V5.12 (Aug 2024)

Service Mapping	New feature or enhancement
Discovery	 Added support for importing assets from Microsoft Intune and Microsoft SCCM. Added support for sending email reports for the "Schedule Scan Import" feature. Renamed the probe from 'Deep Host Scan for Windows Devices (PowerShell)' to 'Deep Host Scan - SSH SNMP Windows(PowerShell)'. Renamed the probe from 'Deep Host Scan for Windows/Linux/Network Devices (WMIC)' to 'Deep Host Scan - SSH SNMP Windows(WMIC)'. In the Vulnerability Management module, if multiple CIs are associated with the same CPE URI, all Asset IDs are now displayed, separated by commas. Added a field called "Operational Status" for Blueprint Virtual Machines when importing Azure records. Added support for scheduling imports for Azure, AWS, and Meraki. Added support for using "ip addr" as an alternative command to fetch IP addresses on Linux OS. Added support for discovering Juniper Chassis. Implemented support to set the status of the connected agent to false if the Discovery Client goes down. Added support for ping in the PowerShell scans.
CMDB	 Added support for displaying both the 'Add' and 'Cancel' buttons when selecting a Blueprint while adding a CI from the UI. Implemented support for flagging parent CIs as vulnerable in the BSM Map View when a child CI is vulnerable. Added support for enabling the Network view in BSM map views for all blueprints. Implemented support for users to delete ServiceNow Mappings
Integrations	 Added support for advanced search options for mapping Ivanti, Cherwell, and Jira link properties. Added a help link for the ServiceNow credentials popup. Added support to include Boolean properties in Service-now copy.
Admin	 Added support for users to return from the map property tab to the configuration tab in Ad Configuration.
Reports	Added support for including user properties in Ad hoc Reports

Discovery	Discovery Application (v1.0.4018) & Agent (v1.0.113):
Application & Agent	 Enhanced the App and Agent update processes to include periodic checks and the ability to download the agent from the Discovery Server.
	 Added support for Linux based agents.
	 Implemented support for users to build an agent for Windows and Linux hosts.
	 Added support for importing credentials on the Discovery application.
	 Added support for bulk deleting and flushing credentials on the Discovery application.
	 Added a feature to mask 'Configuration Name' value during data entry for Windows credentials type.
	 Added support for Windows Agent scans via PowerShell probes.
	(Note: requires Discovery App version 1.0.4018 or higher)

	T
Discovery	 Fixed the issue where sorting the column for the resource group in the "Import from Azure" module was not working correctly. Fixed the issue where the count of edited users was not updating in the Import logs after importing from AD and Azure AD. Resolved the issue where customizing columns for applied filters displayed all records instead of only the filtered ones, specifically for the AWS, Azure, and Meraki modules. Fixed the issue where the "Imported On" date was not updating when importing AWS records. Fixed the issue where 'JBoss' CI records were created even though the host did not have JBoss running. Fixed the issue where some host CIs incorrectly included information from a different host. Addressed an issue with certain scans was failing to update it status to completed.
CMDB	 Fixed the issue where the tabular order was not displaying correctly after deleting a CMDB record from the details tab. Fixed an issue where the value of a custom date field in CI records was displayed in timestamp format. Addressed an issue with the date and time format while importing the CIs. Addressed an issue where IIS Server duplicate record was being created.
Vulnerability Management	Resolved the issue in Vulnerability Management where the total number of records displayed did not align with the pagination

