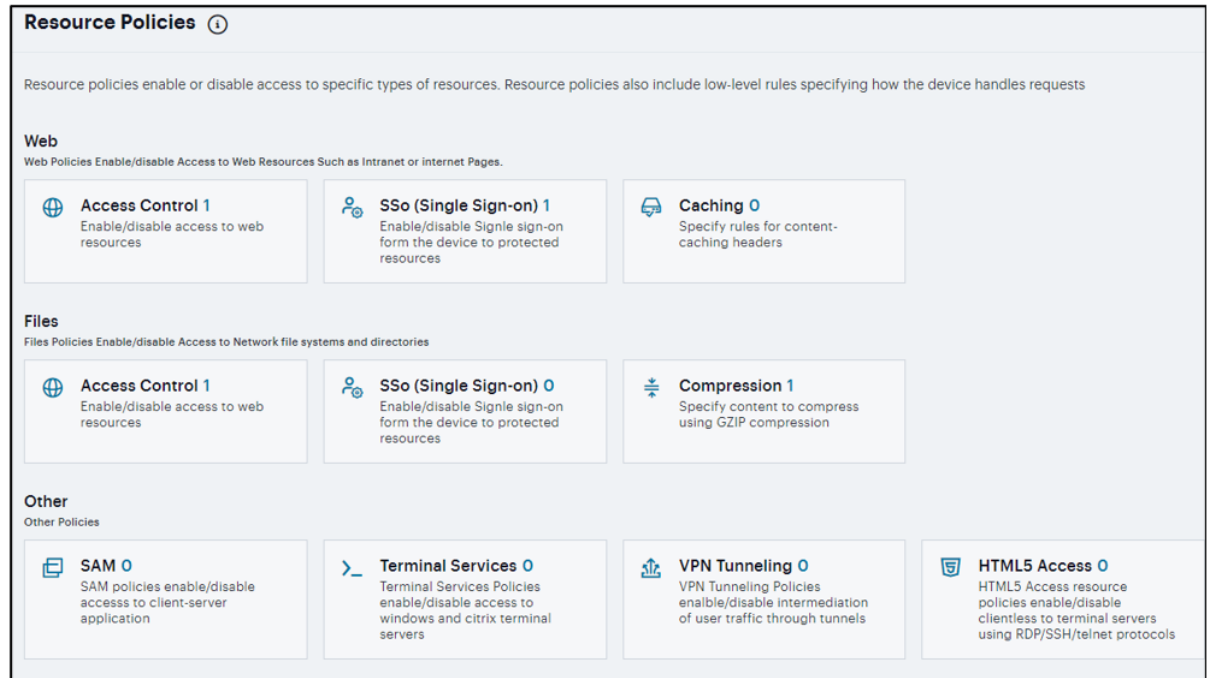

You can create the following types of resource policies through the Resource Policies pages:

- **Web Resource Policies** - specify the Web resources to which users may or may not browse. They also contain additional specifications such as header caching requirements, servers to which java applets can connect, code-signing certificates that the system should use to sign java applets, resources that the system should and should not rewrite, applications for which the system performs minimal intermediation, and single sign-on options.
- **File Resource Policies** - specify the Windows, UNIX, and NFS file resources to which users may or may not browse. hey also contain additional specifications such as file resources for which users need to provide additional credentials.
- **Secure Application Manager Resource Policies** - allow or deny access to applications configured to use JSAM or PSAM to make socket connections.
- **Terminal Services Policies** - allow or deny access to the specified Windows servers or Citrix Metaframe servers.
- **VPN Tunneling Resource Policies** - allow or deny access to the specified servers and specified IP address pools.
- **HTML5 Access Resource Policies** - allow or deny clientless to terminal servers using RDP/SSH/Telnet protocols.

You can also create resource policies as part of the resource profile configuration process. In this case, the resource policies are called "advanced policies."

Resource policies are an integral part of the access management framework, and therefore are available on all Ivanti Connect Secure products. However, you can access only resource policy types that correspond to your licensed features.

VPN Tunneling Resource Policy Configuration Use Case

This topic describes a real-world VPN tunneling application and the steps necessary to configure the appropriate resource policy providing access to remote users on the network.

Large financial institutions (also called Fortune Companies) require a robust client sign-in application like VPN tunneling to help provide remote employees seamless network connection to a large range of enterprise resources at the corporate headquarters. Often, remote users need to be able to access multiple applications on their laptops/client machines beyond simple e-mail or meeting scheduling applications. These remote super users or power users require secure, encrypted access to powerful server applications like Microsoft OutlookTM, OracleTM databases, and the RemedyTM case management system.

- FQDN supports IPv6 only on Windows, and IPv4 only on other platforms.
- FQDN-based split tunneling supports dual stack (both IPv6 and IPv4) only on Windows, and not supported on other platforms.
- FQDN based split tunneling only supported with IPv4 Traffic Enforcement feature enabled for the respective role.

For this scenario, let's assume the following:

- There is a small collection of remote users who will all access their financial institution's enterprise resources via the same device.

- All the users have the same `user_role_remote` role assigned to their user ID
- Host Checker and Cache Cleaner are configured and verifying the users' machines upon logging into a device and launching their VPN tunneling sessions
- All users require access to three large servers at the corporate headquarters with the following attributes:
 - `outlook.acme.com` at IP address 10.2.3.201
 - `oracle.financial.acme.com` at IP address 10.2.3.202
 - `case.remedy.acme.com` at IP address 10.2.3.99
- Because the Company wants to manage their IP address pool very strictly, each device provides IP addresses to remote users (our particular device controls the IP addresses between 10.2.3.128 and 10.2.3.192)
- The company is interested in the most secure access possible, simultaneously accepting only the least possible amount of client down-time

To configure a VPN tunneling resource policy providing appropriate access to the Fortune Company remote users:

1. Create a new **VPN tunneling resource policy** where you specify the three servers to which you want to grant remote users access:
 - In the **New Profile** section, specify the IP address ranges necessary to allow access to the three servers (**outlook.acme.com**, **oracle.financial.acme.com**, and **case.remedy.acme.com**) separated by carriage returns.

`udp://10.2.3.64-127:80,443`

`udp://10.2.3.192-255:80,443`

Configuring your resource as 10.1.1.1-128:* is not supported. Doing so will result in an error.

- In the **Roles** section, select the **Policy applies to SELECTED** roles option and ensure that only the "user_role_remote" role appears in the **Selected roles** list.
 - In the Action section, select the **Allow access** option.
2. Create a new VPN tunneling connection profile where you define the transport and encryption method for the data tunnel between the client(s) and system:

- In the **IP address assignment** section, select the disable IPv4 address assignment and enable IPv6 address assignment check boxes as per your requirement. Then specify the assignable IPv4 address and IPv6 address ranges in the associated text field.

New Profile | Connection Settings | DNS Settings | Proxy Settings

Ivanti Secure Access Client Connection Set Options

The following items apply to all connections in a connection set.

- **Allow saving logon information:** Controls whether the Save Settings check box is available in login dialog boxes in Ivanti Secure Access Client. If you clear this check box, Ivanti Secure Access Client always requires users to provide credentials. If you select this check box, users have the option of saving their credentials.

- Ivanti Secure Access Client can retain learned user settings: These settings are retained securely on the endpoint, evolving as the user connects through different Ivanti servers. Ivanti Secure Access Client can save the following settings:
 - Certificate acceptance
 - Certificate selection
 - Realm
 - Username and password
 - Proxy username and password
 - Secondary username and password
 - Role
- VPN only access: When Ivanti Secure Access Client connects to Ivanti Connect Secure having lock down mode enabled, it will enable lock-down mode and block network if VPN is not in connected state.

When VPN only access option is enabled, the Enable captive portal detection and Enable embedded browser for captive portal will be automatically checked and cannot be edited.

- Display splash screen: Clear this check box to hide the Ivanti Secure Access Client splash screen that normally appears when Ivanti Secure Access Client starts.
- Dynamic certificate trust: Determines whether users can opt to trust unknown certificates. If you select this check box, a user can ignore warnings about invalid certificates and connect to the target Ivanti server.

- **Dynamic connections:** Allows connections within this connection set to be automatically updated or added to Ivanti Secure Access Client when the user connects to Ivanti Connect Secure through the user Web portal, and then starts Ivanti Secure Access Client through the Web portal interface. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Ivanti server and launches Ivanti Secure Access Client from the server's Web interface.

If dynamic connections are disabled, and the user logs in through the Web portal of a Ivanti server that is not already included in Ivanti Secure Access Client's connection set, then starting Ivanti Secure Access Client from the Web portal does not add a new Ivanti Secure Access Client connection for that Ivanti server. If you choose to disable dynamic connections, you can still allow users to manually create connections by enabling Allow User Connections.

- **Enable captive portal detection:** To detect the presence of a captive portal hotspot enable this option. It can be applied only to Ivanti Connect Secure and Ivanti Policy Secure (L3) connections.
- **Enable embedded browser for captive portal:** When enabled, Ivanti Secure Access Client uses an embedded web browser that the end user can use to traverse captive portal pages and to gain network connectivity for establishing a VPN connection. This applies only when captive portal detection is enabled.
- **Enable embedded browser for authentication:** When enabled, Ivanti Secure Access Client uses an embedded browser for web authentication, rather than external browser.
- **FIPS mode enabled:** Enable FIPS mode communications for all Ivanti Secure Access Client connections in the connection set. The Federal Information Processing Standard (FIPS) defines secure communications for the U.S. government. When a Ivanti Secure Access Client connection is operating in FIPS mode, FIPS On appears in the lower corner of the Ivanti Secure Access Client interface. If your Ivanti Connect Secure hardware does not support FIPS mode operations, FIPS mode configuration options are not present in the admin console interface. FIPS mode operations are supported on PSA-V Series Ivanti Gateways and some SA series appliances. The device must be running Ivanti Policy Secure R5.0 or later or Ivanti Connect Secure R8.0 or later.
- **Prevent caching smart card PIN:** Enabling this field will allow system administrators to prevent smart card PIN values from being cached. This feature is applicable only to Windows.

- **Wireless suppression:** Disables wireless access when a wired connection is available. If the wired connection is removed, Ivanti Secure Access Client enables the wireless connections with the following properties:
 - Connect even if the network is not broadcasting.
 - Authenticate as computer when computer information is available.
 - Connect when this network is in range.

Creating a Client Connection Set for Ivanti Connect Secure

To create a Ivanti Secure Access Client connection set:

1. Select **Users > Ivanti Secure Access Client > Connections**.
2. Click '+' to create a new connection set.

3. Enter a name and, optionally, a description for this connection set.

Save Changes

4. Under Options, select or clear the following check boxes:
 - **Allow saving logon information:** Controls whether the Save Settings check box is available in login credential dialog boxes in Ivanti Secure Access Client. If you clear this check box, Ivanti Secure Access Client always requires users to provide credentials. If you select this check box, users have the option of saving their credentials.
 - **Allow user connections:** Controls whether connections can be added by the user through the Ivanti Secure Access Client interface.
 - **Display splash screen:** Clear this check box to hide the Ivanti Secure Access Client splash screen that normally appears when Ivanti Secure Access Client starts.
 - **Dynamic certificate trust:** Determines whether users can opt to trust unknown certificates. If you select this check box, a user can ignore warnings about invalid certificates and connect to the target Ivanti server.
 - **Dynamic connections:** Allows new connections to be added automatically to Ivanti Secure Access Client when the user logs into a Ivanti server through the server's Web portal, and then starts Ivanti Secure Access Client through the Web portal interface.
 - **FIPS mode enabled:** Enable FIPS mode communications for all Ivanti Secure Access Client connections in the connection set. The Federal Information Processing Standard (FIPS) defines secure communications for the U.S. government. When a Ivanti Secure Access Client connection is operating in FIPS mode, FIPS On appears in the lower corner of the Ivanti Secure Access Client interface.
 - **Wireless suppression:** Disables wireless access when a wired connection is available. Wireless suppression occurs only when the wired connection is connected and authorized.
5. Under Connections, click '+' to define a new connection.
6. Enter a name and, optionally, a description for this connection.

7. Select a type for the connection and then specify the connection. Type can be any of the following:
 - **Policy Secure (802.1X):** Select this type if the connection establishes connectivity to an 802.1X wired or wireless device.
 - **Connect Secure or Policy Secure (L3):** Select this type to define a connection for Ivanti Connect Secure or Ivanti Policy Secure.
8. The connection configuration options that appear depend on the connection type you select.

After you have created the client connection set:

- create a client component set and select this connection set.
- open this saved connection set and create sub connection set for it.

Creating a Client Component Set for Ivanti Connect Secure

To create a Ivanti Secure Access Secure Client component set:

1. Select **Users > Ivanti Secure Access Client > Components**.
2. Click '+' to create a new component set.

The screenshot shows a web-based form titled "New Component Set" with a breadcrumb path "ICS-BNG / IVANTI SECURE ACCESS CLIENT / COMPONENTS". The form includes a "Name" text field, a "Description" text area, a "CONNECTION SET" dropdown menu currently set to "None", and an "IVANTI SECURE ACCESS CLIENT COMPONENTS" dropdown menu currently set to "All components". A small note at the bottom of the second dropdown states: "Client component options affect Web-based installations only. For a preconfigured installer, specify components as part of the MSIEXEC command." At the bottom of the form are "Cancel" and "Save Changes" buttons.

3. If you have not yet created a client connection set, select **Users > Ivanti Secure Access Client > Connections** and create a new connection set. Or you can use the default client configuration, which permits dynamic connections, and allows Ivanti Secure Access Client to automatically connect to Ivanti Policy Secure or Ivanti Connect Secure.
4. Specify a name for the client component set.
5. (Optional) Enter a description for this client component set.
6. Select a connection set that you have created, or use the default connection set.
7. For Ivanti Secure Access Client components, select one of the following options:
 - All components: Supports all Ivanti Secure Access Client connection types.
 - No components: Updates existing Ivanti Secure Access Client configurations, for example, to add a new connection. Do not use this setting for a new installation.
8. Click **Save Changes**.
9. After you create a component set, distribute Ivanti Secure Access Client to users through a role. When users access the role, the installer automatically downloads to the endpoint. The installer components and connections are applied to the endpoint client.
 - If client connections associated with the component set for a role are changed even though the list of components has not, the existing configuration on the endpoint is replaced immediately if the endpoint is currently connected, or the next time the endpoint connects.
 - If a user is assigned to multiple roles and the roles include different component sets, the first role in an endpoint's list of roles is the one that determines which client (component set) is deployed.

Manage Ivanti Secure Access Client Versions

This feature is supported for Ivanti Secure Access Client on macOS and Windows, and supported for iOS Mobile Client and Android Mobile Client also.

This feature allows admin to configure a minimum client version. If the client has version lower than the configured minimum version, then the ICS server will reject the client connection.

If the client is older than the configured minimum client version, then ICS gateway will reject the connection. User can upgrade it later through browser or SCCM server.

To enable this feature on Ivanti Connect Secure:

1. From the admin console, select **Users > Ivanti > Components**.
2. Select the Enable minimum client version enforcement check box (see). The following options appear:
 - Ivanti Secure Access Desktop Clients
 - Android Mobile Clients
 - iOS Mobile Clients

Enterprise Onboarding

Enterprise onboarding allows users to securely access enterprise network resources with almost any device. WiFi, VPN and certificate profiles can be defined for enterprise resources and downloaded to a device during onboarding, depending on the device type.

The profiles can be defined on a single Ivanti Connect Secure server dedicated to onboarding or they can be defined on each server. Alternatively, the profiles can be defined on a third-party MDM server, in which case users will see a link and instructions on the onboarding page to continue onboarding using the external MDM server.

Onboarding is initiated from the browser. The supported profiles depend on the device type and whether the Ivanti Secure Access Client is installed. Device Onboarding Profile supports:

- Android 4.0 or later: Supports all profiles, but the Ivanti Secure Access Client must be installed during onboarding.
- iOS 6.0 or later: Supports all profiles (Safari browser).
- Windows 7.0, 8.0, and 8.1: Supports WiFi and certificate profiles (IE, Firefox, or Chrome browser). The Ivanti Secure Access Client onboarding application must be installed during onboarding. Windows 8 RT and Windows 8 Phone are not supported.
- MAC OS X: Supports WiFi and certificate profiles (Safari browser).

Enterprise onboarding is enabled in the user role, and each profile can be applied to all user roles or specific roles. The SCEP server and CSR templates allow certificates to be generated dynamically for device and server authentication.

Defining the SCEP Server

The Simple Certificate Enrollment Protocol (SCEP) server configuration and CSR templates allows each client device to dynamically obtain certificates for authentication.

To define the SCEP server:

1. Log into the nSA as a Tenant Admin.
2. From the ICS menu, click the **Gateway > Gateway List** and then select any standalone ICS Gateway.
3. Navigate to **Users > Enterprise Onboarding**.

The screenshot shows the 'SCEP Configuration' page. On the left is a sidebar with links: SCEP Configuration, CSR Templates, VPN Profiles, WiFi Profiles, Certificate Profiles, and Secure mail. The main area contains the following fields and sections:

- SCEP Configuration** (with a help icon):
 - SCEP SERVER URL: (with a help icon)
 - CHALLENGE: (with a help icon)
 - RETRIES: (with a help icon)
 - RETRY DELAY: (with a help icon)
- Upload Encryption Certificate** (with an expand/collapse icon):
 - FILENAME: (with a browse icon)
 - Used to encrypt the requests to SCEP Server
 - Manually upload the encryption certificate or run Test Configuration below with Test Enrollment to upload it automatically.
- Response Signing Certificate** (two columns):

Response Signing Certificate		Response Signing Certificate	
Issued To	N/A	Version	N/A
Issued By:	N/A	Signature Algorithm	N/A
Valid	N/A	Thumbprint Algorithm	N/A
		Thumbprint	N/A
- Buttons: **Test Configuration**, ☒ **Test Connectivity**, ☐ **Test Enrollment**
- Save Changes** button at the bottom right.