	 settings. Fixed the issue with filtering CVE data by selecting the published
	year from the dropdown.Resolved the application error encountered while filtering columns
	for CVEs in Vulnerability Management.
ntegrations	 Fixed the issue where property mappings in Jira mappings for
	certain Blueprints were not displaying correctly.
	 Resolved the filter issue in Incidents and Changes within CMDB for
	ServiceNow module.
	 Resolved the issue where filtering the status field on the My
	Request page was failing.
	 Resolved the issue where updating condition mappings for
	blueprints from Ivanti and Cherwell was not applying correctly.
	 Addressed an issue where "Communicates With" relationships was
	failing to be copied.
	 Resolved an issue where the CI history showed the CI was copied
	to Ivanti but the record details had it as false.
Business Rule	Fixed the issue where the action type "Create New Record" was
	not visible in the Discovery Module.
	 Added an alert for missing mandatory link properties when creating
	a business rule.
	Resolved the issue where updating hardware assets business rule
	was removing associated configuration items from the
	corresponding records.
Integrations	Fixed the issue where property mappings in Jira mappings for
intogrations	certain Blueprints were not displaying correctly.
	 Resolved the filter issue in Incidents and Changes within CMDB for
	ServiceNow module.
	Resolved the issue where filtering the status field on the My
	Request page was failing.
	 Resolved the issue where updating condition mappings for
	blueprints from Ivanti and Cherwell was not applying correctly.
Admin	Addressed an issue where updates to a user's display
Admin	name were not being reflected in the tabular view across all
	modules.
Danarta	Resolved an issue where the properties names for Hardware,
Reports	Contract, and Vendor in Reports did not match those in the main
	models.
	Fixed a bug where duplicate reports with the same name were
	created when reports were scheduled.
0	Fixed the issue where the 'Advanced Search' results did not
General	clear previously searched values when changing operators to
	'Not Empty' and 'Is Empty'.
	 Resolved the issue where certain scheduled jobs were not being
	triggered as scheduled.
	Fixed an issue in SAML where email addresses added as
	claims in the Service Provider portal were not reflected in
	Service mappings.

	Addressed issue related to personalized columns.
Discovery Application & Agent	 Discovery Application (v1.0.4018) & Agent (v1.0.113): Fixed the issue where the Agent's Last Scanned On date was not updating correctly. (Note: Requires Discovery App version 1.0.4018 or higher)

Action required by the user's post-release:

- 1. Users are advised to Clear/Delete their respective Browser Cache before using Service Mapping after the release.
- 2. Sign in to the Service Mappings web application.
- 3. Go to the Admin portal > Client (Discovery) page.
- 4. Click on the update icon [♣] to update version 1.0.4018.

Please note that if you have clicked the update button but your application is still not updating to the latest version, restrictions on your network may be preventing the updates from downloading. You can download and install the most recent application version in such a case. To manually update the application, please follow the below steps:

- 1. Stop the current application.
- 2. Backup the following files: 'C:\Program Files\Virima Discovery
 Application\cat.json,' 'C:\Program Files\Virima Discovery Application\hcm.json,'
 'C:\Program Files\Virima Discovery Application\session.txt,' and 'C:\Program
 Files\Virima Discovery Application\config\configuration.xml.'
 - 3. Uninstall the application.
- 4. Delete the old application record from https://servicemappingyourregion.ivanticloud.com/www_em/pages/probe/?entity=clients.
- 5. Download the latest version of the application from https://servicemapping-yourregion.ivanticloud.com/www_em/pages/adminHome/?entity=adminHome.
 - 6. Install the latest version of the application.
 - 7. Replace the backed-up files.
- 8. Under Windows Services log-on, please add the service account permissions for the Virima Discovery Application.
 - 9. Start the application as an administrator.
- 10. Verify that all the required credentials are active in the discovery application credential section.

V5.11 (June 2024)

Service Mapping	New feature or enhancement
Discovery	 Enhanced functionality to identify Network Interfaces on Switches. Implemented functionality to discover RedHat JBoss running services. Streamlined Vulnerability Management processes for improved efficiency. Expanded capabilities to recognize Aruba Switches during discovery. Extended support for discovering Dell Switches within the network. Implemented PowerShell JEA support to enable discovery of Windows machines. Optimized discovery process for IIS websites and their associated applications. Added support to include multiple ports for each scan type.
CMDB	 Enabled Network view for all blueprint types in Business Service Map. Revised relationships from IIS Websites to Applications in Process DevOps. Introduced a new vulnerability tab to provide detailed information on associated vulnerabilities for respective configuration items (Cls). Implemented functionality to abort process jobs.
Integrations	Properties in the mapping page condition block are displayed based on their respective types.
Admin	 Implemented auto-reordering functionality in the CMDB Properties module. Enhanced import capabilities by adding support for importing Azure resources via Azure Management Group Id.

Reports	 Expanded import capabilities by adding support for importing AWS resources via Root and Organization units. Enhanced user import functionality in the User Management module to consider email as the username when username is not present. Implemented a hidden enable field for apply-to-existing in the Business Rules module, improving user experience. Enabled users to deactivate schedules in the Azure and AWS imports without requiring additional inputs. Email reports will now include a link to download the report
	instead of attachments
Discovery Application & Agent	 Discovery Application (v1.0.4017) & Agent (v1.0.112): Added support for PowerShell scan. Added support for bulk activation of credentials. (Note: requires Discovery App version 1.0.4017 or higher)

Discovery	 Resolved the issue where the agent status remained connected even after the Discovery application went down. Fixed the problem with scanning subnets when Nmap is enabled. Resolved the issue with scanning subnets when scan through Agent and Nmap is enabled. Fixed the issue with installing agents when Nmap is enabled. Resolved the issue related to importing scheduled records with an IP-range parameter exceeding 1024 IPs in the Excel per schedule. Fixed the incorrect time format displayed for the Last Scanned On property. Resolved the issue of duplicate and host down logs being printed in the logs tab in the recent scan module. Fixed the problem where Azure AD User Import Scans on view of "new users" link displayed all users instead of newly imported users. Resolved an issue where an incorrect CI was associated with an agent when moving CIs to the CMDB. Fixed an issue related to Agent proxy.
CMDB	Resolved an issue that caused duplicate CIs to be created upon merging.
Integrations	 Resolved an issue in Ivanti Sync where moving a software instance component would trigger an exception. Updated ServiceNow Mappings to display both the display name and table name for ServiceNow table names. Fixed the display issue in CMDB where Changes were incorrectly labeled as 'Incident Id' instead of 'Change Id' for ServiceNow.

- Implemented a solution in ServiceNow integration to automatically create an Virima API key if the logged-in user does not have one during ServiceNow credential save.
- Addressed ServiceNow Incidents and Changes API issues.
- Fixed a bug where 'OLA' was incorrectly set as the default value for Cherwell object on new mappings creation.
- Resolved a JavaScript error encountered when clicking on new Cherwell mapping.
- Fixed the issue in Cherwell credentials module where entering and saving a new API key would still retrieve the old API key from the database.
- Fixed a bug in Cherwell mappings page where changes in Cherwell property mappings were not reflected properly.
- Fixed a display issue in Sync Logs where Jira fields were shown twice after filtering and applying some fields from personalized columns.
- Fixed a bug in Jira sync where CIs with the same asset name copied separately would create duplicates in Jira.
- · Improved error messaging and alerts in Jira.
- Fixed an issue in Jira Incident and Change Mappings where added properties were not displayed when 'Reporter' was selected for Jira Property.
- Implemented a solution in Jira to pull Issues to Virima independently of the presence of CIs in Jira when 'Custom' is selected.
- Fixed pagination issue in Jira CMDB to display all Issues under Incidents and Changes.
- Addressed configuration issues in Jira Credential page.

Admin

- Adjusted the date format for 'Triggered At' and 'Import Completed At' fields in the exported AD configuration data.
- Fixed issues with AD and Azure AD filters.
- Fixed validation and alert issues for AWS, Azure, and Meraki credentials on the credential page.
- Fixed a refresh issue in User Management module.
- Implemented restrictions on Group order, property order, priority, and UI order number to accept up to 3 digits in CMDB properties module.
- Fixed a problem where Action blocks were failing to trigger via Event Management.
- Fixed phone number field formatting issue on the Organization details page.
- Fixed filter issues on Users and Credential pages for the active field.
- Fixed an issue with advance search on the landing page in the User module.
- Implemented a fix where selecting 'Associate All Blueprints' now displays all blueprints in the UI in Business Rules.

Reports	Fixed a bug where duplicate reports with the same name were created when reports were scheduled.
General	 Fixed an issue where saved multiple filters and their default settings were not being displayed correctly after saving. Fixed a bug where selected column names were displayed twice in the import mapping popup. Implemented handling of special characters when exporting data from the User Group, Department, and Audits modules.
Discovery Application & Agent	Discovery Application (v1.0.4017) & Agent (v1.0.112): • Fixed issues related to Nmap. (Note: requires Discovery App version 1.0.4017 or higher)

Action required by the user's post-release:

- 1. Clear your browser cache to view any recent updates.
- 2. Sign in to the Service Mappings web application.
- 3. Go to the Admin portal > Client (Discovery) page.