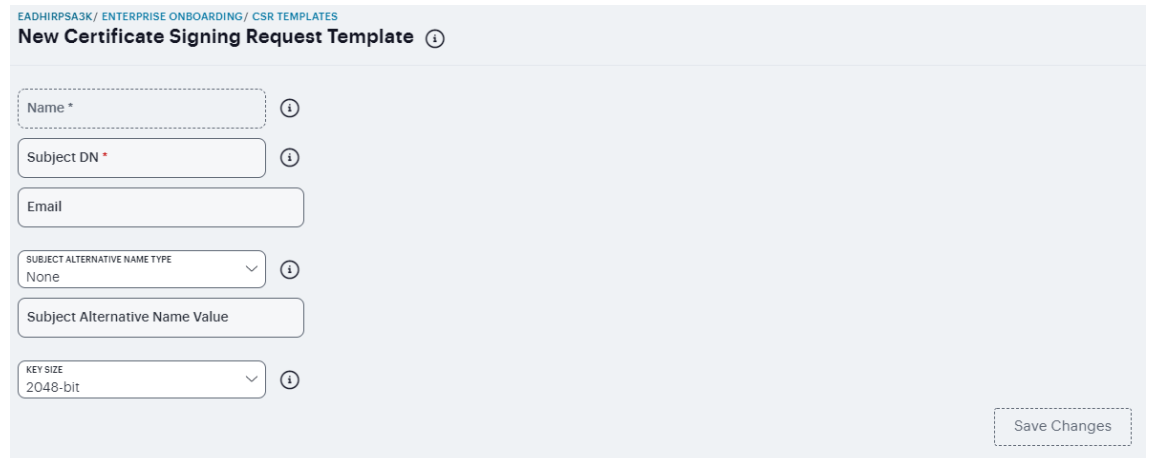

4. Enter the URL for the SCEP server.
5. Specify the password required by the SCEP server.
6. Specify the number of attempts to access the server when the first attempt fails.
7. Specify the number of seconds between retry attempts.
8. Click Browse to upload the certificate used to encrypt SCEP requests. To upload the certificate automatically, select the Test Enrollment check box, select a CSR template, and click **Test Configuration**.
9. Click **Save Changes**.

Defining CSR Templates

If the SCEP server is configured, the Certificate Signing Request (CSR) templates can be used in the VPN, WiFi, and certificate profiles to allow each onboarded device to dynamically obtain certificates for authentication on all mobile devices. Up to 10 templates can be defined.

To define CSR templates:

1. Navigate to **Users > Enterprise Onboarding** and select **CSR Templates**.

The screenshot shows the 'New Certificate Signing Request Template' form. At the top, the breadcrumb is 'EADHIRPSA3K / ENTERPRISE ONBOARDING / CSR TEMPLATES'. The title is 'New Certificate Signing Request Template' with a help icon. The form contains the following fields: 'Name *' (text input), 'Subject DN *' (text input), 'Email' (text input), 'SUBJECT ALTERNATIVE NAME TYPE' (dropdown menu with 'None' selected), 'Subject Alternative Name Value' (text input), and 'KEY SIZE' (dropdown menu with '2048-bit' selected). Each field has a help icon. A 'Save Changes' button is located at the bottom right of the form.

2. Click '+' to add a new template.
3. Enter a unique template name.
4. Specify the subject distinguished name. For example:
CN= <USERNAME>,OU=Engineering=Ivanti
5. (Optional) Specify an email address with the <USER> variable, such as <USER>@ivanti.com.
6. Select an alternative name type if the CA requires an alternative subject name.
7. Specify one or more values for the selected alternative name type. Multiple values must be separated by a comma or space.
8. Select the key size used by the SCEP server.
9. Click **Save Changes**.

Defining VPN Profiles

VPN profiles provide Android and iOS devices with secure access to enterprise networks. One or more VPN profiles can be assigned to specific user roles or to all roles. Up to 10 profiles can be defined.

To define VPN profiles:

1. Navigate to **Users > Enterprise Onboarding** and select **VPN Profiles**.

The screenshot shows the 'New VPN Profile' configuration page. At the top, the breadcrumb is 'EADHIRPSASK / ENTERPRISE ONBOARDING / VPN PROFILES'. The title is 'New VPN Profile' with an information icon. The form includes the following fields and sections:

- Name ***: A text input field with an information icon.
- Description**: A large text area.
- Apply to Client Types**: Two checkboxes, ☐ iOS and ☐ Android.
- Server URL ***: A text input field with an information icon.
- Realm**: A text input field.
- Role**: A text input field.
- Username**: A text input field.
- Authentication Method**: A dropdown menu currently showing 'Password'.
- Roles**: A section with a note: 'Enterprise Onboarding' in the Role must be enabled in order for this policy to take effect. Below it is a dropdown menu showing 'Policy applies to ALL roles'.
- Available Roles 9**: A list of roles with checkboxes: ☐ Android_CloudSecure_Role, ☐ CloudSecure_Remedy_Role, ☐ CTX_User, ☐ Ecp_CloudSecure_Role, ☐ iOS_CloudSecure_Role, ☐ Mac_CloudSecure_Role, ☐ Outlook Anywhere User Role, ☐ Users, and ☐ Windows_CloudSecure_Role.
- Selected Roles 0**: A section with a 'Select All' checkbox and a large empty box with a warning icon and the text 'No Items'. Navigation arrows (> and <) are between the two lists.
- Save Changes**: A button in the bottom right corner.

2. Click '+' to add a new VPN profile.
3. Enter a unique name for the VPN profile.
4. (Optional) Enter a description of the VPN profile.
5. Select the device types the profile applies to (Android and iOS only).
6. Specify the URL of the VPN server.

7. Specify the realm name. The realm is required only if the sign-in URL has the User picks from a list of authentication realms option enabled.
8. Specify the user role. The user role is required if the role mapping rules for the user realm specify multiple roles and the User must select from among assigned roles option is enabled.
9. Specify the <USER> variable for the user name.
10. Select Password or Certificate for the user authentication method.
11. Select one of the following options:
 - Policy applies to ALL roles - To apply this profile to all users.
 - Policy applies to SELECTED roles - To apply this profile only to users who are mapped to roles in the Selected roles list. Make sure to add roles to this list from the Available roles list.
 - Policy applies to all roles OTHER THAN those selected below - To apply this profile to all users except for those who map to the roles in the Selected roles list. Make sure to add roles to this list from the Available roles list.
12. Click **Save Changes**.

Defining WiFi Profiles

WiFi profiles provide Android, iOS, MAC OS X, and Windows devices with secure access to wireless networks. One or more WiFi profiles can be assigned to specific user roles or to all roles. Up to 10 profiles can be defined.

To define WiFi profiles:

1. Navigate to **Users > Enterprise Onboarding** and select **WiFi Profiles**.

EADHIRPSASK / ENTERPRISE ONBOARDING / WIFI PROFILES

New WiFi Profiles ⓘ

Name *

Description

Apply to Client Types

- ☒ iOS
- ☒ Android
- ☒ Mac OS X
- ☒ Windows

SSID *

☐ Non-Broadcast SSID

☐ Auto Connect
Not applicable for Android clients.

SECURITY TYPE
NONE

Roles
'Enterprise Onboarding' in the Role must be enabled in order for this policy to take effect.

ROLES
Policy applies to ALL roles

Available Roles 9

☐ Select All

- ☐ Android_CloudSecure_Role
- ☐ CloudSecure_Remed_Role
- ☐ CTX_User
- ☐ Ecp_CloudSecure_Role
- ☐ iOS_CloudSecure_Role
- ☐ Mac_CloudSecure_Role
- ☐ Outlook Anywhere User Role
- ☐ Users
- ☐ Windows_CloudSecure_Role

Selected Roles 0

☐ Select All

No Items

2. Click '+' to add a new WiFi profile.
3. Enter a unique name for the WiFi profile.
4. (Optional) Enter a description of the profile.

5. Select the device types the profile applies to (Android, iOS, MAC OS X, and Windows).
6. Specify the server set ID of the wireless network.
7. Select the **Non-Broadcast SSID** check box if the wireless network does not broadcast its identity.
8. Select the **Auto Connect** check box to connect the client automatically when the network is detected (not supported by Android clients).
9. Select the type of authentication used by the network, and specify the password or enterprise settings, as required.
10. For the WPA Enterprise and WPA2 Enterprise security types, select the supported EAP protocols and specify the associated authentication settings.
11. The PEAP protocol is supported by all clients. Specify inner authentication method, username and password, outer identity, Trusted Server name, Trusted CA certificate.
12. The EAP-TLS protocol is supported by all clients. Specify User name, CSR template, IP address or FQDN name, Trusted CA certificate.
13. The TTLS protocol is supported by all clients. Specify inner authentication method, username and password, Trusted Server name, Trusted CA certificate.
14. Select a role from Policy applies to ALL roles, Policy applies to SELECTED roles, Policy applies to all roles OTHER THAN those selected below.
15. Click **Save Changes**.

Defining Certificate Profiles

Certificate profiles specify the device certificates sent to each client device during onboarding. Up to 10 profiles can be defined.

To define certificate profiles:

1. Navigate to **Users > Enterprise Onboarding** and select **Certificate Profiles**.

The screenshot shows the 'Certificate profile' configuration page. At the top, the breadcrumb is 'EADHIRPSA3K / ENTERPRISE ONBOARDING / CERTIFICATE PROFILE'. The page title is 'Certificate profile' with an information icon. Below the title, there are two input fields: 'Name' (required, with an information icon) and 'Description'. Under 'Apply to Client Types', there are four checked checkboxes: 'iOS', 'Android', 'Mac OS X', and 'Windows'. Below these are three unchecked checkboxes: 'Import and Use Global Certificate', 'Import and Use CA Certificate', and 'Generate per User Certificate'. The 'Roles' section has a note: 'Enterprise Onboarding' in the Role must be enabled in order for this policy to take effect. Below this is a dropdown menu labeled 'ROLES' with the text 'Policy applies to ALL roles'. To the left of the 'Available Roles' list (9 items) is a 'Select All' checkbox. The list includes: 'Android_CloudSecure_Role', 'CloudSecure_Remed_Role', 'CTX_User', 'Ecp_CloudSecure_Role', 'iOS_CloudSecure_Role', 'Mac_CloudSecure_Role', 'Outlook Anywhere User Role', 'Users', and 'Windows_CloudSecure_Role'. To the right of the 'Selected Roles' list (0 items) is a 'Select All' checkbox. The 'Selected Roles' list is empty and shows a 'No Items' message. At the bottom right, there is a 'Save Changes' button.

2. Click '+' to add a new certificate profile.
3. Select the device types the profile applies to (Android, iOS, MAC OS X, and Windows).
4. Select the **Import and Use Global Certificate** option to use the Ivanti Connect Secure global certificate to authenticate the client device. Click **Import Certificate & Key**, click **Browse** to locate the certificate file, and then click **Import**.

5. Select the **Import and Use CA Certificate** option to import any CA certificate (public Root CA, private Root CA, public intermediate CA, or private intermediate CA). These CA's can be used in WiFi profiles and must be downloaded to the client devices. Click Import and Use CA Certificate, click **Browse** to locate the certificate, and then click **Import CA Certificate**.
6. Select the **Generate per User Certificate** option to use the SCEP server and a CSR template to generate a certificate for each client. Select a CSR template from the Use Certificate Template list.
7. Select a role from Policy applies to ALL roles, Policy applies to SELECTED roles, Policy applies to all roles OTHER THAN those selected below.
8. Click **Save Changes**.

Defining Secure Mail

To define secure mail:

1. Navigate to **Users > Enterprise Onboarding** and select **Secure Mail**.

EADHIRPSASK / SECURE MAIL

Secure Mail ⓘ

Secure Mail >

S/MIME Certificates

This section configures an Exchange Server to proxy connections through this device. The mobile device must be on-boarded to use the features listed here (on-boarding requires authentication and will install a mail profile).

Virtual Hostname ⓘ

Exchange Server ⓘ

Description

The configuration options below will apply only for the devices that are onboarded via Ivanti Connect Secure.

INSERT VALUE FOR SERVER ⓘ

USERNAME ⓘ
<USER>

Secure Mail Options:

☐ Encrypt Body

The SMIME certificate will be used for encryption.

☐ Encrypt Attachments

FILE EXTENSIONS
.bmp;.csv;.doc;.docx;.ht

ⓘ

☐ Allow Outbound E-mail Attachments

NOTE: This is a "preview feature". This feature currently entitles you to test and manage up to 15 mailboxes on Apple iOS devices (This message is not applicable for Pulse WorkSpace onboarded devices).

Save Changes

For the configuration details, see ["Secure Mail" on page 462](#).

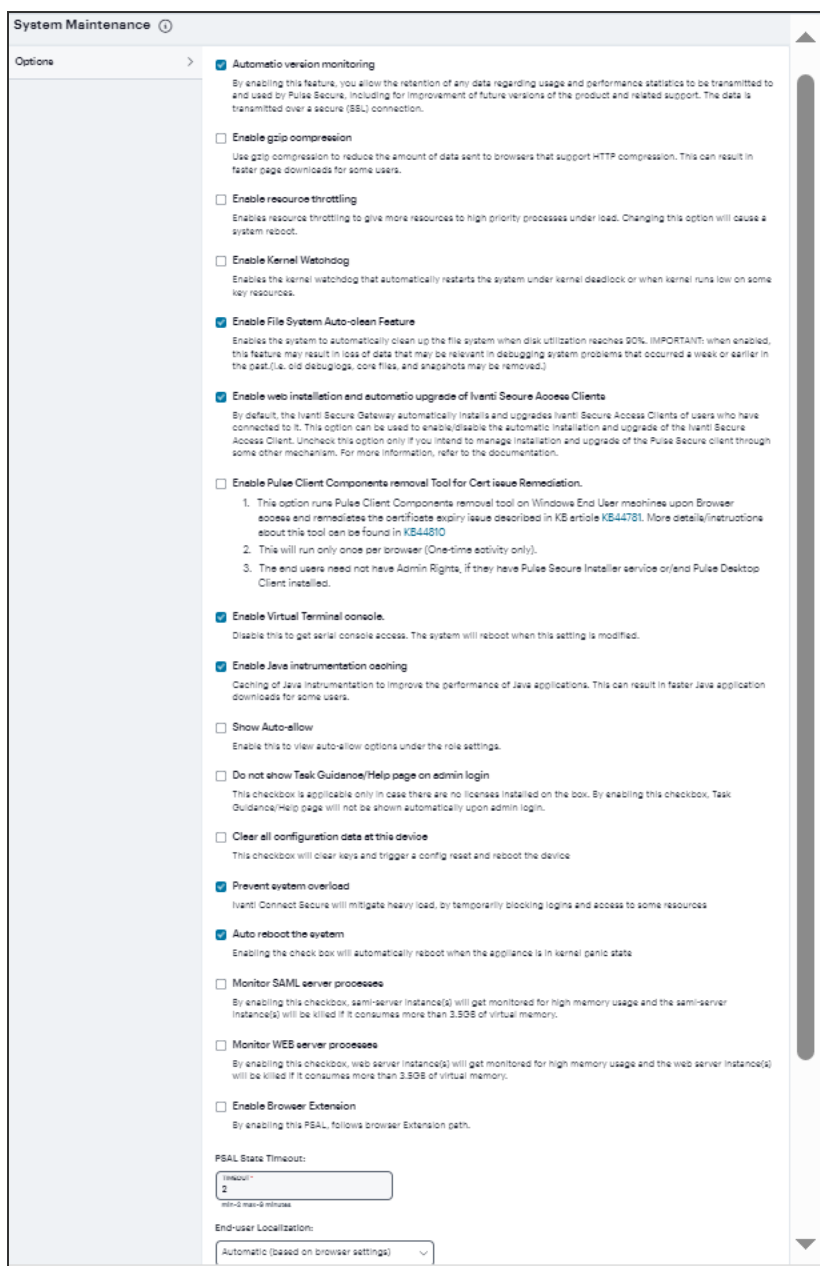

Configuration File Administration

Configuring System Maintenance Options

You can use the maintenance options page to enable various system maintenance features.

To enable various system maintenance features:

1. Select **Maintenance > System > Options** to display the maintenance options page.

System Maintenance ⓘ

Options >

- ☒ **Automatic version monitoring**
By enabling this feature, you allow the retention of any data regarding usage and performance statistics to be transmitted to and used by Pulse Secure, including for improvement of future versions of the product and related support. The data is transmitted over a secure (SSL) connection.
- ☐ **Enable gzip compression**
Use gzip compression to reduce the amount of data sent to browsers that support HTTP compression. This can result in faster page downloads for some users.
- ☐ **Enable resource throttling**
Enables resource throttling to give more resources to high priority processes under load. Changing this option will cause a system reboot.
- ☐ **Enable Kernel Watchdog**
Enables the kernel watchdog that automatically restarts the system under kernel deadlock or when kernel runs low on some key resources.
- ☒ **Enable File System Auto-clean Feature**
Enables the system to automatically clean up the file system when disk utilization reaches 90%. (IMPORTANT: when enabled, this feature may result in loss of data that may be relevant in debugging system problems that occurred a week or earlier in the past (i.e. old debuglogs, core files, and snapshots may be removed.)
- ☒ **Enable web installation and automatic upgrade of Ivanti Secure Access Clients**
By default, the Ivanti Secure Gateway automatically installs and upgrades Ivanti Secure Access Clients of users who have connected to it. This option can be used to enable/disable the automatic installation and upgrade of the Ivanti Secure Access Client. Uncheck this option only if you intend to manage installation and upgrade of the Pulse Secure client through some other mechanism. For more information, refer to the documentation.
- ☐ **Enable Pulse Client Components removal Tool for Cert issue Remediation.**
 1. This option runs Pulse Client Components removal tool on Windows End User machines upon Browser access and remediates the certificate expiry issue described in KB article KB44781. More details/instructions about this tool can be found in KB44810
 2. This will run only once per browser (One-time activity only).
 3. The end users need not have Admin Rights, if they have Pulse Secure Installer service or/and Pulse Desktop Client installed.
- ☒ **Enable Virtual Terminal console.**
Disable this to get serial console access. The system will reboot when this setting is modified.
- ☒ **Enable Java instrumentation caching**
Caching of Java instrumentation to improve the performance of Java applications. This can result in faster Java application downloads for some users.
- ☐ **Show Auto-slow**
Enable this to view auto-slow options under the role settings.
- ☐ **Do not show Task Guidance/Help page on admin login**
This checkbox is applicable only in case there are no licenses installed on the box. By enabling this checkbox, Task Guidance/Help page will not be shown automatically upon admin login.
- ☐ **Clear all configuration data at this device**
This checkbox will clear keys and trigger a config reset and reboot the device
- ☒ **Prevent system overload**
Ivanti Connect Secure will mitigate heavy load, by temporarily blocking logins and access to some resources
- ☒ **Auto reboot the system**
Enabling the check box will automatically reboot when the appliance is in kernel panic state
- ☐ **Monitor SAML server processes**
By enabling this checkbox, saml-server instance(s) will get monitored for high memory usage and the saml-server instance(s) will be killed if it consumes more than 3.5GB of virtual memory.
- ☐ **Monitor WEB server processes**
By enabling this checkbox, web server instance(s) will get monitored for high memory usage and the web server instance(s) will be killed if it consumes more than 3.5GB of virtual memory.
- ☐ **Enable Browser Extension**
By enabling this PSAL, follows browser Extension path.