Please note that if you have clicked the update button but your application is still not updating to the latest version, restrictions on your network may be preventing the updates from downloading. You can download and install the most recent application version in such a case. To manually update the application, please follow the below steps:

- 1. Stop the current application.
- 2. Backup the following files: 'C:\Program Files\Virima Discovery
 Application\cat.json,' 'C:\Program Files\Virima Discovery Application\hcm.json,'
 'C:\Program Files\Virima Discovery Application\config\configuration.xml.'
 - 3. Uninstall the application.
- 4. Delete the old application record from https://servicemappingyourregion.ivanticloud.com/www_em/pages/probe/?entity=clients.
- 5. Download the latest version of the application from https://servicemapping **yourregion**.ivanticloud.com/www em/pages/adminHome/?entity=adminHome.
 - 6. Install the latest version of the application.
 - 7. Replace the backed-up files.
- 8. Under Windows Services log-on, please add the service account permissions for the Virima Discovery Application.
 - 9. Start the application as an administrator.
- 10. Verify that all the required credentials are active in the discovery application credential section.

V5.10 (Feb 2024)

Note: You're advised to clear or delete your browser cache before using Ivanti Neurons for Service Mapping post-release.

Service Mapping	New feature or enhancement
Discovery	 Added a standalone probe to discover MSSQL servers without scanning the host server. Enhanced the support to discover host applications configured in IIS redirections (ARR). Added support for JBOSS and its application discovery.
CMDB	 Extended CI import functionality to include Warranty Start Date and Warranty End Date. Added support to include getting connected devices for switches inside the Process Network Connection job. Optimized Software Installation and ADM Process Jobs functionalities.
Integrations	 Enhanced JIRA integration functionality by adding support for filters to choose projects and issue types. Added support to enable/disable mappings in JIRA. Added clone and reset support for JIRA mappings. Added support to reset JIRA integration settings (excluding sync logs). Added support to include communication relationships syncs in ISM. Added an option to reverse sync data from ISM into Virima. Extended support to include Virima Id and Virima Asset ID inside Virima properties in ISM mappings. Added support to encrypt Ivanti and Cherwell API keys for data at rest.
Admin	 Added 'Copy to JIRA' support within Business rules. Added support to autofill property order when a new CI property is added. Added support to import CI properties. Added support to include a 'Select All' option inside Business

	Rule blueprint associations. Renamed the Platform types in 'Discovery Scan configuration' to match scan types rather than Blueprints.
General	Removed global search functionality support.
Discovery Application	 Added support for SHA-2 type key-based authentication. Added proxy support for the discovery agent. Added log rotation support for stderr.log and stdout.log files inside the discovery application. (Note: requires Discovery App version 1.0.4014 or higher)

Discovery	Resolved a challenge with the NMAP scan.
Biodevery	Addressed an issue related to log.txt file rotation in the discovery application and agent.
	 Addressed a situation where AWS import failed to bring in certain attributes from AWS resources.
	Fixed an issue where SSL certificate discovery added certificates without names.
	Addressed an issue associated with Meraki import.
	 Fixed a problem that prevented scheduled tasks from updating when the cron was changed.
	Resolved an issue related to discovery export.
	Addressed an issue where 'Recognized Virtual Machine' was not displayed inside the ESXi CI record.
	Addressed an issue where a duplicate Windows OS type Software CI was created.
	Resolved the issues related to Website Scan Probe.
	 Addressed an issue that failed to display the time for 'Created On' and 'Last Modified On' asset properties in the discovery tabular page.
	 Addressed an issue with an issue related to Azure Import. Resolved an issue where Dell Manufactured CIs failed to retrieve Warranty Date from Dell.
	Addressed an issue where Printer discovery failed when
	Hostname was set as co-relator.
	Addressed an issue that caused the scan results to display
	other scans results when ping check via nmap is enabled.
Integrations	Resolved an issue related to JIRA assets sync.
mogrationio	Fixed an issue that failed to show the 'Remaining Records to Sync' value inside JIRA sync logs.