PSAL State Timeout:

min-2 max-60 minutes

End-user Localization:

2. Select options as described in the following table.
3. Save the configuration.

The following table lists the System Maintenance Options Configuration GuidelinesE:

Options	Guidelines
Automatic version monitoring	<p>If you enable this option, the system reports to Ivanti the following data:</p> <p>Machine identifier.</p> <p>Information describing your current software, including:</p> <p>Software build number and build name.</p> <p>An MD5 hash of your license settings.</p> <p>An MD5 hash of the internal interface IP address.</p> <p>If this node is in a cluster, the number of nodes within that cluster.</p> <p>Current state of the node.</p> <p>Cluster type (active/active, active/passive).</p> <p>Total number of unique subnets on the cluster nodes.</p> <p>Version of Ivanti Secure Access Client.</p> <p>Version of ESAP.</p> <p>Cluster log synchronization status.</p> <p>Total number of concurrent users on the device.</p> <p>Number of Ivanti tunnels.</p> <p>We strongly recommend that you enable this service.</p>
Enable gzip compression	<p>Connect Secure only. Use gzip compression to reduce the amount of data sent to browsers that support HTTP compression. This can result in faster page downloads for some users.</p>
Enable Kernel Watchdog	<p>Enables the kernel watchdog that automatically restarts the system under kernel deadlock or when kernel runs low on some key resources.</p> <p>Enable the kernel watchdog only when instructed by Technical Support.</p>
Enable resource throttling	<p>Enables system resource throttling in the system that gives system processes higher priority. High priority processes will get high resources under system load. Changing this option will cause a system reboot.</p>
Enable File System Auto-clean Feature	<p>Enables the system to automatically clean up the file system when disk utilization reaches 90%.</p> <p>The clean-up operation deletes files that might be relevant in debugging- for example, debug logs, core files, and snapshots might be deleted.</p>

Options	Guidelines
Enable Web installation and automatic upgrade of Ivanti Secure Access Client	<p>After you deploy Ivanti Secure Access Client software to endpoints, software updates occur automatically. A Ivanti Secure Access Client can receive updates from the server. If you upgrade the Ivanti software on your Ivanti server, updated software components are pushed to a client the next time it connects.</p> <p>A bound endpoint receives connection set options and connections from its binding server, but it can have its Ivanti Secure Access Client software upgraded from any Ivanti server that has the automatic upgrade option enabled. During a client software upgrade the client loses connectivity temporarily.</p>
Enable Ivanti Secure Access Client Components removal Tool for Cert issue Remediation	Provides an option for the Admin to enable users to download the Ivanti Secure Access Client Components removal (Ivanti Upgrade Helper) tool on Windows End User machines upon Browser access and remediates the certificate expiry issue. For more information, refer KB44781 and KB44810 .
Virtual Terminal console	Enables the virtual terminal on a virtual appliance. Clear this check box to use the serial console. Changing this setting will restart the system.
Java instrumentation caching	Connect Secure only. Caches the Java instrumentation to improve the performance of Java applications.
Show Auto-allow	Connect Secure only. The auto-allow option provides the means to automatically add bookmarks for a given role to an access control policy, for example, Web bookmarks with auto-allow set are added to the Web access control policy. You only use this feature if you also use Resource Policies. We recommend that you use Resource Profiles instead.
Do not show Task Guidance/Help page on admin login	This option is applicable only in case there are no licenses installed. When enabled, Task Guidance/Help page does not appear automatically upon administrator login.
Clear all configuration data at this device	This option clears all keys and triggers a configuration reset and reboots the device.
Prevent system overload	Disallows user login, user login via Ivanti Secure Access Client, HTML5 connection or connection to a web resource when the CPU load is above a certain threshold. By default, this option is disabled for ICS upgrades and enabled for new installation.

Options	Guidelines
	<p>Exception: Admin logins, DMI and inbound REST calls are not blocked due to CPU overload.</p> <p>When a login to the HTML5 connection or connection to a web resource is blocked and when a user tries to log in, the login page will display an appropriate system busy message.</p> <p>To configure log events for User Access, in the System > Log/Monitoring > User Access > Settings tab, select the System Too Busy check box. By default, this option is enabled.</p> <p>Select System > Log Monitoring > User Access > Log to view the logs.</p>
Auto reboot the system	This option automatically reboots the system when the appliance is in kernel panic state.
Monitor SAML server processes	Enabling this check box, saml-server instance(s) gets monitored for high memory usage and kills if it consumes more than 3.5GB of virtual memory.
Monitor WEB server processes	Enabling this check box, web server instance(s) gets monitored for high memory usage and kills if it consumes more than 3.5GB of virtual memory.
Enable Browser Extension	Enabling this PSAL, follows browser Extension path.
PSAL State Timeout	Specify timeout in minutes, maximum is 9 minutes and minimum is 2 minutes.
End-user Localization	<p>Select one of the following options:</p> <p>Automatic (based on browser settings)</p> <p>English (U.S.)</p> <p>Chinese (Simplified)</p> <p>Chinese (Traditional)</p> <p>French</p> <p>German</p> <p>Japanese</p> <p>Korean</p> <p>Spanish</p>
External User Records Management	

Options	Guidelines
Persistent user records limit	Specify the maximum number of user records. This feature is useful when system performance is affected due to a large number of user records. We highly recommend you consult Technical Support prior to using this feature. Deleting a user record removes all persistent cookies, SSO information, and other resources for that user. It does not remove the user record from the external or internal authentication server. If you delete a user record and that user logs back in to the authentication server, new user records are created. Records are not removed if that user is currently logged in.
Number of records to delete when the limit is exceeded	Specify a number. Older records are removed first. A user record is not deleted if that user is currently logged in.
Delete records now	Check whether the persistent user records limit has been exceeded. If it is, delete the number of user records specified in the option above.
Automatic deletion of user records periodically	Check whether the persistent user records limit will be exceeded whenever a new user record is about to be created. If true, delete the records prior to creating the user new record.

Using the Import/Export Feature for Binary System Configuration Files

This topic describes the import/export feature for binary system configuration files.

Binary System Configuration File Overview

The access management framework enables you to import and export the system and network settings using binary system configuration files. When importing a system configuration file, you can exclude the device certificate and the server's IP address or network settings from the imported information. For example, to set up multiple Ivanti Connect Secure systems behind a load balancer, import everything except for the IP address. To set up the system as a backup server, import everything except for the digital certificate and the network settings.

The binary system configuration file includes the following settings:

- Network settings

- Certificates. The system imports only device certificates, not the chains that correspond to the device certificates or trusted client CAs.
- Cluster configuration
- Licenses. When you import a configuration file that contains licenses, the system gives precedence to any existing licenses. Licenses are imported only if no licenses are currently installed.
- SNMP settings
- Sensor configuration. Sensor configurations are included in the system configuration file while sensor event policies are included in the user configuration file. To import or export all sensor-related settings, import or export both the system and user configuration files. The user configuration file, not the system configuration file, includes resource profiles, resource policies, and the local user database. To perform a complete backup, export both the system and user configuration files.
- Client-side logs. To import or export client-side logs, import or export both the system and user configuration files.
- Web proxy servers. Ivanti Connect Secure only. To export all web proxy related information, both the system and user configuration files are needed.
- Web caching options. Ivanti Connect Secure only.
- Rewriter filters. Ivanti Connect Secure only.

Exporting a Binary System Configuration File

To export a binary system configuration file:

1. Select **Maintenance > Import/Export > Import/Export Configuration** to display the configuration page.

[Export Binary System Configuration File Configuration Page - Ivanti Connect Secure](#) shows the configuration page for Ivanti Connect Secure.

2. Complete the configuration and export operation as described in [Table](#).

Export Binary System Configuration File Configuration Page - Ivanti Connect Secure

System Configuration ⓘ

Configuration >

User Accounts

Administrative Network

XML Import/Export

Export

Please note that only the active client package (which is not the Default one) will be exported as part of the binary configuration export!

To export system settings to a configuration file, click Save Config As. You can optionally password-protect this file:

Password for configuration file

Confirm Password

Save Config As...

Import

To import system settings from a configuration file, select the configuration file and which settings to bring in, and click Import Config.

Options

☐ Import Device Certificate(s)?
Note: Checking this will overwrite the existing Device Certificate(s).

Other Import Options

☐ Import everything (except Device Certificate(s))

☐ Import everything but the IP address
Preserves the IP address, netmask, default gateway, VIPs, ARPs and routes of the network interfaces on this device.
Note: Use this option only if the exported configuration file is from a standalone node.

☒ Import everything except network settings, cluster settings and licenses
Leaves everything in Network Settings, Clustering Properties, Licensing sections and Onboarding Profile UUID unchanged.
Note: Always use this option if configuration file was exported from a node that is part of a cluster.

☐ Import only Device Certificate(s)
Imports the Device Certificate(s) only.
Note: You must check the Import Device Certificate(s) checkbox above.

CONFIG FILE

Password
Use this if the configuration file was password-protected

Note that importing configuration with a different SSL acceleration setting will reboot the IVE.

The following table lists the Export Binary System Configuration File Configuration and Action Guidelines:

Settings	Guidelines
Password for configuration file	Specify a password to encrypt and secure the configuration file. Password must adhere to the Ivanti password policy.

Copyright © 2025, Ivanti, Inc. All Rights Reserved. [Privacy and Legal](#).

Page 498 of 588

Settings	Guidelines
Confirm password	Confirm the password by reentering the same password.
Save Config As	Display a dialog box to save the file to your local host.

Importing a Binary System Configuration File

To import a binary system configuration file:

1. Select **Maintenance > Import/Export > Import/Export Configuration** to display the configuration page.
2. Complete the configuration and import operation as described in the following table.

The following table lists the Import Binary System Configuration File Configuration and Action Guidelines:

Settings	Guidelines
Options	
Import Device Certificate(s)?	Overwrite the existing device certificate(s) with the ones in the imported configuration file. When importing a device certificate in to a FIPS device, note that you must choose a certificate that uses a FIPS-compliant private key. To ensure FIPS-compliance, select a certificate and corresponding security world private keys were generated on a FIPS device.
Other Import Options	
Import everything (except Device Certificate(s))	Import all settings except the device certificate.
Import everything but the IP address	Do not overwrite the existing configuration for network interface IP addresses, netmask, default gateway, virtual interfaces, ARP tables, and route tables. Use this option only if the exported configuration file is from a standalone node. <i>To set up multiple nodes in a cluster behind a load balancer, import everything except the IP address.</i>

Settings	Guidelines
Import everything except network settings, cluster settings, and licenses	Do not allow the imported configuration to change the existing configuration for settings found in the Network Settings and Licensing sections. With this option, network configurations, licenses, cluster configurations, certificates, defined SNMP settings and syslog configurations are not imported. Always use this option if configuration file was exported from a node that is part of a cluster. <i>To set up a backup node, import everything except network settings and digital certificates.</i>
Import only Device Certificate(s)	Import the device certificate(s) only. You must also select the Import Device Certificate(s) check box.
Config file	Use the browse button to locate and select the file from your local host.
Password	Specify the password (if applicable).
Import Config	Import the configuration file.

After importing the binary configuration in ICS Gateway, you must re-register the Gateway with nSA. For reregistration, See ["Reregistration of ICS Gateway" on page 37.](#)

Using the Import/Export Feature for Binary User Configuration Files

This topic describes the import/export feature for user configuration binary files.

Binary User Configuration File Overview

In general, if a menu item falls under the Authentication, Administration, or Users menu, the item is included in the user configuration file (user.cfg). The exception is Sensors event policies, which are under System, but which are exported in the user configuration file. In particular, the user configuration file includes the following settings:

- Sign-in settings (includes sign-in policies, sign-in pages, all authentication servers, authentication protocol sets, and Ivanti settings)
- Authentication realms (including admin realms, user realms, and MAC authentication realms)
- Roles

- Resource profiles. Ivanti Connect Secure only.
- Resource policies
- Sensor event policies
- User accounts
- Client-side logs. To export or import client-side logs, export or import both the system and user configuration files.

Exporting a Binary User Configuration File

To export a binary user configuration file:

1. Select **Maintenance > Import/Export > Import/Export Users** to display the configuration page.

[Binary Export User Configuration File Configuration Page - Ivanti Connect Secure](#) shows the configuration page for Ivanti Connect Secure.

2. Complete the configuration and export operation as described in [Table](#).

Import

Import user settings by selecting the configuration file and clicking Import Config. Import User Account will invalidate all existing End-User and Administrators sessions.

CONFIG FILE

Password

Use this if the configuration file was password-protected

Import Config

The following table lists the Binary Export User Configuration File Configuration and Action Guidelines:

Settings	Guidelines
Password for configuration file	(Optional) Specify a password to encrypt and secure the configuration file. Password must adhere to the Ivanti password policy.
Confirm password	Confirm the password by reentering the same password.
Save Config As	Display a dialog box to save the file to your local host.

Importing a Binary User Configuration File

To import a binary user configuration file:

1. Select **Maintenance > Import/Export > Import/Export Users** to display the configuration page.
2. Complete the configuration and import operation as described in the following table.

Import User Configuration Binary File Configuration Page

The following table lists the Import Binary User Configuration File Configuration and Action Guidelines:

Settings	Guidelines
Config file	Locate and select the file from your local host.
Password	Specify the password (if applicable).
Import Config	Import the configuration file.

 After importing the binary configuration in ICS Gateway, you must re-register the Gateway with nSA. For reregistration, See ["Reregistration of ICS Gateway" on page 37](#).

Using the Import/Export Feature for XML Configuration Files

This topic describes the import/export feature for XML configuration files.

XML Configuration File Overview

The system maintains its configuration in a structured XML file. This enables the system to support an alternative to the complete configurations that are exported and imported with the configuration binary files. You can use the export/import configuration XML pages to export and import selected configuration elements.

You might find the feature useful when performing the following tasks:

- Adding to the configurations of peer nodes, for example, adding a large number of users.
- Modifying multiple instances of a single setting, for example, an authentication server name.
- Deleting settings, for example, deleting authentication servers that are no longer used.
- Creating a configuration template to use for setting up new nodes.
- Tracking configuration changes by comparing differences on periodic exports.

Guidelines and Limitations

The following table summarizes the guidelines and limitations for using the XML import/export feature.

The following table lists the XML Import/Export Guidelines and Limitations:

Category	Guidelines and Limitations
General	<p>The following guidelines and limitations apply:</p> <p>You can import and export configuration files only between systems running the same software version.</p> <p>If XML configuration to be imported contains one or more Ivanti Secure Access Client packages, we recommend to split the configuration to import only Ivanti Secure Access Client packages first considering one Ivanti Secure Access Client package per import and then import the remaining configurations.</p> <p>You might find it useful to use a text editor to modify configuration elements that ought to be distinguished, such as configuration object names and descriptions. Never modify the names of the NIC identifiers. The system relies on knowing that each appliance has two interface cards, known as NIC0 and NIC1.</p> <p>Immediately after importing an Active Directory authentication server configuration, you must edit the configuration to change the Computer Object name. Unexpected problems might arise if two systems join an Active Directory domain using the same Computer Object name.</p>
Licenses	<p>The following rules apply to exported and imported licenses:</p> <p>You cannot edit the license data that is exported. It is encrypted.</p> <p>An XML import of licenses is valid only if the system does not currently have a license installed. If a license is installed already, any imported licenses are dropped. If you still intend to import a license, you must perform a factory reset before you perform the import operation.</p> <p>If you import a license after deleting a temporary license, the imported license is dropped because you might still be able to reactivate the deleted license. The import operation preserves any licensing data.</p>

Category	Guidelines and Limitations
Clusters	<p>The following guidelines apply to importing a configuration file for nodes that belong to a cluster:</p> <p>When you perform an import operation on a cluster, all of the cluster nodes must be enabled and running. If you attempt to import a configuration into a cluster in which a node is not running, the import operation might hang or your import results might be unpredictable.</p> <p>The XML configuration that you import must contain the same set of nodes as the original cluster. The signature used to synchronize the cluster when the nodes are reenabled is derived from the IP addresses of the cluster nodes. Therefore, the remaining nodes cannot rejoin the cluster if the imported configuration yields a different signature.</p> <p>When import occurs, the imported configuration file overwrites the node-specific cluster configuration network settings of the remaining nodes. If you change the node-specific network settings, make sure you do not make the remaining nodes unreachable.</p> <p>After you have exported the file, do not modify settings that could render the primary node unreachable, such as changes to network settings.</p> <p>After you have exported the file, do not modify the XML to change the node name, IP address, or IP netmask.</p> <p>After you have exported the file, do not modify virtual port settings or add new virtual port settings.</p>

Exporting an XML Configuration File

To export an XML configuration file:

1. Select **Maintenance > Import/Export > Export XML** to display the configuration page.

[Export XML File Configuration Page - Ivanti Connect Secure](#) shows the configuration page for Ivanti Connect Secure.

2. Complete the configuration and export operation as described in [Table](#).

The following table lists the Exporting an XML Configuration File settings and guidelines:

Settings	Guidelines
Select Settings and Export	
Expand All	Expand the display of all settings groups.
Select All	Select all settings for all groups.
Export	Export the selected configuration data to an XML file.
System Settings	Expand this group and select settings found under the System menu. Do not select the DMI Agent unless Technical Support instructs you to do so.
Sign-in Settings	Expand this group and select settings found under the Sign-in menu.

Settings	Guidelines
Endpoint Security	Expand this group and select settings found under the Endpoint Security menu. ESAP packages are encrypted when exported.
Authentication Realms	Expand this group and select authentication realm settings, including user realms and MAC address authentication realms.
Roles	Expand this group and select settings found under the Roles menu.
Resource Profiles	Ivanti Connect Secure only. Expand this group and select settings found under the Resource Profiles menu.
Resource Policies	Expand this group and select settings resource policies settings.
Ivanti Secure Access Client	Expand this group and select settings found under the client menu.
Local User Accounts	Expand this group and select local authentication server settings.
Maintenance	Expand this group and select settings found under the Maintenance menu.
Password for configuration file	(Optional, but recommended) Specify a password to encrypt and secure the configuration file. Password must adhere to the password policy as per default Administrators Auth server page.
Confirm password	Confirm password by reentering the same password.
Export	Export the selected configuration data to an XML file. The following confirmation prompt is displayed if user proceeds without password: "Are you sure you want to proceed with exporting the configuration without a password"

Importing an XML Configuration File

To import an XML configuration file:

1. Select **Maintenance > Import/Export > Import XML** to display the configuration page.

Figure underneath shows the configuration page for Ivanti Connect Secure.

2. Complete the configuration and import operation as described in [Table](#).

Import XML File Configuration Page

XML Import/Export >

Import Data
To import data, select a valid XML data file, then click Import. During the import process, all members of a cluster are disabled and all end-user sessions are terminated. After the import process completes, the cluster members are automatically enabled but users must sign-in again. Note: XML import doesn't support modifying Clustering Properties. Please use binary import option #1 for that instead.

XML DATA FILE

Password for the Import File Use this if the configuration file was password-protected

Import

The following table lists the Import XML File Configuration and Action Guidelines:

Settings	Guidelines
XML data file	Locate and select the XML file.
Password for the Import File	Provide the password if the configuration file was password protected. If the exported XML do not have any secure elements, the passwords given during export or import do not play any role. Consequently, without secure elements, the import will succeed even if incorrect or no passwords are provided.
Import	Import the file. The Import XML Results page is displayed. This page contains information about the imported network settings, roles, resource policies, and other settings. If there are errors in the XML, the import operation stops and rolls back the configuration to the previous state. Error messages are displayed on the Import XML Results page.

Archiving Servers

You can schedule periodic archiving for system logs, system configuration files, and system snapshots. Periodic archiving occurs only at the scheduled time. "Unscheduled" archiving does not occur automatically.

To configure log archiving:

1. In the **Maintenance > Archiving > Archiving Servers** page, select **Method** from the drop-down list.

Archiving Servers ⓘ

5. Select the required **Archive Schedule** options.
6. Click **Save Changes**.

Using Enterprise Integration to Export Your Logs for External Analysis

- [Introduction and Prerequisites](#)
- [Importing a Trusted Server CA Certificate](#)
- [Adding a Client Certificate to the Controller](#)
- [Adding a Public Syslog Server to the Controller](#)
- "White-listing Required IP Addresses for your Services" on page 524

Introduction and Prerequisites

Ivanti Neurons for Secure Access (nSA) gathers data for events that occur on your ICS Gateways and from the nSA's Authentication, Authorization and Accounting (AAA) service. These events are categorized and stored in the following log files:

- Access Logs
- Admin Logs
- Event Logs
- Tenant Admin Audit Logs

nSA enables you to configure external syslog server to forward ICS Gateway logs and nSA Tenant Admin logs. You can view and obtain these logs at any time through the nSA Tenant Admin Portal (for details, see "[Checking the Logs](#)" on page 118).

nSA enables you to automatically export log data for analysis in an external third-party enterprise analytics or visualizer tool through Enterprise Integration. This enables enhanced visibility into the health and efficiency of the services running in your ICS Gateways, or to facilitate debugging in the event of unexpected service behavior.

To receive the log data exported from ICS Gateway, your analytics endpoint should employ a syslog service that supports ingestion of data in JSON or WELF format. Syslog is a protocol defined through RFC 5424, and nSA supports exporting log data to any Security Information and Event Management (SIEM) system that can accept and parse syslog messages. Supported configurations are:

- A publicly-reachable syslog server for your nSA. This requires you to configure nSA with the hostname or IP address and port on which the analytics service is listening, and with the client certificate to use to authenticate nSA to the syslog service.

nSA exports log data at 30 minutes intervals. Syslog forwarding is not real-time.

- An on-prem syslog server for your ICS Gateway(s). This requires you to configure ICS Gateway with the hostname or IP address and port on which the analytics service is listening, and with the required protocol for the syslog service. In this case, syslog forwarding is real-time.

To use this facility, you must:

- Obtain and import a trusted Server Certificate Authority (CA) certificate suitable for the analytics service, see [Importing a Trusted Server CA Certificate](#).
- Obtain and import a client authentication certificate for nSA, see [Adding a Client Certificate to the Controller](#).

A client certificate is not required for an on-prem syslog server.

- Configure nSA with the details of your publicly-reachable syslog server, see [Adding a Public Syslog Server to nSA](#).

Importing a Trusted Server CA Certificate

To export your logs to an analytics service, you first need to add a certificate for a Trusted Server Certificate Authority (Server CA).

Make sure you have a suitable certificate file, in PEM (Base64 ASCII encoded) format, stored on your local workstation before starting this procedure.

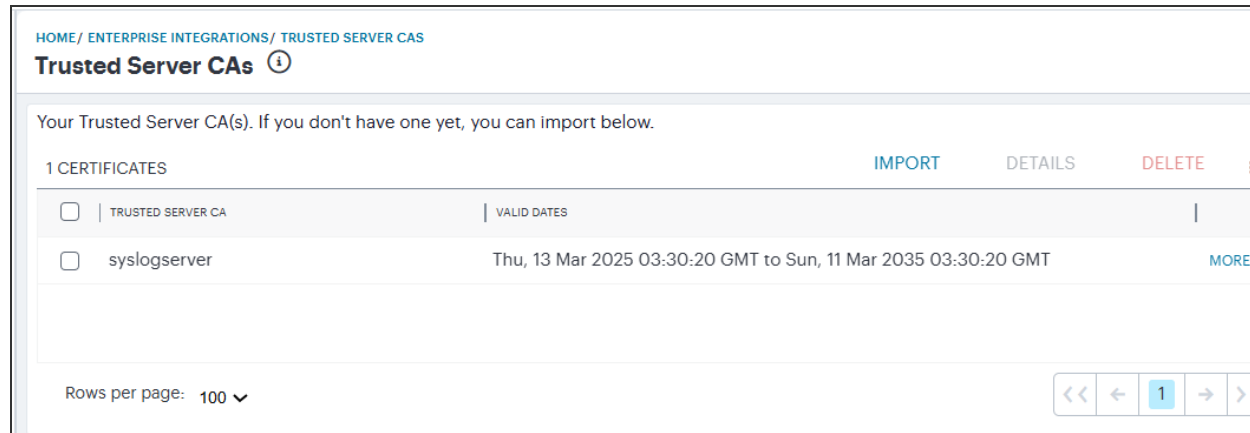

nSA supports certificate files in PEM format only. Other formats, such as PFX, are not currently supported.

To import a certificate for a trusted server CA:

1. Log into the nSA as a Tenant Admin, see ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).

- From the Ivanti Connect Secure menu, select **Integrations**, then select **Enterprise Integrations > Trusted Server CA**.

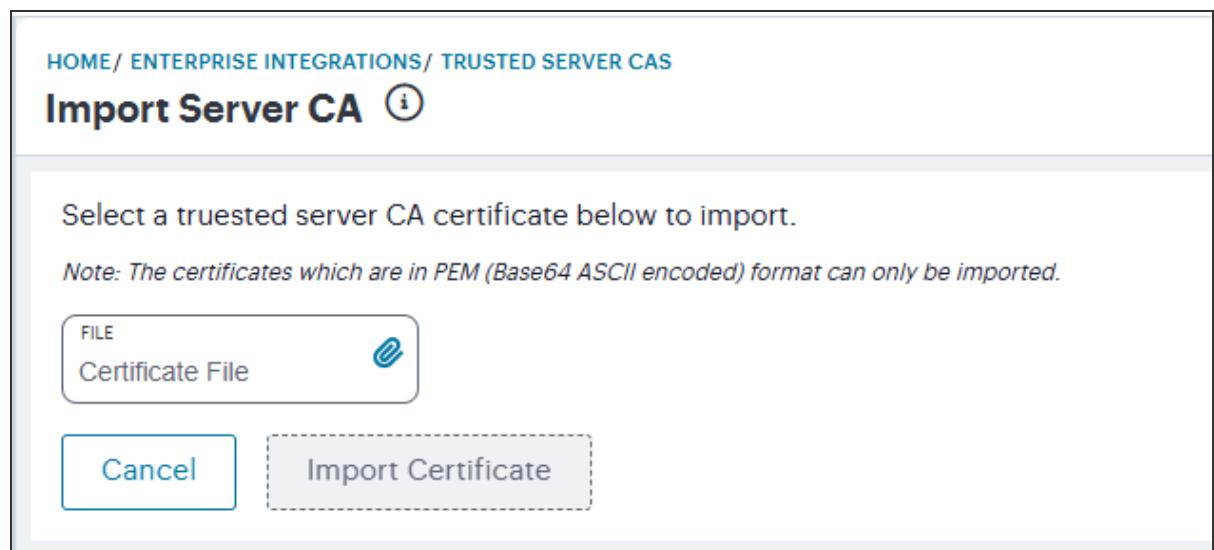

The Server CAs page appears.

Viewing Trusted Server CA certificates

- To import a Server CA certificate, click **Import**.

The Import Server CA page appears.

Importing a Trusted Server CA certificate

- Click **Certificate File** and use the subsequent dialog to locate the certificate file from your local workstation file system.

5. To import the selected certificate, click **Import Certificate**.

The Trusted Server CAs page appears showing the successfully imported certificate.

6. (Optional) To view the details stored in a certificate, select the certificate check box and click **Details**.
7. (Optional) To delete a certificate, select the certificate check box and click **Delete**.

You can import more than one trusted server CA certificate.

After you have imported your trusted server CA certificate to the *Controller*, proceed to add your client certificate (see [Adding a Client Certificate to nSA](#)).

Adding a Client Certificate to nSA

Before you can export your logs to an analytics service, you must add a client certificate to verify the identity of nSA to the external service.

A client certificate is not required for an on-prem syslog server.

Make sure you have a suitable client certificate file, in PEM (Base64 ASCII encoded) format, stored on your local workstation before starting this procedure.

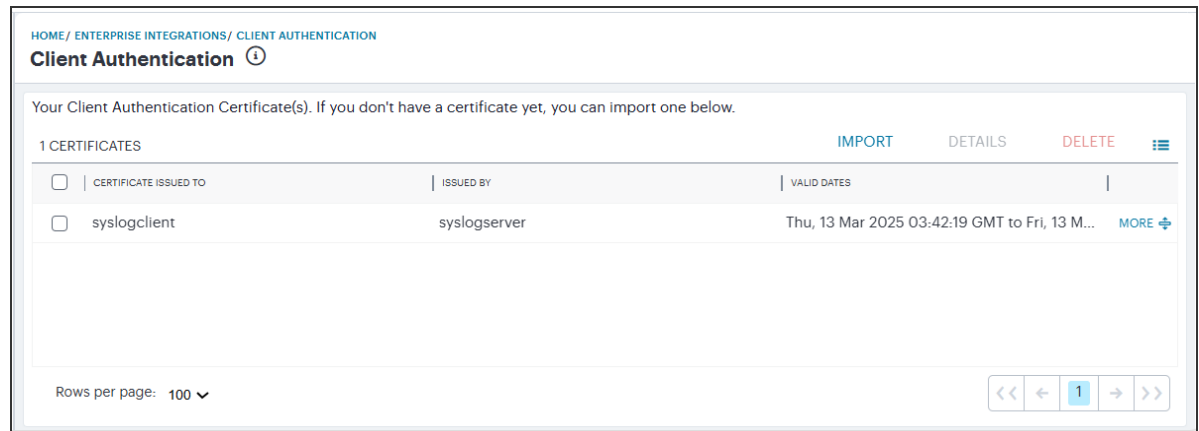

nSA supports certificate files in PEM format only. Other formats, such as PFX, are not currently supported.

To import a client certificate:

1. Log into nSA as a Tenant Admin, see [Logging in as a Tenant Administrator](#).
2. From the Ivanti Connect Secure menu, select **Integrations**, then select **Enterprise Integrations > Client Authentication**.

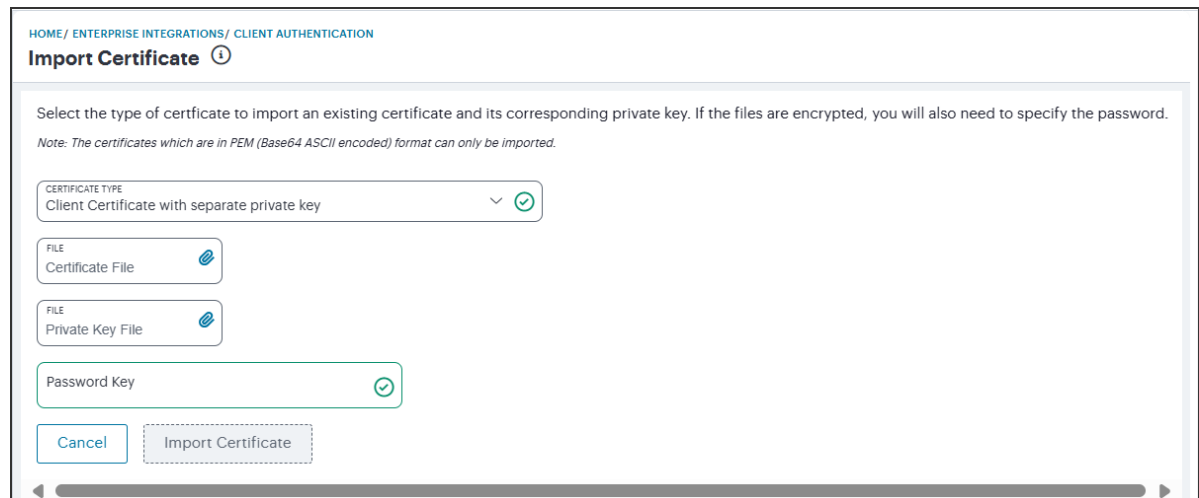

The Client Authentication page appears.

Viewing Client Authentication Certificates

3. To import a client certificate, click **Import**.

The *Import Certificate* page appears.

Importing a Client certificate

4. Click **Certificate Type** and select one of the following options:

- **Client Certificate with embedded private key:** Use this option if you are importing a certificate file with an embedded private key.
- **Client Certificate with separate private key:** Use this option if you are importing a certificate file with a separate private key file.

nSA updates the page to show the relevant import fields based on your selected option.

5. Click **Certificate File** and use the subsequent dialog to locate the certificate file from your local workstation file system.
6. (Optional) If you selected to use a separate private key, click **Private Key File** and use the subsequent dialog to locate the private key file from your local workstation file system.
7. (Optional) For **Password Key**, enter your private key passphrase.
8. To import the selected client certificate, click **Import Certificate**.

The Client Authentication page appears showing the successfully imported client certificate.

9. (Optional) To view the details stored in a certificate, select the certificate checkbox and click **Details**.
10. (Optional) To delete a certificate, select the certificate checkbox and click **Delete**.

You can import more than one client certificate.

After you have imported your Trusted Server CA certificate and Client certificate to nSA, proceed to add the details of your external analytics service (see [Adding a Public Syslog Server to nSA](#)).

Adding a Public Syslog Server to nSA

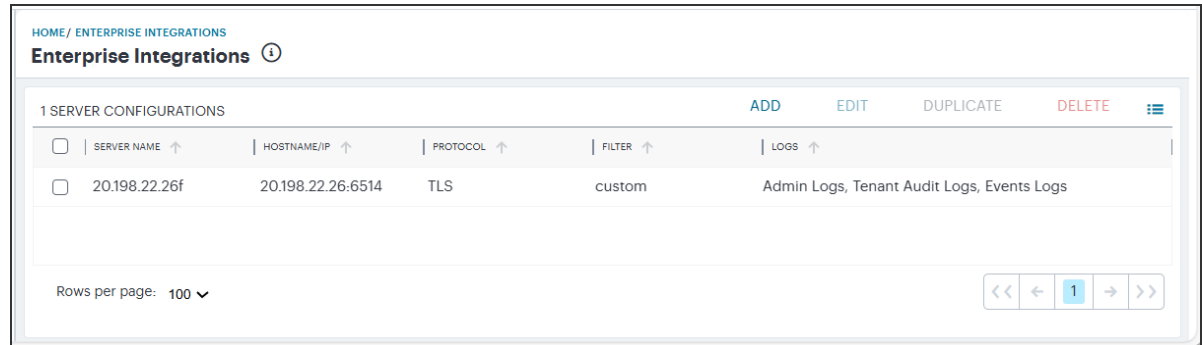

Before you configure a publicly-reachable syslog server on nSA, ensure that:

- Your syslog server is publicly-reachable, and that you know the hostname or IP address and port of the service.
- You have already added suitable Server CA and Client certificates.

To configure a syslog server in nSA:

1. Log into nSA as a Tenant Admin, see [Logging in as a Tenant Administrator](#).
2. From the Ivanti Connect Secure menu, select **Integrations**, then select **Enterprise Integrations** > **Syslog Servers**.

The Enterprise Integrations page appears.

The screenshot shows the 'Enterprise Integrations' page. At the top, there's a breadcrumb 'HOME / ENTERPRISE INTEGRATIONS' and a title 'Enterprise Integrations' with an info icon. Below the title, there are buttons: 'ADD', 'EDIT', 'DUPLICATE', and 'DELETE'. A table titled '1 SERVER CONFIGURATIONS' contains one row with columns: 'SERVER NAME', 'HOSTNAME/IP', 'PROTOCOL', 'FILTER', and 'LOGS'. The row data is: '20.198.22.26f', '20.198.22.26.6514', 'TLS', 'custom', and 'Admin Logs, Tenant Audit Logs, Events Logs'. At the bottom, there's a 'Rows per page: 100' dropdown and a pagination control showing '1'.

Cancel Back Next Reset Save Changes

Add a new Syslog Server configuration

5. Enter data for the following fields:

- **Server Name:** An identifying name for this syslog server configuration. The server's name must match the CN in the subject DN in the certificate obtained from the server.
- **Facility:** The syslog facility level *nSA* should use while exporting log data. Facility level allows to logically separate syslog messages. Local0 to Local7 allow admin to define log categories specific to your business operations or applications.
- **Hostname or IP:** The hostname or IP address of the syslog server. This must match the value contained in the *Subject Alternative Name* specified in the Server CA certificate applicable to this configuration.
- **Port:** The port on which the syslog server is listening.
- **Protocol:** *This field is read-only.* *nSA* supports only the TLS protocol in this instance.
- **Client Certificate:** The client certificate you want to use with this syslog server.

6. Specify or create a **Custom Filter** to select the log data sent to the syslog server. Choose from:

- Use either of the predefined "JSON" or "WELF" filters. These do not place restrictions on the log data and forward all logs to the external syslog server, using the respective data format.
- Create your own filter, based on log parameter rules you define yourself, see [Setting a Custom Syslog Filter](#).

The predefined JSON and WELF filters are fixed and cannot be updated or deleted.

- Click **Next** to select the required log files.

The *Selected Logs* tab appears.

HOME / ENTERPRISE INTEGRATIONS

Add New Configuration ⓘ

Configuration **Selected Logs**

Available Logs 1

☐ Select All

☐ Access Logs

Selected Logs 3

☐ Select All

☐ Admin Logs

☐ Events Logs

☐ Tenant Audit Logs

Cancel Back Next Reset **Save Changes**

Select the logs to be exported

- From the list of *Available Logs*, select the check box adjacent to the desired log and click the arrow to move it to the *Selected Logs* list.

Repeat this step for each log you want to include. Use the reverse process to remove included logs.

- To create a syslog server configuration with the current settings, click **Save Changes**.

When a syslog server is configured for the **first** time on a tenant, the system forwards logs from the past 15 minutes as part of the initial setup. Post that it follows 30-minute schedule.

Optionally:

- To edit an existing syslog server configuration, select the check box adjacent to the configuration entry and click **Edit**.