	 Addressed an issue where certain components failed to sync in ISM. Fixed an issue where Virima Incidents were shown inside JIRA Incidents under CMDB ITSM. Addressed an issue that displayed incorrect sync counts inside Sync logs when a sync is aborted. Fixed an issue that prevented certain object sub-types from appearing inside ISM mapping page.
Admin	 Address a business rule issue causing duplicate discovered assets and Configuration Items (CIs) when the rule included a change blueprint action. Fixed an issue resulting in the creation of duplicate CIs and Components during CI merge. Addressed a problem where some user attributes from Active Directory could not be imported. Resolved an issue where priority/order became mandatory when the business rules trigger was set to 'apply to existing'. Addressed a filter issue within CMDB Property Groups. Fixed filter issues within the Discovery Client page. Addressed an issue that prevented the update of the Country field inside the Organizational details page. Resolved an issue with Hardware properties of CMDB inside Business rules. Fixed an issue where certain user properties were not imported via Active Directory. Addressed an issue where End Users records were not fetched inside Business rules condition and action blocks. Fixed an issue where SAML user modifications were not reflecting inside Virima user records. Addressed an issue preventing users from entering passwords after the user is imported. Resolved an issue where the 'Apply to Existing' action failed inside Business Rules for Request Modules. Addressed an issue where User email preference configuration was not getting updated.
Reports	 Fixed an issue related to export report data. Addressed an issue where certain reports fetched incorrect data when drilled down. Addressed an issue related to Hardware module properties.
General	 Resolved issues pertaining to search filters throughout the entire application. Addressed an issue related to User Department Exports.
Discovery Application	Addressed an issue where the discovery application failed to load the added credentials on application restart. (Note: requires Discovery App version 1.0.4014 or higher)

Action required by the user's post-release:

After the release, please follow these steps to ensure a smooth transition and take advantage of the latest updates:

- 1. Clear your browser cache to view any recent updates.
- 2. Sign in to the Virima web application.
- 3. Go to the Admin portal > Client (Discovery) page.
- 4. Click on the update icon to proceed with updating to version **1.0.4014**.

Please note that if you have clicked the update button but your application is still not updating to the latest version, restrictions on your network may be preventing the updates from downloading. In such a case, you may try downloading and installing the most recent version of the application. To manually update the application, please follow the below steps:

- 1. Download the latest application.
- 2. Backup the files 'C:\Program Files\Virima Discovery Application\cat.json', 'C:\Program Files\Virima Discovery Application\hcm.json', and 'C:\Program Files\Virima Discovery Application\config\configuration.xml'.
- 3. Uninstall the current application.
- 4. Install the latest application.
- 5. Replace the backed-up files.
- 6. Start the application.

V5.9 (Nov 2023)

Note: You're advised to clear or delete your browser cache before using Ivanti Neurons for Service Mapping post-release.

Service Mapping	New feature or enhancement
Discovery	 Added support for CyberArk integration. Added support to fetch Azure SQL managed instances through Azure import. Added Nmap support to identify hosts and host types during scans. Added support to activate/deactivate credentials. Added support for MS SQL discovery via agents. Added support to include status history of the discovery application. Added support to include the status history of the discovery application. Added support for proxy in the Discovery application. (Note:
CMDB	 requires Discovery App version 1.0.4012 or higher) Re-added support for CMDB drop-down type properties.
CIVIDB	 Removed the restriction that disallowed users to assign end users as Owner, and support users.
Integrations	 Added support for syncing assets to Jira Service Management. Optimized Ivanti and Cherwell sync functionality for better performance. Added support to show sync progress inside Ivanti and Cherwell sync logs. Added support for deleting sync log entries for Ivanti and Cherwell. Added support to disable/enable Ivanti and Cherwell mappings. Added email notification to notify the user when a sync is aborted.
Admin	 Enhanced and optimized Hardware, Contract, and Vendor management features. Added additional default ad-hoc reports.