- To duplicate an existing syslog server configuration, select the check box adjacent to the configuration entry and click **Duplicate**. This creates a complete copy of the chosen configuration using the same server name appended with "-copy".
- To delete an existing syslog server configuration, select the check box adjacent to the configuration entry and click **Delete**.

Setting a Custom Syslog Filter

nSA enables you to create a custom filter that builds a query to specify the data items exported to your syslog server. You can specify criteria based on matching log data fields, date selection, and log output format.

This procedure assumes you are in the process of creating or editing a syslog server configuration. To learn more, see [Adding a Public Syslog Server to the Controller](#).

To add a custom syslog filter:

1. From the *Add New Configuration* page, locate the *Custom Filters* section and click **Add**.

The *Custom Filter* dialog appears.

Setting a custom syslog filter

2. Use **Select existing or create new filter** to either:
 - Create a new filter from scratch.
 - Select an existing filter as a template. This option pre-populates the **Expression** and **Format String** fields with values used in the selected filter, which you can then use to create your new filter.
3. Enter a **Filter Name**.

4. Select a **Start Date** and **End Date** for the log data to be included. Use the default *Earliest* and *Latest* values to include all data, or select custom start and end dates, or a combination.

- nSA stores log data for the previous 30 days.
 - Logs are forwarded in 30-minute intervals, with each job processing logs generated in the last 30 minutes.
 - Syslog forwarding is not real-time.
-

5. (Optional) To use this filter as the default for your Syslog Server configurations, select **Default Filter**.
6. (Optional) Select from the list of available log data **Variables**, select an **Operator**, and then click **Add Variable** to add a filter based on the chosen value.

nSA populates the **Expression** field with an expression matching your selection. An example *value* is added to the right of the operator, but this can be freely edited to your required value. Validate the expression by clicking **Validate Expression**.

Hover your pointer over the (i) icon to the right of each variable to view a tooltip showing example usage.

Examples of valid query expression:

- valid: user = "John Doe" AND realm = "Users"

invalid: user = "John" realm = "Users"

- valid: severity = "MAJOR" OR user = "John Doe" AND NOT realm = "Users"

invalid: severity = "MAJOR" OR invalid = 1

Valid expression: (sourceip = "1.1.1.1" AND id = "ADM32324" AND severitycode = 1 AND user = "user1") AND gatewayName = "fz55"

7. (Optional) Repeat the previous step as required for each log data variable you want to include in the syslog filter.
8. Select an output **Format** for the log line. Choose from JSON or WELF. The resultant formatted string is shown in the box provided.
9. To save your filter settings, click **Save Changes**.

The Add New Configuration screen appears, showing your new filter as selected. Continue to create your syslog server configuration.

White-listing Required IP Addresses for your Services

The controller service uses a series of IP addresses and ports to facilitate access to the admin and user web consoles, for user enrollment, and for connections to a ICS Gateway. To ensure network access, make sure the following IP addresses and ports are white-listed (or added to the *allowed list*) in your network firewalls and routing infrastructure. Select the IP addresses and ports for your corresponding region only:

- **North America:**

52.186.44.249 (port 443)

52.188.33.186 (port 443)

- **Europe:**

51.138.111.17 (port 443)

20.50.150.82 (port 443)

- **APJ:**

20.44.238.229 (port 443)

20.44.237.67 (port 443)

- **UAE**

20.233.40.108 (port 443)

20.233.41.69 (port 443)

- **Canada:**

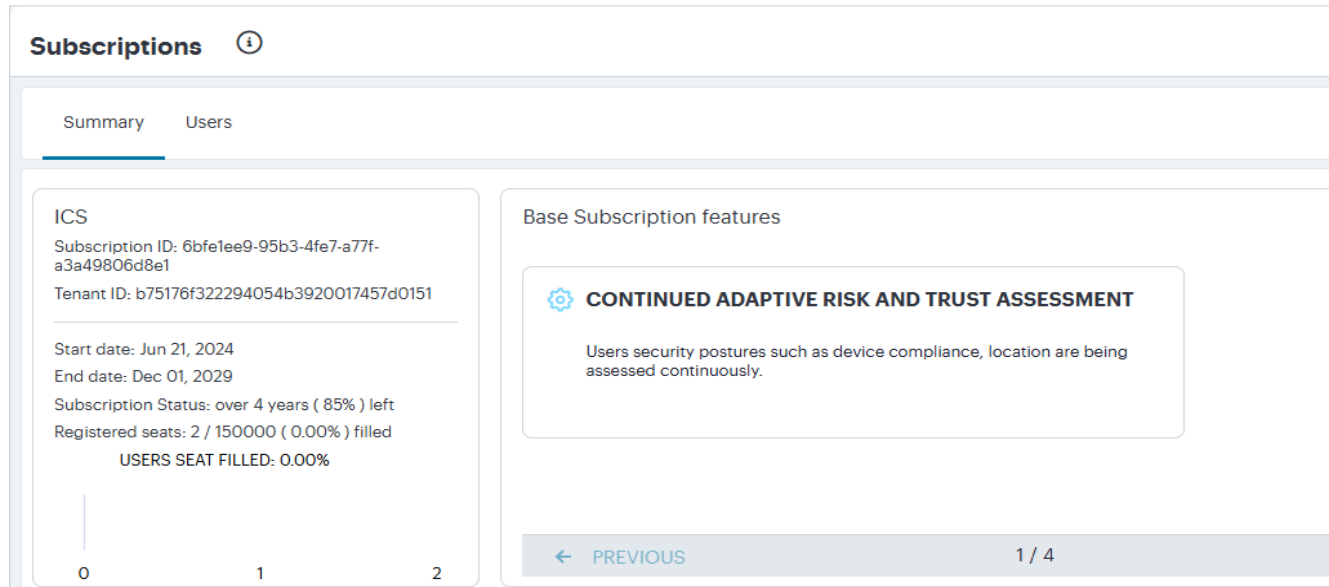

20.220.157.85 (port 443)

20.220.157.158 (port 443)

nSA Licensing/Subscription

Licenses/subscriptions are added to your nSA by Ivanti.

The **Subscriptions** page displays the licenses/subscriptions that are active on your nSA. To access this page, click **Administration > Subscriptions**.

The **Summary** tab displays for each subscription/license:

- License/Subscription high-level details, including dates and usage metrics.
- One or more descriptions of the features in the license/subscription. Where there are multiple features, use **Previous** / **Next** to navigate.

When any defined limit on the license/subscription is met, a message appears:

- At 75% utilization of seats, an information message appears at the bottom of the screen. You can optionally click **Close**.
- At 90% utilization of seats, a modal message appears at login. Click **Dismiss** to clear the message.
- When 25% of the duration of the license/subscription remains, a modal message appears at login. Click **Dismiss** to clear the message.

The **Users** page lists users and their devices registered on nSA.

Named User Licensing Normalization

nSA named user licensing normalization feature allows a user to use different login formats - Domain\username, Common Name (CN), and User Principal Name (UPN) - from different devices, but consumes only one seat for the user. Single license is consumed instead of two through associating devices with users for Machine Cert Authentication and subsequent User Authentication. This feature is supported only for ICS 22.6R2 Gateway with ISAC 22.6R1 Client and later versions.

Device to User Normalization

When a device logs into an ICS Gateway, gateway checks if device entry exists in the local gateway cache.

- If device entry exists in gateway cache, device login is successful. Then request will not go through nSA, but will be handled in ICS Gateway.
- If device entry does not exist in gateway cache, gateway sends request to nSA to reserve a valid license.
 - If this device login is for the first time, Device name and Device serial number are sent to nSA. This map is updated in nSA for reserving license for device first.
 - If user login is from the registered device, nSA verifies Device serial number entry mapping and recognizes an existing map for that serial number with device.

- Device serial number map is done irrespective of any gateway that user tries to log in.
 - User to device mapping from gateway is updated in nSA as part of normalization.
-

Summary information for the nSA licenses/subscriptions is displayed at the top of the page:

- Total number of seats.
- Total number of issued named user license seats. Each of these is listed in the table below the summary.
- The percentage of seats consumed.

For each named user, the following information is displayed:

- The name of the user.
- The gateways enrolled for that user.
- Updated time shows an N/A for ICS gateways.
- The status of the named user license seat of that user.

Login type	Authentication type	Subscription page User details
L3 Login	Machine Auth enabled with latest client 22.7R3-30227	Device details updated
L3 Login	Machine Auth not enabled	Device details is blank
L3 Login	User Auth enabled	Device details is blank
L7 Login	Machine Auth enabled with latest client 22.7R3-30227	Device details is blank
L7 Login	User Auth enabled	Device details is blank

You may need to remove users when there is any changes in the organization. To delete one or more named users, select the corresponding check boxes and click **Delete**.

You may want to automatically remove the license of users who have not logged-in in the last 30 days. To delete those users automatically, select the **Auto Delete** check box.

The counts in the Users page, and information in the Summary page get updated accordingly.

Grace Period Functionality for ICS Gateway

Grace period allows gateways to maintain connectivity for end users even when the nSA is temporarily unavailable. A grace period of 5 days is provided, during which new user logins can continue without interruption.

How it Works

New User Logins: Only new user license seat reservation requests are sent to the nSA.

Existing Users: Existing user sessions are managed using the local gateway cache, ensuring that they remain unaffected by nSA availability.

ICS Gateway versions prior to 22.7R2.2

The grace period is triggered based on the notification channel status:

Notification channel is Green: When the channel is reachable, the user license seat reservation request is sent to the nSA.

Notification channel is Red: When the channel is not reachable, the grace period is triggered to enable new user logins. During this time, no requests are sent to the nSA.

ICS Gateway versions 22.7R2.2 onwards

The grace period will now also be triggered if the user license seat reservation API fails. This ensures seamless operation even during temporary service disruptions, providing more robust support for user logins during such periods.

nSA Administration

- ["Introduction" below](#)
- ["Viewing Admin Authentication Methods" on the next page](#)
- ["Viewing Admin Authentication Policies" on page 531](#)
- ["Creating Admin Policies" on page 532](#)
- ["Creating Admin Rules and Admin Groups" on page 534](#)
- ["Associating Admin Groups with Admin Roles" on page 542](#)
- ["Role-based Access Control for Admin Users" on page 544](#)
- ["Workflow: Creating a Local Authentication Policy" on page 548](#)
- ["Workflow: Creating a SAML Authentication Policy With Azure AD and SAML\(Custom\)" on page 557](#)
- ["Checking Tenant Admin Logs" on page 569](#)
- ["Synchronizing the Configuration" on page 571](#)

Introduction

After you have logged into the nSA for the first time, you can create **authentication methods** and apply them to the **authentication policies** you define in your nSA deployment. You then apply an authentication policy, together with **admin rules**, to a **admin group**. A admin group forms part of a *Secure Access Policy*.

To view admin authentication methods currently defined on the nSA, see ["Viewing Admin Authentication Methods" on the next page](#). To view user authentication policies, see ["Viewing Admin Authentication Policies" on page 531](#).

This chapter includes workflows for configuring admin authentication according to each supported authentication type. nSA supports the following types:

- **Local authentication:** An authentication system that is internal to the nSA. You must create all users manually on the nSA, and update any required authentication policies. see ["Workflow: Creating a Local Authentication Policy" on page 548](#).

- **Azure AD SAML authentication:** An existing remote SAML authentication system based on an Azure AD server. See ["Workflow: Creating a SAML Authentication Policy With Azure AD and SAML\(Custom\)"](#) on page 557.
- **SMAL Custom:** An customized remote SAML authentication system based on an on-premises ICS server. See ["Workflow: Creating a SAML Authentication Policy With Azure AD and SAML \(Custom\)"](#) on page 557

After you have created the required authentication method and updated your admin authentication policies, you create admin rules and admin groups, see ["Creating Admin Rules and Admin Groups"](#) on page 534

Optionally, you can associate each admin group with an *admin role*, see ["Associating Admin Groups with Admin Roles"](#) on page 542.

Viewing Admin Authentication Methods

To view the admin authentication methods defined on the nSA, click the **Administration** icon in the nSA menu, then select **Admin Management > Authentication Servers**.

The *Authentication Servers* page appears, showing all admin authentication methods:

The screenshot shows the 'Admin Management' section with the 'Authentication Servers' tab selected. A warning message states: 'Authentication Servers which default OR linked to any Admin Policy, will be disabled from deletion. Local Authentication Servers which have one or more admins linked to them will be disabled from deletion.'

Below the warning, there is a '+ Create Authentication Server' button and a search bar. The main table shows the following data:

STATUS	NAME	DEFAULT	AUTHENTICATION METHOD	USERS
<input checked="" type="checkbox"/>	Admin Auth	<input checked="" type="checkbox"/>	Local	72 Users

Below this table, there is a section titled 'LIST OF LOCAL USERS' with 72 users found. A search bar and 'CREATE USER' button are present. The table shows the following data:

USERNAME	FULL NAME	EMAIL	CHANGE PASSWORD
<input type="checkbox"/> abhishek.dwivedi	abhishek.dwivedi	abhishek.dwivedi@ivanti.com	No
<input type="checkbox"/> admin	Dharma	dharmakumar.arumugam@ivanti.com	No
<input type="checkbox"/> admindb	admindb	surendraredy.nerusupalli@ivanti.com	No
<input type="checkbox"/> adminuser			No
<input type="checkbox"/> ajai.murthy	ajai.murthy	ajai.murthy@ivanti.com	No

At the bottom, there is a 'Rows per page: 5' dropdown and a pagination bar showing 1, 2, 3, 4, 5, and a 'Batch Delete' button.

From this page, you can:

- Add a new authentication method by clicking **Create Authentication Server**.
- Edit an existing authentication method by selecting its check box and clicking **Actions > Edit**. Make any required updates and save the changes.
- Delete an unused authentication method by selecting its check box and clicking **Actions > Delete**. You must confirm the deletion.
- View the configured attributes for a SAML authentication method, where that method is configured for use with an authentication policy. To do this, click the arrow indicator to the left of the method name, where shown.
- Use the Advanced Filter to view the list based on Name or Authentication method.

Viewing Admin Authentication Policies

To view the user authentication policies defined on the nSA, click the **Administration** icon in the nSA menu, then select **Admin Management > Admin Policies**.

The *Admin Policies* page appears, showing all user authentication policies.

Admin Management ⓘ								
Admin Groups Admin Rules <u>Admin Policies</u> Device Policies Authentication Servers								
<div>⚠ To create a Admin Policy, you need a prerequisite entity - Authentication Servers.</div> <div>Admin Policies which are default OR linked to any Admin Group will be disabled from deletion.</div>								
<div> Actions ▾ + Create Admin Policy <input type="text" value="Search"/> ? 🔍 ☰ </div>								
☑	STATUS	NAME ↑	DEFAULT ↑	POLICY USER	ACCESS URL	SERVER	SERVER TYPE	DEVICE POLICY
☑		Admin Signin	☑	admin	*/login/admin/	Admin Auth	Local	
☐		demo policy		admin	*/login/demo/	new rule	Local	demopolicy
☐		demo1		admin	*/login/demo1/	local1	Local	
☐		Documentation		admin	*/login/documentation/	Admin Auth	Local	
☐		Engineering		admin	*/login/engineering/	Admin Auth	Local	
☐		Management		admin	*/login/management/	Admin Auth	Local	
☐		PLM		admin	*/login/plm/	Admin Auth	Local	
☐		PM		admin	*/login/pm/	Admin Auth	Local	
☐		policy-test		admin	*/login/user/	auth-test	Local	
☐		SE		admin	*/login/se/	Admin Auth	Local	

nSA provides default/built-in authentication policies, suitable for the primary use-cases of administrative sign-in, user enrollment, and user sign-in:

- *Admin SignIn*. This policy is used whenever admin users log in. That is, for connection requests to the **/login/admin/* URL. It is referenced by the *ALLADMINUSERS* user rule, which associates it with the *ADMINISTRATORS* user rule group.

This policies is fixed and cannot be deleted. However, you can edit to reference a specific authentication method.

Furthermore, you can create additional custom authentication policies to enable bespoke authentication for specific groups of users or parts of your organization. Each policy should contain a unique access URL to which your users connect, and each should then be configured to link to an authentication method applicable for that purpose.

To learn more about how admin authentication policies are used in a nSA service.

From this page, you can:

- (For SAML authentication) Download policy metadata files that are required for external SAML enrollment or sign-in apps. To do this, select the check box for the required policy and click **Download**. Save the file to your local workstation.
- View the configured attributes for a SAML-authenticated policy, where that policy is configured with a valid SAML authentication method. To do this, click the arrow indicator to the left of the policy name, where shown.
- Add an authentication policy by clicking **Create Admin Policy**.
- Edit an existing authentication policy by selecting its check box and clicking **Actions > Edit**. Make any required updates and save the changes.
- Delete an unused authentication policy by selecting its check box and clicking **Actions > Delete**. You must confirm the deletion.
- Use the Advanced Filter to view the list based on Name, Server, Server Type, Device Policy, Enroll Device Policy, or Access URL.

Creating Admin Policies

You can use the existing default polices or can create new policy and use the default admin policy.

To configure Admin Policy for users:

1. From the nSA menu, click the **Administration** icon, then select **Admin Management**.
2. In the Admin Management page, select **Admin Policies**.
3. Click **Create Admin Policy**.

Manage User Policy

4. Enter the **Policy Name**, **Login URL** using the format */login/<path>.
5. Select the **User Type: Enrollment Users/ Users/Administrators**.
6. Select the **Device Policy** from the drop-down menu. For example, Deny_Location.

There are a few exceptions while creating User Policies when user Type is Administrator. The following device policies are not applicable to Administrator user.

- Any device policy having Risk Sense rule.
- Any device policy having Time of Day rule.
- Any device policy having combination of Location and Network rules.

7. Select the **Auth Server**.
8. Click **Create Admin Policy**.
9. Users can also edit the existing Default policy to include the Device policy during the enrollment sign-in/user authentication.

Cancel Update Admin Policy

Edit User Policy

10. Make required changes and click **Update Admin Policy**.

Creating Admin Rules and Admin Groups

After your authentication method is established and associated with an authentication policy, you can set up any required *admin rules* and *admin groups*. A admin rule identifies one or more admin users based on a test against a selected attribute present in a admin credential or profile, checked against either a local authentication record or from a SAML authentication service. For information about creating admin rules, see ["Creating Admin Rules" on the next page](#).

You associate one or more user rules with an *authentication policy* to form a *user group* (see ["Creating Admin Groups" on page 540](#)). Users requesting authorization for a service controlled by a Secure Access Policy must pass all the rules contained in the admin Group attached to the policy.

A admin group is required when defining a *secure access policy*. The admin group identifies the users and the authentication policy to which a secure access policy applies.

Optionally, you can associate each user group with an admin role, see ["Associating Admin Groups with Admin Roles" on page 542](#).

Creating Admin Rules

Through admin rules, an admin can construct a test to provide authorization to only those users of a particular name, role, group, or some other stored attribute. In the rule configuration, you select the admin attribute on which you want a test to be performed.

nSA includes the following default admin rule:

- **ALLADMINUSERS.** This matches all admin users, and is referenced by the default **ADMINISTRATORS** admin group, which associates it with the built-in *Admin Signin* authentication policy.

To read more about default admin groups, see ["Creating Admin Groups" on page 540](#). To read more about built-in authentication policies, see ["Viewing Admin Authentication Policies" on page 531](#).

This preset configuration of rules, groups, and policies is suitable for typical use cases involving whole-organization authorization needs. In other words, where you require only a single admin user authorization path that matches all users. For scenarios where you require more specific admin user authorization checks, you can create additional rules to match specific types of users.

When you create a rule, you select the admin attribute with which you want this rule to test. nSA provides the following rule attribute types:

- **username:** For local authentication methods, choose this attribute type to match against locally-defined user names.
- **SAML (Azure AD):** For SAML authentication methods, choose this attribute type to match against user names or groups provided by the SAML service.
- **Custom:** For SAML authentication methods, choose this attribute type to match against a custom SAML attribute expression.

To create a admin rule:

1. From the nSA menu, click the **Administration** icon, then select **Admin Management > Admin Rules**.

The *Admin Rules* page appears. This page lists all admin rules.

- Click **Add**.

The **Add Admin Rule** form appears.

ADMIN RULES				ADD	EDIT	DELETE	
20 ADMIN RULES							
<input type="checkbox"/>		NAME ↑	ATTRIBUTE TYPE	EXPRESSION			
<input type="checkbox"/>		AppdiscoveryOne User	username	MATCHING " appdiscone@psecure.net "			
<input type="checkbox"/>		AppdiscoveryTwo User	username	MATCHING " appdisctwo@psecure.net "			
<input type="checkbox"/>		Custom_new	saml (Azu...	samlMultiValAttr.{http://schemas.microsoft.com...			
<input type="checkbox"/>		custom_test	saml (Azu...	samlMultiValAttr.{http://schemas.microsoft.com...			
<input type="checkbox"/>		custom3	saml (Azu...	samlMultiValAttr.{http://schemas.microsoft.com...			
<input type="checkbox"/>		customAttr_Rule	saml (Azu...	samlMultiValAttr.{http://schemas.microsoft.com...			
<input type="checkbox"/>		group_rule_dummy	saml (Azu...	userAttr.{http://schemas.microsoft.com/ws/2008...			
<input type="checkbox"/>		Matching Saml User	username	MATCHING " autouser1@ztaperfqa.net "			
<input type="checkbox"/>		Non-Matching User	username	NOT MATCHING " test@psecure.net "			
<input type="checkbox"/>		NWSAML_USER	username	MATCHING " autouser* "			
<input type="checkbox"/>		rbac	username	MATCHING " rbac* "			
<input type="checkbox"/>		ROASAML_USER	username	MATCHING " autouser* "			

- Enter a **Rule Name**.

4. Click **Select Attribute Type** and select one of the available options:

- *Username*: Matches user names in a local authentication method. When you select this option, you must then:
 - Select an **Expression** type, either *Matching* or *Not Matching*.
 - For the **Admin** value, enter a match expression for the selected **Expression** type.
For the value:
 - A comma-separated list of items is supported where required.
 - Wildcard matches are supported.
 - Special characters are supported.
 - Single and double quotes are not supported.

Ivanti recommends that a basic asterisk wildcard is not used when you intend to associate admin roles with user groups. Instead, a more-specific wildcard that only includes admin users is required in this case to prevent all users having total access rights.

- *SAML (Azure AD)*: Matches user names or groups in a SAML authentication method. When you select this option, you must then:
 - Select a **SAML Attribute Type**, either *Username* or *Group*.
 - For **Attribute Value**, enter a match expression for the selected **SAML Attribute Type** as a SAML expression.

- *Custom*. Matches against a custom SAML attribute expression. When you select this option, use the **Type or Create an Expression** property to enter an attribute expression. Supported formats include:

- For simple user attribute key-value matching, use the syntax `userAttr.<attr-key> [=|!=] <attr-value>`. For example:

```
- userAttr.memberOf = "CN=sales,DC=example,DC=com"
- userAttr.mail = "user1@example.com"
- userAttr.realm = "Users"
- userAttr.department != "example_department"
```

- To match against attributes that can have multiple values associated with a single attribute key, use the syntax `samlMultiValAttr.<attr-key> [=|!=] (<list>)`. For example:

```
- samlMultiValAttr.memberOf =
("CN=Employee,CN=Users,DC=example_demo,DC=com")
- samlMultiValAttr.memberOf = ("CN=Users,DC=example_
demo,DC=com")
```

- Use brackets and AND/OR operators to construct logical compound expressions:

```
- userAttr.groups = ("Group1" or "Group2")
- userAttr.realm = ("ztaqa") and samlMultiValAttr.memberOf =
("CN=sales,DC=uisdp,DC=com")
- userAttr.realm = ("ztaqa") or samlMultiValAttr.memberOf =
("CN=sales,DC=uisdp,DC=com")
- userAttr.realm != ("ztaqa") and samlMultiValAttr.memberOf
= ("CN=sales,DC=uisdp,DC=com")
```

5. Click **Create**.

The new admin rule is added to the list of admin rules.

6. Repeat steps 3-6 for each required user rule.
7. (Optional) Edit an existing admin rule by selecting its check box and then clicking **Actions > Edit**. Make any required updates and save the changes.
8. (Optional) Delete an unused admin rule by selecting its check box and then clicking **Actions > Delete**. You must confirm the deletion.

After you have created all required admin rules, you can create admin groups, see ["Creating Admin Groups" below](#).

Creating Admin Groups

After you have created admin rules (see ["Creating Admin Rules" on page 535](#), you associate one or more admin rules with an authentication policy to form a Admin group.

Admin groups are one of the four dimensions of a Secure Access Policy.

nSA includes the following default user group:

- *ADMINISTRATORS*. This admin group associates the default *ALLADMINUSERS* admin rule with the built-in *Admin Signin* authentication policy.

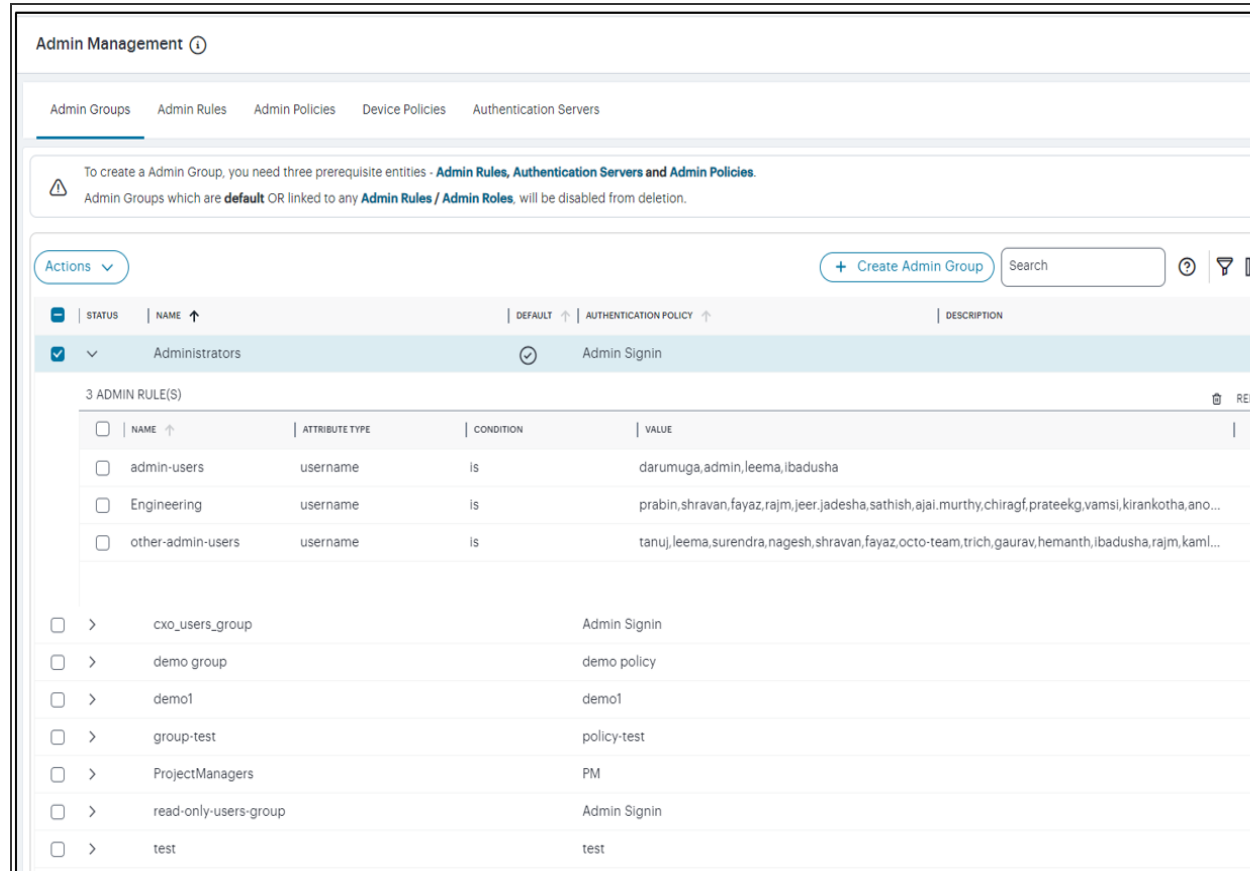

To read more about built-in authentication policies, see ["Viewing Admin Authentication Policies" on page 531](#).

This preset configuration of rules, groups, and policies is suitable for typical use cases involving whole-organization authorization needs. In other words, where you require only a single admin user authorization path that matches all users. For scenarios where you require more specific admin user authorization checks, you can create additional admin groups to make different associations of admin rules and custom authentication policies.

To create a admin group:

1. From the nSA menu, click the **Administration** icon, then select **Admin Management > Admin Groups**.

The *Admin Groups* page appears. This page lists all admin rule groups.

2. Click **Create Admin Group**.

A form appears to enable you to create the admin group.

3. Enter a **Admin Group Name**.
4. Click **Select an Authentication Policy** and select the required authentication policy.
5. Add a **Description** for the admin group. Click **Next**.
6. Select each of the listed **Admin Rules** that are required in the user group. Click **Next**.
7. Select each of the listed **Admin Policies** that are required in the user group. Click **Next**.

8. Verify the Summary page and click **Create**.

The new admin group appears in the **admin Groups** list.

9. Repeat steps 2-7 to create all required user groups.
10. (Optional) To edit a listed admin group, select the corresponding check box and click **Actions > Edit**, and make any required updates.
11. (Optional) To delete an *unused* admin group, select the corresponding check box and click **Actions > Delete**, and then confirm the deletion.
12. (Optional) Use the Advanced Filter to list based on Name or Authentication Policy.

After you have created admin groups, you can optionally assign the admin group to an admin role, see ["Associating Admin Groups with Admin Roles" below](#)

Associating Admin Groups with Admin Roles

An admin role defines the elements of the admin interface that an associated admin user group can access.

The current admin can only access an individual admin interface page/workflow if their admin group is associated with an admin role that permits it. The tasks they can perform within that displayed element depends on the permissions set within the admin role.

When you are using admin roles, Ivanti recommends that any admin rules for administrators does not use a basic asterisk wildcard, see ["Creating Admin Rules" on page 535](#). Instead, a more-specific wildcard that only includes admin users is required in this case to prevent all users having total access rights.

The default admin roles are not created by the tenant admin using the nSA user interface. Rather, they are set up by the Ivanti DevOps team.

For example, the DevOps team might define the following admin roles:

- The *.Administrators* admin role has access to all user interface elements (full read, create, update, delete rights).
- The *.Read-Only Administrators* admin role has access to all user interface elements except workflows (read only).

- The *.Network Administrators* admin role has access to Gateways and Insights (read only).
- The *.CxOs* admin role has access to Insights only (read only).

 For more information about your assigned admin roles, please contact Ivanti DevOps.

The Admin can view admin roles in the **Administration > Admin Roles** page, and associate each role with a single user group.

To associate a user group with an admin role:

1. Log into the nSA as a Tenant Admin.
2. From the nSA menu, click the **Administration** icon, then select **Admin Roles**.

A list of Admin Roles appears. This includes default admin roles and custom admin roles (RBAC).
For example:

Admin Roles ⓘ				Create Role
Actions ▾				Search
<input type="checkbox"/>	ROLE NAME ↑	DEFAULT ↑	USER GROUP NAME ↑	DESCRIPTION ↑
<input checked="" type="checkbox"/>	.Administrators	✓	Administrators	All pages accessible
<input checked="" type="checkbox"/>	.CxOs	✓	cxo_users_group	Insights Dashboards, Logs , Reports & Subscriptions
<input checked="" type="checkbox"/>	.Network Administrators	✓		Gateways Overview and Logs only
<input checked="" type="checkbox"/>	.Read-Only Administrators	✓	read-only-users-group	All except Workflows , Subscriptions , Upgrade & Admin Role
<input type="checkbox"/>	demo		avadmingrp	
<input type="checkbox"/>	ProjectManagers		ProjectManagers	
<input type="checkbox"/>	role-test		group-test	

- Click **Actions > Edit** for the admin role you want to update.

A dialog appears. For example:

- Under **Choose group**, select the user group that you want the admin group to be associated with.
- Click **Save Changes**.
- (Optional) Repeat steps 3 to 5 for each admin role.

Role-based Access Control for Admin Users

With Role-based access control (RBAC), organizations can easily add admins and assign them specific roles, with differing levels of access to the nSA Admin Portal. In addition to an existing set of default roles, Administrators can now create custom granular roles for specific functions within the nSA admin portal.

The following examples illustrate how an organization can leverage role-based administration for a variety of scenarios.

To create a custom admin role:

1. Log into the *Controller* as a Tenant Admin, see ["Logging in to the Ivanti Neurons for Secure Access as a Tenant Admin"](#) on page 24.
2. From the *ICS* menu, select **Administration**, then select **Admin Roles**.
3. In the Admin Roles page, click **Create Role**. The Create Admin Role page appears.

4. Enter a unique name for the role.
5. From the drop-down list, select the User Group that you want to associate with this role. For details, see ["Associating Admin Groups with Admin Roles"](#) on page 542.
6. Optionally, enter a **Description**.
7. From the drop-down list, select an existing role that suits your requirements.

8. Under Permission Settings, the *Controller Permissions* list shows the list of resources. The resources specific to nZTA are tagged with **ZTA** and resources specific to ICS are tagged with **ICS**.

11. Click **Select Gateways**. In the Select Gateways dialog, select one or more Gateways / Clusters from the list and click **Apply**.

12. Select the Hide, View only, or Modify permissions for each resource and its attributes. This determines which pages to show and which actions to allow.
13. Click **Create**. The newly created custom admin role is displayed in the Admin Roles page.
14. (Optional) Edit an existing admin role by clicking **Actions > Edit**. Make any required updates and save the changes.
15. (Optional) Delete an unused custom admin rule by clicking **Actions > Delete**. You must confirm the deletion.

New pages added as part of Controller/Gateway updates are visible to Super Admins by default, but hidden for custom admin roles. Super Admins can modify the permissions for the new pages added based on the custom roles created.

Workflow: Creating a Local Authentication Policy

This process involves creating a local authentication *method* and defining within it all user credentials necessary to identify and authenticate your end-users. Before you begin, make sure you have all user details (name and password) ready.

nSA includes built-in default authentication policies, each of which references a built-in local authentication method.

To configure a *new* local authentication method:

1. Log into the nSA as a Tenant Admin
2. From the nSA menu, click the **Administration** icon, then select **Admin Management > Authentication Servers**.

The **Authentication Servers** page appears. This page lists all existing admin authentication methods. For example:

Admin Management ⓘ

Admin Groups Admin Rules Admin Policies Device Policies **Authentication Servers**

⚠ Authentication Servers which **default** OR linked to any **Admin Policy**, will be disabled from deletion.
Local Authentication Servers which have one or more admins linked to them will be disabled from deletion.

Create Authentication Serv

At any point during this process, you can reset the form data by clicking **Reset**. You can also view existing authentication methods in a pop-up dialog by clicking **View Auth Methods**.

4. Under **Choose name and type**:

- Enter an **Authentication Server Name**.
- Select the **Authorization Type** of *Local*.

5. Configure the password options. This is applicable to default Admin Auth and default User Auth.

Settings	Guidelines
Minimum length	Specify a number of characters. The valid range is 6-128. 6 is the default.
Maximum length	Specify a number of characters. The valid range is 6-128. 128 is the default. The maximum length cannot be less than the minimum length.
Minimum digits	Specify the number of digits required in a password. Do not require more digits than the value of the maximum length option.
Minimum letters	Specify the number of letters required in a password. Do not require more letters than the value of the maximum length option. If you enable the previous option, the combined total of the two options cannot exceed that of the value specified in the maximum length option.
Uppercase and lowercase required	Select this option if you want all passwords to contain a mixture of uppercase and lowercase letters. Require passwords to contain at least two letters if you also require a mix of uppercase and lowercase letters.
Special Characters	Select this option if you want password should contain any special characters
Different from current password	Select this option if the password must not be same as the current password.
Different from username	Select this option if the password must not be same as the username.
Different from previous password	Select this option and then select a number from the drop-down if a new password must not be same as the previous number of passwords.
Force password change	Select this option to specify the number of days after which a password expires. The default is 180 days.

Settings	Guidelines
Allow users to change passwords	Select this option if you want users to be able to change their passwords. In addition to selecting local authentication password management options, you must select the Enable Password Management option for the associated realm authentication policy.
Prompt users to change password	Select this option to specify when to prompt the user to change passwords.

6. Click **Create User** and enter the following settings:

- Enter **User Name**, **Full Name**, and **Email** for the user.
- Enter **Password** and **Confirm Password** for the user.
- (Optional) Select the **Temporary Password** check box if you want the user to change their password when they first log in.
- Click **Add To Users List**.

The user is added to the list of users.

7. Repeat the previous step for each required user.

8. Click **Create Authentication Server**.

The new local user authentication method is added to the list of methods and the process is complete.

9. (Optional) To edit a listed authentication method, select its check box and select **Actions** drop-down and then click **Edit**. Make any required updates and confirm.
10. (Optional) To delete one (or more) *unused* authentication methods, select the check box for each, select **Actions** drop-down and click **Delete**. You must confirm the deletion.

After you have created your local authentication method, create or update your authentication policy with the new authentication method. In most cases, you need a minimum of one policy:

- admin sign-in

nSA allows for the definition of custom policies to facilitate separate authentication endpoints for specific groups of users. To learn more, see ["Viewing Admin Authentication Policies" on page 531](#).