Discovery	A LI
Discovery	 Addressed an issue with IBM AIX servers not getting discovered. Issues with Apache Web Server and Apache Tomcat Server Discovery relationships have been resolved. Fixed an issue where the progress indicator for AWS and Azure imports was not visible.
	Addressed an issue related to an MS SQL Server query scan.
	Fixed an issue where AWS import for EC2 instances displayed empty fields.
	 Scan Total Time has been corrected when exporting a recent scan. Fixed discovery monitoring properties.
	Fixed a bug where the Location field on the Schedule Scan List page would always show an empty value.
	 Fixed an issue where MS SQL discovery was failing in some rare cases. Fixed an issue that failed to fetch a process name for Linux processes. Fixed an issue that failed to fetch a serial number for Linux hosts. Addressed an issue in schedule scan bulk update. Resolved an issue that prevented tags from being associated with imported assets on edit.
	Addressed an issue where the MSQL server was not being
	 discovered via WMIC probe. Addressed an issue that failed to discover certain Cisco Devices. Added the default correlator property to Network Storage blueprint.
	 Addressed an issue where Azure import status was not set to completed.
CMDB	 Fixed an issue related to exporting Software License Keys. Fixed an issue where the blueprints' icons weren't updating when you clicked the update icon on the Blueprint page. Addressed an issue with filters for the time zone property under CMDB Maintenance. Resolved a problem with deleting properties in the CMDB. Resolved an issue with the CMDB property group order. Addressed an issue that allowed users to add duplicate property groups. Addressed an issue in Merge CI that caused duplicate CIs.
Integrations	 Addressed an issue with operators inside mapping conditions. Addressed filter-related issues in sync logs and mapping pages. Fixed a problem where, despite failing, a CI was displayed in both the Success and Failed sections. Addressed an issue where duplicate records were synced in ISM.

	Addressed an issue that failed to retrieve all the sub-types of an object.
Admin	 Addressed an issue where notification was not sent on add/edit/delete locations records. Fixed issues related to business rule condition check. Fixed an issue that allowed users to select invalid operators for Integer and Date fields inside business rules. Addressed an issue where scheduled business rules were triggered along with other rules when cascade was set to true. Addressed an issue in the business rules that caused duplicates when changing the blueprint of the triggered record. Addressed an issue that failed to merge the CI/Assets with the same co-relator value when the CI blueprint is changed.
Reports	 Fixed an issue related to CI relationship queries. Fixed an issue in Custom Reports that showed duplicate values for certain queries.
General	 Fixed an issue related to page auto-refresh functionality. Resolved a problem that prevented the application from showing recently added records at the top.

v2023.3 (July 2023)

Note: You're advised to clear or delete your browser cache before using Ivanti Neurons for Service Mapping post release.

What's new

New features include expanded discovery and relationship mapping for MySQL and Apache servers, enhanced SSL certificate discovery, and several integration improvements for Ivanti Neurons for ITSM and Cherwell Service Manager.

Service Mapping	New feature or enhancement
Discovery	 Added support to import Meraki devices from Meraki Dashboard. Added support for scheduled import for Meraki. Optimized agent module add/delete/search features inside the Discovery Client page. Added support to discover MySQL and Apache servers. Added support for bulk update/uninstall agents inside the Discovery Client page. Added import metrics for Azure user import.
CMDB	 Added feature to manage blueprint custom properties and property groups. Added Region filter inside Business Service Map. Added support to generate extended relationships between AWS Cls. Added a newly enhanced API for CI retrieval. Extended support for SSL certificate notification. Added support to generate relationships between MySQL and Apache servers. Enhanced and optimized default CMDB Summary report for dashboards.
Integrations	 Optimized Ivanti Neurons for ITSM and Cherwell Service Manager sync functionalities for better performance. Added column customization for Ivanti Neurons for ITSM and Cherwell Service Manager Sync Log pages. Removed Virima Asset ID property dependency to retrieve Changes and Incidents from Ivanti Neurons for ITSM. Added sync log default rotation feature that only retains logs from the past 6 months. Added support to re-sync a particular property's pick-list values from Ivanti Neurons for ITSM inside the Virima to ITSM Mapping page. Added feature that restricts performing a sync when the metadata sync is still in progress.
Admin	Added support for runbook inside business rules and graphical workflow.