Repeat the following steps for each policy, starting with enrollment:

1. From the nSA menu, click the **Administration** icon, then select **Admin Management > Admin Policies**.

The **Admin Policies** page appears. This page lists all existing user authentication policies.

A server which is selected as primary(if applicable) would not be available for selection as secondary.

SECONDARY AUTH SERVER
Select from Local and TOTP Auth Servers ▼

Cancel Create Admin Policy

- Enter a **Policy Name**.
- Enter a **Login URL** using the format `*/login/<path>/`.

The URL must start with `*/login/` and cannot contain any special characters. `<path>` should be set to a unique value reflecting the endpoint URL you want to define for this authentication policy (appended with a backslash):

- In the case of admin sign-in policies, this is the URL endpoint (appended to the tenant FQDN) to which new users are invited to connect to enroll or sign-in a device with the nSA. Example value: `*/login/admin/`.

- (Optional) Enter a description for the authentication policy.

6. Select a **User Type** based on the intended authentication activity for this policy. Choose from:
 - **Administrators**: Select this option to define the authentication endpoint for administrator-level sign-in. This endpoint is used for administrator login to the nSA only.
7. Under **Auth Servers**, click **Primary Auth Server**, and select the required authentication method for the policy from the drop-down list.
8. Click **Secondary Auth Server**, and select the required authentication method for the policy from the drop-down list.
9. Click **Create Admin Policy** to create the new policy.

The new policy is added to the list of authentication policies.

The new policy is added to the list of authentication policies.

If you instead elect to update an existing custom or built-in policy:

1. Select the check box adjacent to the relevant policy, select **Actions** drop-down and click **Edit**.

The **Edit Admin Policies** form appears.

For built-in authentication policies, all properties except **Primary Auth Server** are read-only.

- Set the **Primary Auth Server** to be the new local user authentication method (indicated):

Update Admin Policy

- Click **Update Admin Policy**.

The list of authentication policies updates.

- Repeat until all required authentication policies are updated.

To ensure that your admin can access the authentication mechanism defined in the policies you configure through this process, make sure your *Secure Access Policies* are configured with a **Admin Group** in which these authentication policies are defined.

Workflow: Creating a SAML Authentication Policy With Azure AD and SAML(Custom)

i You can use the same work flow for creating SAML (Custom) as well.

nSA supports the use of a cloud-based Active Directory (AD) SAML service to provide authentication for your users.

If you choose to use AD as a SAML Identity Provider (IdP), you do not create any users locally on the nSA. All users will already be present in your remote SAML service.

Configuring nSA to use SAML authentication requires you to create separate SAML apps on the Azure AD platform for the following primary activities:

- Admin sign-in

The nSA includes built-in default authentication policies for each of these purposes, and also includes the ability to create your own custom policies for separate authentication of specific admin groups. You create an authentication method referencing one of the Azure AD SAML apps described above and then assign the method to an authentication policy of the same type (either the built-in policy, or one you create). Begin with enrollment, and then repeat the process for user sign-in.

1. Log into the nSA as a Tenant Admin.
2. From the nSA menu, click the **Administration** icon, then select **Admin Management > Admin Authentication**.

The *Admin Authentication* page appears. This page lists all existing user authentication methods:

Admin Management ⓘ

Admin Groups Admin Rules Admin Policies Device Policies **Authentication Servers**

⚠ Authentication Servers which **default** OR linked to any **Admin Policy**, will be disabled from deletion.
Local Authentication Servers which have one or more admins linked to them will be disabled from deletion.

Create Authentication Server

At any point during this process, you can reset the form data by clicking **Reset**. You can also view existing authentication methods in a pop-up dialog by clicking **View Auth Methods**.

4. Under **Choose name and type:**

- Enter an **Authentication Server Name**. For example: *Enrollment* or *SignIn*.
- Select the **Authorization Type** of *SAML (Azure AD)*.

The form expands to show additional settings:

The screenshot shows a web form titled "Add Authentication Method". In the top right corner, there are two links: "View Auth Methods" and "Reset". The form is divided into sections. The first section, "Choose name and type", contains two input fields: "AUTHENTICATION SERVER NAME" with the value "test" and "AUTHENTICATION TYPE" with a dropdown menu showing "SAML (Azure AD)". The second section, "Fields required for SAML Authentication Server", includes a checkbox for "Allow Unsigned Metadata" which is unchecked, a text input for "Single Logout URL", and radio buttons for "Upload" (selected) and "Enter Manually". Below these are two more inputs: "LOCATION" with a dropdown showing "File" and "FILE" with a text input "Upload a file here". At the bottom right, there are two buttons: "Cancel" and "Add Admin Authentication".

5. (Optional) Enter a **Single Logout URL**. For more information.

6. To provide your SAML IdP settings, select one of the following:

- Select **Upload** to upload a digitally-signed (or unsigned) federation metadata XML definition file downloaded for this SAML activity from Azure AD. That is, for either user enrollment or user sign-in.

By default, the ICS expects a signed metadata definition file. To allow an unsigned metadata file, select **Allow Unsigned Metadata**.

Then, upload your metadata file by clicking **Upload a file here**.

- Select **Enter Manually** to manually enter the required IdP SAML settings. Use this option in scenarios where a SAML federation metadata file is not available or incomplete.

Then, enter the following details:

Fields required for SAML Authentication Server
☐ Upload ☒ Enter Manually

IDP Entity Id

IDP SSO URL

IDP SLO Service

USER NAME TEMPLATE
<assertionNameDN.uid>

IDP Signing Certificate

The following minimum settings are required for your SAML authentication service to function correctly. Each setting relates to a value configured in the SAML application on your IdP. Contact your IdP administrator to obtain the relevant details:

- **IDP Entity ID:** The entity ID is sent as the Issuer value in the SAML assertion generated by the IdP. Enter the Issuer value in assertions generated by the SAML identity provider.
- **IDP SSO URL:** A URL provisioned by the SAML IdP to support service-provider-initiated Single Sign-On. Use the format `https://<FQDN>`.
- **IDP SLO Service:** (Optional) A URL to specify the Single Log-Out/sign out endpoint if you want to force re-authentication for increased security. Use the format `https://<FQDN>`. For more information.

- **User Name Template:** Specify how the system is to derive the username from the SAML assertion. The default value can be used, or replaced with an alternative specifier. For example: `<assertionNameDN.uid>`, the `NameID` value where ICS is the IdP, the UID from `X509SubjectName`, `<userAttr.attr>`, `attr` from `AttributeStatement` attributes.
- **IDP Signing Certificate:** The signing certificate to be used with the SAML app on the IdP. Type or paste in the contents of your Base-64 encoded public key.

If, at a later date, you need to modify the metadata definition file, edit the authentication method through the *User Authentication* page and repeat this step. However, note that federation metadata files from Azure AD are digitally-signed and so cannot be manually edited prior to upload back into nSA. This process supports replacing a definition file *only* with another digitally-signed and validated definition file.

7. Confirm that your settings are correct, then select **Add Admin Authentication** to create the authentication method.

The new SAML user authentication method is added to the list of methods displayed in the **Admin Authentication** page, and the process completes.

After you have created your SAML authentication method, create or update your authentication policies with the new authentication method:

1. From the nSA menu, click the **Administration** icon, then select **Admin Management > Admin Policies**.

The **Admin Policies** page appears. This page lists all existing user authentication policies.

Create Admin Policy

At any point during this process, you can reset the form data by clicking **Reset**. You can also view existing authentication policies in a pop-up dialog by clicking **View Auth Policies**.

3. Enter a **Policy Name**.

4. Enter a **Login URL** using the format `*/login/<path>/`.

The URL must start with `*/login/` and cannot contain any special characters. `<path>` should be set to a unique value reflecting the endpoint URL you want to define for this authentication policy (appended with a backslash):

- In the case of admin sign-in policies, this is the URL endpoint (appended to the tenant FQDN) to which new users are invited to connect to enroll or sign-in a device with the nSA. Example value: `*/login/adminlogin/`.

In some enrollment circumstances, such as when using a device pre-installed with an older version of Ivanti Secure Access Client, you connect directly to the enrollment policy endpoint to enroll the device. For more details, see ["Viewing Admin Authentication Policies" on page 531](#).

5. (Optional) Enter a description for the authentication policy.
6. Select a **User Type** based on the intended authentication activity for this policy. Choose from:
 - **Administrators:** Select this option to define the authentication endpoint for administrator-level sign-in. This endpoint is used for administrator login to the nSA only.
7. Under **Policy Server Details**, click **Primary Auth Server**, and select the required authentication method for the policy from the drop-down list:

Alternatively, select *Add New Server* and create a new authentication method as per the steps described earlier in this section.

8. Click **Create Admin Policy** to create the new policy.

The new policy is added to the list of authentication policies.

If you instead select to update an existing custom or built-in policy:

1. Select the check box adjacent to the relevant policy and click **Actions > Edit**.

The **Edit authentication policy** form appears.

For built-in authentication policies, all properties except **Primary Auth Server** are read-only.

- Set the **Primary Auth Server** to be the new SAML user authentication method (indicated):

Cancel Update Admin P

- Click **Update Admin Policy**.

The list of authentication policies updates.

- Repeat until all required authentication policies are updated.

At this point, the nSA uses the uploaded Federation Metadata to contact the SAML service. After this process completes, a **Download** function becomes available for each relevant policy. This metadata file is required to configure trusted communication with the remote SAML service.

- Refresh your browser until the **Download** action is visible for the relevant policies.
- Select the check box for the policy metadata you want to download and clear all other check boxes.

3. Click **Download** and save the metadata file.

As mentioned previously, make sure you repeat this procedure for each required SAML app on your Azure AD platform. That is, you require separate XML metadata files for the enrollment authentication policy and the login authentication policy.

After the **Admin Authentication** workflow is complete, you can configure the Azure AD platform with the XML configuration of the nSA.

Finally, to ensure that your users can access the authentication mechanism defined in the policies you configure through this process, make sure your *Secure Access Policies* are configured with a **Admin Group** in which these authentication policies are defined.

Checking Tenant Admin Logs

The Tenant Admin Logs page displays logs of all admin activities from login to logout such as Register, Delete, Upgrade, Reboot, and Rollback.

It also displays all config authoring use cases except the certificate management. The logs include details of create, update, delete and re-order operations.

The log retention period is 90 days.

To view the Tenant Admin Logs page:

1. Log in to the Ivanti Neurons for Secure Access Admin portal as a Tenant Admin, and select **Ivanti Connect Secure** from the Gateway Switcher. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. From the Ivanti Connect Secure menu, select **Administration > Tenant Admin Logs**.

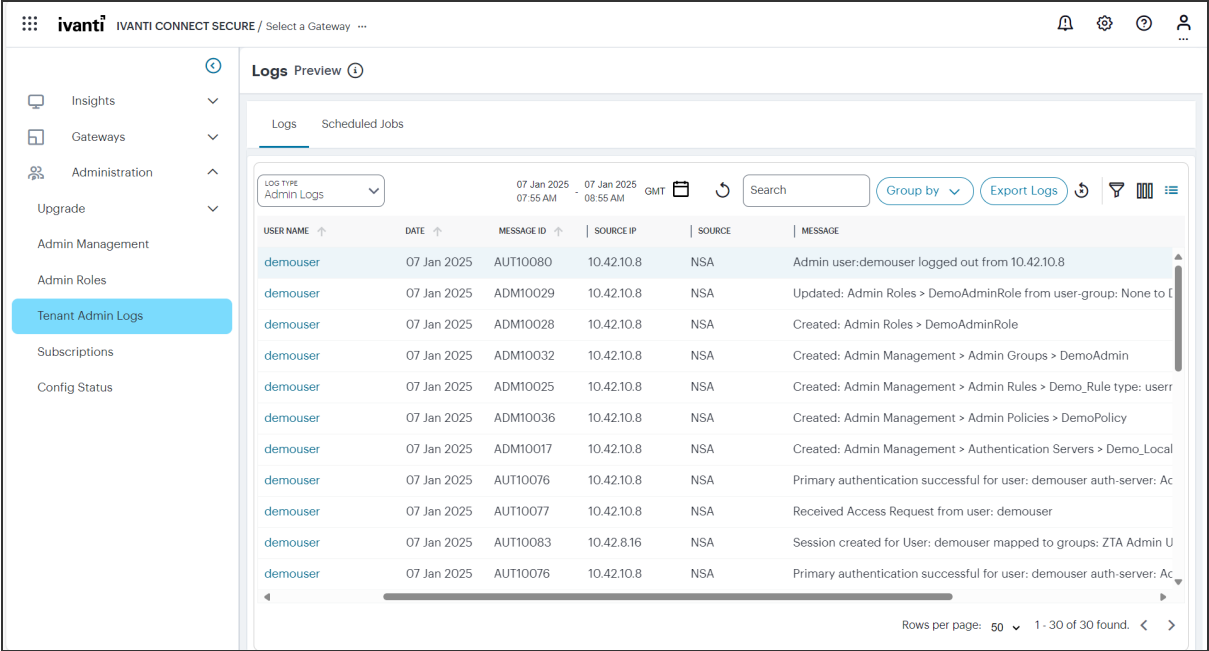

The Logs page is displayed showing a list of Admin logs for all the admin activities.

The table shows the log generated date and time, "Severity", "Message ID" and "Message", and "Source IP" and "Source" Gateway name.

The "Source" field will be empty if the corresponding log is not tied to any specific gateway.

The example screen shows a few admin activities between login and logout.

Message ID	Action
ADM10005	Restart services
ADM10006	Create configuration
ADM10007	Edit configuration
ADM10008	Delete configuration

For additional list of Message IDs, see "Appendix " on page 583.

- Use the time period selectors at the top of the page to set a time period or time range for your log results. For details, see "Setting a Log Time Period" on page 119.
- Logs are refreshed automatically by changing the criteria. To manually refresh the log display, click the following icon:

- To group the logs based on the fields, use the **Group by** button and select the field type to view the table information in groups.

- To export the displayed log as a CSV or JSON text file, or to set up a new scheduled log export job, click the **Export Logs** button. To learn more about log export jobs, see ["Exporting Logs" on page 125](#).
- To trigger the advanced filter selection, use the following icon. For details, see ["Filtering the Logs" on page 123](#).

- To reset the filter, click the following icon:

- To change the fields displayed for each log line, click the following icon:

- To change the view density, click the following icon:

Synchronizing the Configuration

When admin modifies or updates a device policy or a secure access policy and applies the changes, the synchronization might fail due to any wrong values in the configuration. The Alerts page shows the error log.

Based on the error log information, analyze and fix the configuration. Then use the Sync Now option to initiate the configuration synchronization.

To view the **Alerts** page, click the **Alerts** icon and then click **See all Alerts**:

Alerts ⓘ

⚠

Configuration out of sync

The configuration is out of sync and is not applied. Your system may not work as expected.

Please follow these steps:

1. Check which configuration has failed in the table below. Refer to the description column.

2. Fix the configuration in the respective page.

3. Goto **Administration > Config Status** page and click on **Sync Now** button.

100 ALERTS

Using the Troubleshooting Tools

- ["Introduction" below](#)
- ["Using the Debug Log" on page 575](#)
- ["Using Network Troubleshooting Commands" on page 576](#)
- ["Using System Snapshots" on page 578](#)
- ["Using the TCP Dump Utility" on page 578](#)

Introduction

The Troubleshooting page enables you to investigate issues that might be affecting your Gateway or preventing it from operating normally.

This page is intended to enable Ivanti Technical Support teams to help resolve problems with your Gateway infrastructure. Due to the potential for system performance to be impacted through the use of these features, Ivanti recommends you only use this page when advised to do so.

The following tools are available through the Gateways > Troubleshooting page:

- **Debug logs** - Work with Ivanti Technical Support teams to diagnose system issues.
- **Network troubleshooting commands** - Use standard network commands, such as ping, traceroute, NSlookup, and other commands to diagnose networking issues.
- **System snapshots** - Work with Ivanti Technical Support teams to reproduce and diagnose system issues.
- **tcpdump** - Sniff packet headers to diagnose networking issues.

To access Troubleshooting page:

1. Log in to the Ivanti Neurons for Secure Access portal as a Tenant Admin. See ["Logging in to Ivanti Neurons for Secure Access" on page 24](#).
2. Use the Gateway Switcher and select **Ivanti Connect Secure**.

3. From the Ivanti Connect Secure menu, click the **Gateways** icon, then select **Gateways > Gateways List**.

The All Gateways page is displayed showing a list of standalone ICS Gateways and cluster nodes.

Using the Debug Log

The Ivanti Technical Support teams might direct you to create a debug log to assist them in helping you debug an issue with the system.

To use debug logging:

1. From the **Troubleshooting Logs and System Snapshots** drop-down menu, select **Debug Log**.

The screenshot shows the 'GATEWAYS gwpcsn121' interface. Under the 'Troubleshooting Logs and System Snapshots' section, the 'SELECT TROUBLESHOOTING TASK' dropdown is set to 'Debug Log'. A text box explains that various sections allow Admin to upload sessions to the controller for download. Below this, a paragraph states that trace recording can be made for website issues and sent to Ivanti Support. The configuration area includes input fields for 'Process Names' and 'Event Codes', both with information icons. There are also input fields for 'MAX DEBUG LOG SIZE (MB)' (set to 2) and 'LOG DETAIL LEVEL' (set to 0), both with information icons. An unchecked checkbox labeled 'Include System Logs' is present. A checked checkbox labeled 'Enable Debug Logs' is also shown. At the bottom are three buttons: 'Upload' (blue), 'Save Settings' (blue), and 'Cancel' (white).

2. Specify the **Process Name**.
3. Specify the **Event Code**.
4. Specify a **Maximum debug log file size**. The default is 2 MB. The maximum debug log file size is 250 MB. For Gateways with disk space > 80 GB, the maximum debug log file size is 1024 MB.
5. Specify the debug **Log detail level**.
6. Select *Include System Logs** option to include system logs in the debug log file. Recommended.
7. Select **Enable Debug Logs**.
8. Click **Save Settings**. The system begins generating debug log entries.
9. Click **Upload**.

A confirmation message is displayed. You can then download the file from the Troubleshooting Overview page and analyze the logs.

Using Network Troubleshooting Commands

You can run common network troubleshooting commands such as arp, ping, ping6, traceroute, traceroute6, NSlookup, and AvgRTTs from the admin console. You can use these connectivity tools to see the network path from the system to a specified server. If a client can ping or traceroute to the access system, and the access system can ping the target server, any remote users should be able to access the server through the access system.

To run network troubleshooting commands:

1. From the **Troubleshooting Logs and System Snapshots** drop-down menu, select **Commands**.

The screenshot shows the 'GATEWAYS' section for 'gwpcsn121', which is 'Gateway Ready'. The 'Troubleshooting Logs and System Snapshots' dropdown menu is open, and 'Commands' is selected. A help icon and text explain that various sections allow Admin to upload sessions and download files. Below this, a text block explains that common network troubleshooting commands like ping, ping6, traceroute, etc., can be run from the Admin console to see the network path to a specified server. The 'SELECT COMMAND' dropdown is set to 'Ping'. The 'TARGET SERVER' is '10.96.158.125'. Three radio buttons are present: 'Internal or Virtual Port' (selected), 'External or Virtual Port', and 'Management Port'. The 'Output' section displays the results of a ping command: 'PING 10.96.158.125 (10.96.158.125) from 10.96.158.121 int0: 56(84) bytes of data.' followed by ten lines of '64 bytes from 10.96.158.125: icmp_seq=1-10 ttl=64 time=0.124-0.163 ms'.

2. Select a network troubleshooting command from the options:

- Ping/Ping6
- Traceroute/Traceroute6
- NSlookup
- ARP
- AvgRTTs
- Portprobe
- Cluster Roundtrip

3. When prompted:

- Specify the IP address or hostname for the target server.
- Select the interface from which to send the command.

4. Click **Start** to run the command and write the output to the screen.

Using System Snapshots

A snapshot of the system state captures details that can help Ivanti Technical Support teams diagnose system performance problems. The system stores up to ten snapshots, which are packaged into an encrypted "dump" file that you can download and then e-mail to Ivanti Technical Support teams.

To create and manage system snapshots:

1. From the **Troubleshooting Logs and System Snapshots** drop-down menu, select **System Snapshots**.

The screenshot shows a web interface for a gateway named 'gwpcsn121'. The status is 'Gateway Ready'. The main section is titled 'Troubleshooting Logs and System Snapshots'. It features a dropdown menu labeled 'SELECT TROUBLESHOOTING TASK' with 'System Snapshot' selected. To the right of the dropdown is an information icon and a text box explaining that various sections allow uploading sessions to the controller for download. Below this, a paragraph states that the 10 most recent snapshots are stored and can be downloaded as an encrypted package for support. Under the heading 'Snapshot Options', there are two checked checkboxes: 'Include System Config' and 'Include Debug Log'. At the bottom, there are two buttons: 'Start Snapshot(s)' in blue and 'Cancel' in white.

2. Select **Include system config** to include the system configuration file in the snapshot.
3. Select **Include debug log** to include debug logs (if any).
4. Click **Start Snapshot(s)**.

A confirmation message is displayed. You can then download the file from the Troubleshooting Overview page and analyze the logs.

Using the TCP Dump Utility

To use TCP Dump utility:

1. From the **Troubleshooting Logs and System Snapshots** drop-down menu, select **TCP Dump**.
2. Configure the following:
 - Select the ports on which to sniff (Internal, External, Management).
 - Specify a Filter expression.
 - Select a promiscuous mode option.

The screenshot shows the 'GATEWAYS' section for 'gwpcsn121', which is 'Gateway Ready'. The 'Troubleshooting Logs and System Snapshots' menu is open, and 'TCP Dump' is selected. A help note explains that various sections allow uploading sessions to the controller for download. Below this, a text block states: 'TCP Dump allows you to sniff the packet headers on the network. To check that the expected packet really reached a node, run the tcpdump utility and save the output on a dump file of your choice.' The configuration area includes three checkboxes for sniffing ports: 'Internal Or Virtual Port', 'External Or Virtual Port', and 'Management Port'. There are also input fields for 'FILTER' (containing 'Filter') and 'OPTIONS' (containing 'Options'). A 'SELECT PROMISCUOUS MODE' dropdown is set to 'Select Promiscuous Mode' with a warning icon. An 'Output:' section shows 'None'. At the bottom are four buttons: 'Upload' (blue), 'Start' (blue), 'Stop' (blue), and 'Cancel' (white).

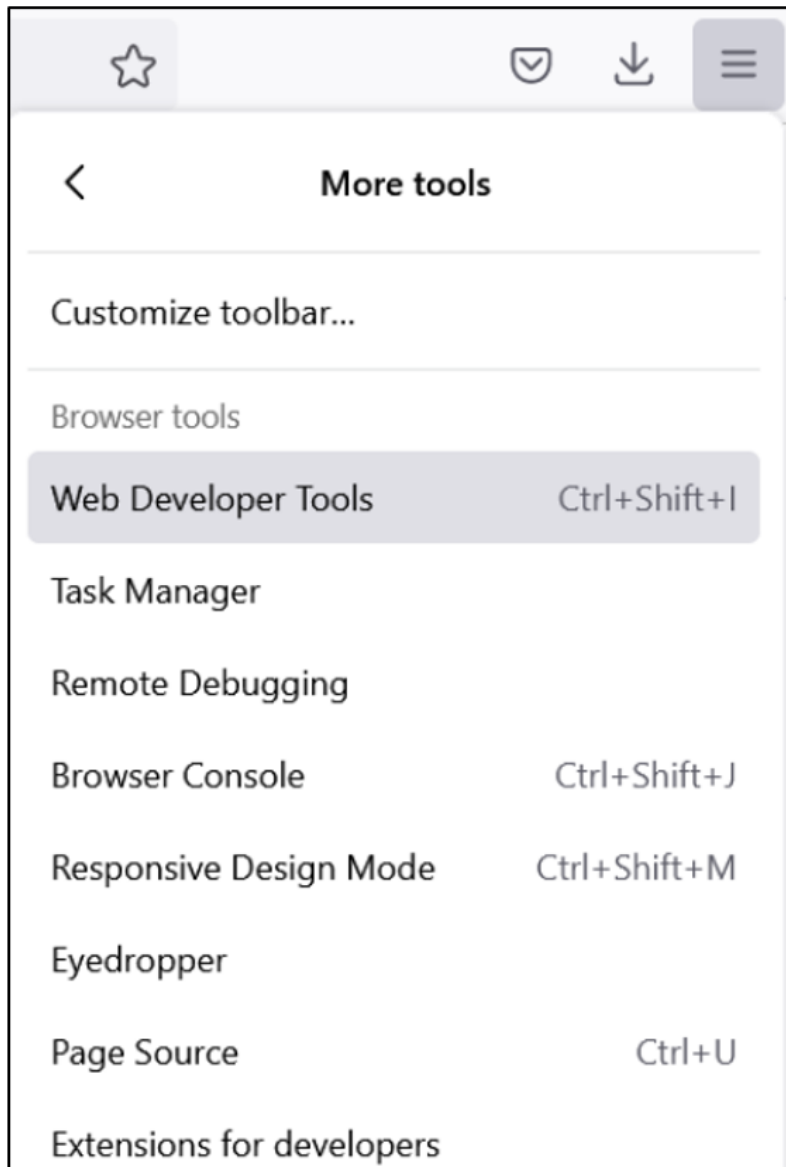

3. Click **Start** to start the TCP Dump process.
4. Click **Stop** to write the TCP Dump output to the screen.
5. Click **Upload**.

A confirmation message is displayed. You can then download the file from the Troubleshooting Overview page and analyze the logs.

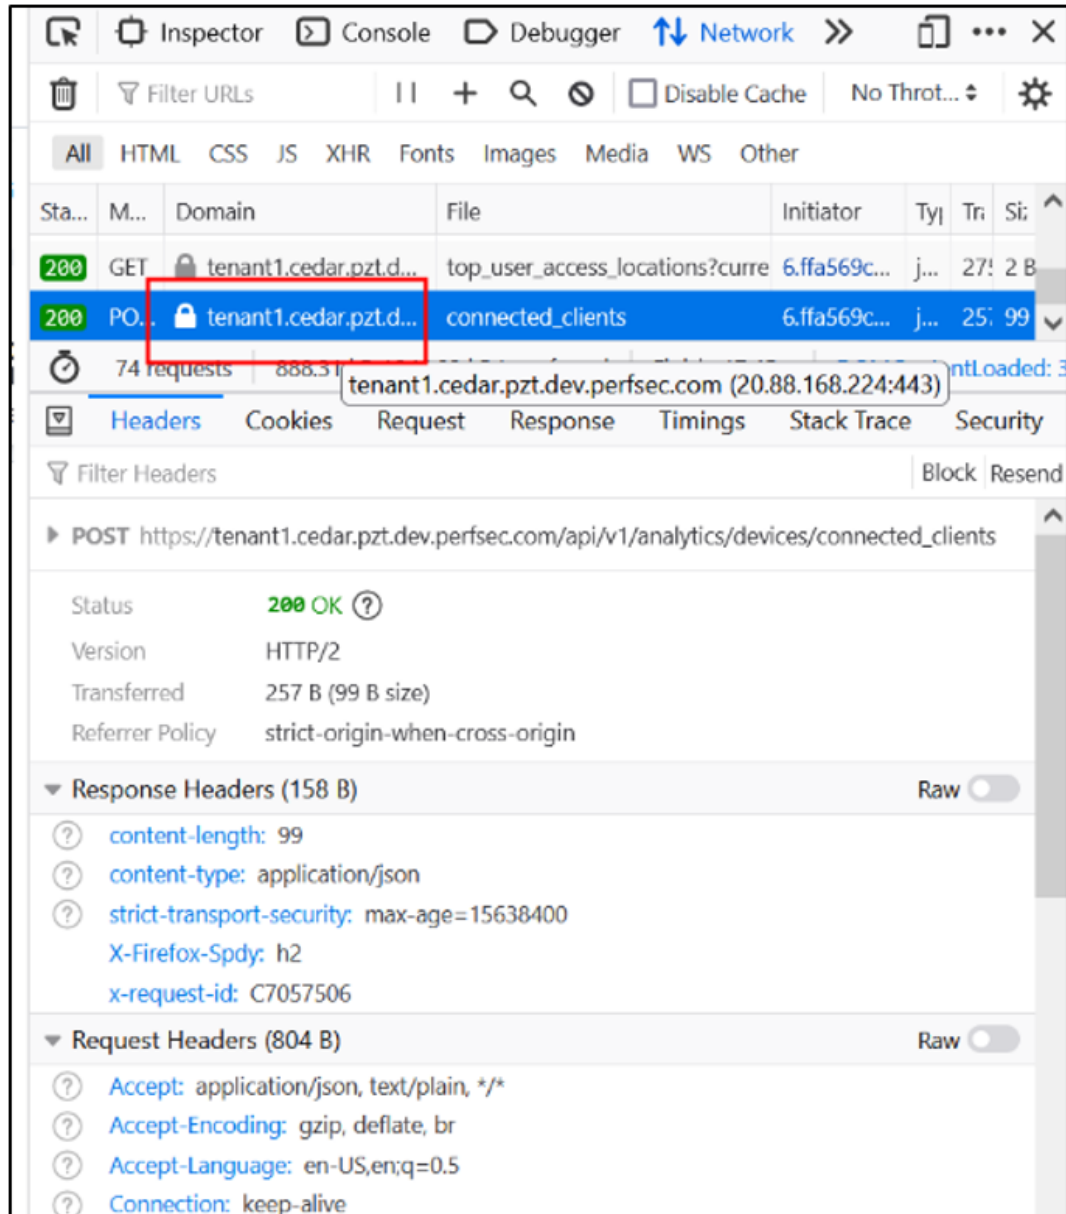

Retrieving the nSA API details using Browser

To view and download the nSA rest APIs, perform the following:

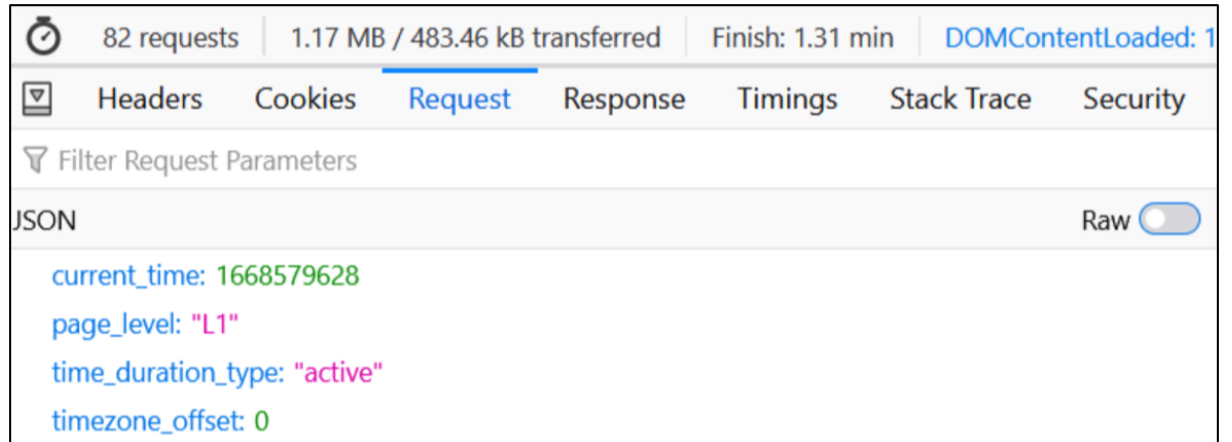

1. Log in to **nSA ICS** using any of browser for example: Chorme, Mozilla).
2. Open your **Browser** > **Click on the Right Corner 3 Vertical Dots** > **More Tools** > **Developer Tools** as shown in the below image.

3. Select **Network** tab, this list all the APIs which are in use to load a UI Page.

4. Click **Request** tab to see the payloads and **Response** tab to see the return value.

5. Click on the link, shown in [step 3](#) figure and you can see **Json**, **Raw Data**, and **Headers** tabs. You can **Save** and **Copy**.

For nSA API details, see [nSA REST API Solutions Guide](#).

Appendix

Message ID	Action
ADM10000	Created Gateway
ADM10001	Deleted Gateway
ADM10002	Initiated reboot on Gateway
ADM10003	Initiated Upgrade to version <ver no.> on Gateway
ADM10004	Initiated rollback on Gateway
ADM10005	Restarted services
ADM10006	Created configuration
ADM10007	Edited configuration
ADM10008	Deleted configuration
ADM10009	Initiated Config Import
ADM10010	Initiated Config Export
ADM10011	TOTP User Config Import
ADM10012	TOTP User Config Export
ADM10013	Created Config sync rule
ADM10014	Deleted Config sync rule
ADM10015	Modified Config sync rule
ADM10016	Triggered Config sync rule
ADM10017	Created Admin Management > Authentication Servers > Local Auth Srvr, type: Local
ADM10018	Updated Admin Management > Authentication Servers > SAML Auth Srvr, type: SAML Custom
ADM10019	Deleted Admin Management > Authentication Servers > SAML Auth Srvr
ADM10020	Created Admin Management > Authentication Servers > Local Auth Srvr > Added user: admin_1

Message ID	Action
ADM10021	Created Admin Management > Authentication Servers > Local Auth Svr > Added users: ladmin_2, ladmin_3
ADM10022	Deleted Admin Management > Authentication Servers > Local Auth Svr > Deleted user: ladmin_1
ADM10023	Deleted Admin Management > Authentication Servers > Local Auth Svr > Deleted users: ladmin_2, ladmin_3
ADM10024	Updated Admin Management > Authentication Servers > Local Auth Svr > Updated user: ladmin_1
ADM10025	Created Admin Management > Admin Rules > admin_rule1 type: Username and value: ladmin_1
ADM10026	Updated Admin Management > Admin Rules > admin_rule1 type: Username and value: ladmin_1
ADM10027	Deleted Admin Management > Admin Rules > admin_rule1
ADM10028	Created Admin Roles > admin_role1
ADM10029	Updated Admin Roles > admin_role1 from user-group: usr_grp1 to usr_grp2
ADM10030	Deleted Admin Role > admin_role1
ADM10031	Deleted Admin Roles > admin_role1, admin_role2
ADM10032	Created Admin Management > Admin Groups > adm_grp1
ADM10033	Updated Admin Management > Admin Groups > adm_grp1 from rules: adm_rule1 to adm_rule2 and admin-policy: adm_policy1
ADM10034	Deleted Admin Management > Admin Groups > admin group: adm_grp1
ADM10035	Deleted Admin Management > Admin Groups > admin rule: adm_rule2 from adm_grp1
ADM10036	Created Admin Management > Admin Policies > adm_policy1
ADM10037	Updated Admin Management > Admin Policies > adm_policy1 with primary auth-server: pri_auth_srvr1 to pri_auth_srvr2 and secondary auth-server: sec_auth_srvr1 to sec_auth_srvr2
ADM10038	Deleted Admin Management > Admin Policies > adm_policy1

Message ID	Action
ADM10039	Deleted Admin Management > Admin Policies > admin policies: adm_policy1, adm_policy2
ADM10040	Created Admin Management > Device Policies > dev_policy1
ADM10041	Updated Admin Management > Device Policies > dev_policy1 > Rules deleted: dev_rule1, dev_rule2 Rules Added: dev_rule3, dev_rule4
ADM10042	Deleted Admin Management > Device Policies > dev_policy1
ADM10043	Deleted Admin Management > Device Policies > dev_policy1
ADM10044	Created Admin Management > Device Policies > device rule: dev_rule1
ADM10045	Updated Admin Management > Device Policies > device rule: dev_rule1
ADM10046	Deleted Admin Management > Device Policies > device rule: dev_rule1
ADM10047	Deleted Admin Management > Device Policies > device rules: dev_rule1, dev_rule2
ADM10086	Initiated import of Device Certificate
ADM10087	Initiated import of Client-Auth Certificate
ADM10088	Initiated creation of Device Certificate CSR
ADM10089	Initiated creation of Client-Auth Certificate CSR
ADM10090	Initiated import of Code Signing Certificate
ADM10091	Uploaded ESAP package version
ADM10092	Deleted ESAP package version
ADM10093	Initiated ESAP Activation on multiple nodes
ADM10094	Initiated MultiNode Upgrade
ADM10095	Initiated Cluster Upgrade
ADM10096	Initiated rollback on cluster
ADM10097	Initiated Cluster Actions like VIP-Failover, enable or disable Nodes
ADM10098	Initiated Cluster operations like restart or reboot
ADM10099	Updated cluster properties like mode, VIP, etc.

Message ID	Action
ADM10100	Created ICS Gateway Cluster with nodes
ADM10101	Added Node to ICS Gateway Cluster
ADM10102	Removed Node From ICS Gateway Cluster
ADM10103	Deleted ICS Gateway Cluster
ADM10104	Deleted Named user and devices
ADM10105	Modified Named Users Auto Delete
ADM10106	Updated Settings > Session Options > idle_timeout: {} and max_session_length: {}
ADM10110	Created Config sync scheduled job
ADM10111	Deleted Config sync scheduled job
ADM10112	Edited Config sync scheduled job
AUT10076	Primary authentication successful for user: admin auth-server: Admin Auth
AUT10077	Received Access Request from user: admin
AUT10078	Started authentication with primary-auth-server
AUT10079	Primary authentication failed for user
AUT10080	Admin user logged out
AUT10081	Secondary authentication successful for user