	 Added oAuth support inside SMTP, Mailbox, and Inbox configurations. Enhanced and optimized Hardware, Contract, and Vendor management features. In Department, Location, Roles, and User Group & User Modules, 'Last Modified On,' 'Created By User,' and 'Last Modified By User' are added to the records.
Users	 Added service-provider-initiated login for SSO users. Added support to handle multiple SAML configurations and their association with users.

Service Mapping	Fix
Discovery	 Fixed a problem where the import schedule scan might fail when a file with special characters was imported. Resolved a rare case issue where SSL certificates on hosts weren't discovered. Added a relevant icon to the database blueprint. Addressed an issue that allowed users to add duplicate schedules for a Windows Discovery Agent. Addressed a problem when a Windows Discovery Agent was archived or deleted, the associated schedule scan was not deleted. Addressed a filter issue in the Discovered Items List page. Addressed a sort/filter issue in the Windows Discovery Agent tab on the Discovery App (Client) page. Addressed an issue where software instance discovery was failing via a Windows Agent scan. Addressed an issue where 'Major Software Name' was not auto-filled when adding major software from installed software or a software instance.
CMDB	 Fixed an issue related to exporting software license keys. Addressed an issue where Basic export was not exporting all columns shown on the list page. Addressed an issue inside 'Change Attributes' that showed a text field instead of a date picker for date properties. 'Last Scanned on' property is now included in the list page column customization. Addressed an issue that prevented users from filtering/sorting the Boolean type properties in the list page.

Integrations	 Addressed an issue related to peripheral device mapping in Ivanti Neurons for ITSM. Addressed an issue where the page went unresponsive while adding Ivanti Neurons for ITSM credentials. Addressed an issue where Ivanti Neurons for ITSM Business Object IDs were not matching upon resetting the mapping. Addressed a few minor user-interface-related issues on the Ivanti Neurons for ITSM and Cherwell Service Manager Mapping pages. Addressed an issue where duplicate records were shown under the Ivanti Neurons for ITSM and Cherwell Incident & Changes tab inside an ITSM CI record.
Admin	Resolved a problem where the business rules were not updating the contracts with the hardware asset that the contract was created from.
Reports	 Fixed a report exporting issue where the capitalization of values was not retained in the exported file. Addressed user-interface-related issues. Addressed an issue that prevented a report from rendering all records matching the conditions when the response had a NULL value.
Users	 Addressed an issue related to user bulk edit. Addressed issues with imported users.

v2023.1 (January 2023)

Note: You're advised to clear or delete your browser cache before using Ivanti Neurons for Service Mapping post release.

What's new

These new features automatically display upon upgrade; they're usually smaller enhancements that do not disrupt daily use for existing customers.

Feature	Description
ITSM/CSM sync optimization	Optimized Ivanti Neurons for ITSM and Cherwell Service Manager (CSM) integration for faster sync performance with the Service Mapping CMDB.
Windows Discovery Agent schedule management	Added ability to manage Windows Discovery Agent schedule jobs from the Discovery App client.
New agentless discovery credentials	Added support for SNMPv3, AES192, and AES256 encryption-type credentials to be used with Service Mapping discovery.
Window Discovery Agent bulk add and delete improvements	Optimized bulk add and delete features for scheduling discovery agent scans.
Status and approval bulk updates	Added support for Status and Approval Status fields to be bulk updated within the Service Mapping CMDB.
Default CI editing	Edits to Service Mapping Cls no longer require the user to enable CI editing first.
CI status updates	CI status in the Service Mapping CMDB can be changed to any state without requiring a sub-state change.
User management	Added support for bulk user edits and updates.
Mailbox improvements	Added mailbox support for Microsoft oAuth and SMTP configuration.
Business rules and reports "within next"	Added support for "within next" operator inside business rules and reports.

These new features are immediately available to all customers but must be specifically configured.

Feature	Description
ITSM relationship and component deletion (BETA)	Added back-end ability to delete relationships and components from the ITSM CMDB that are no longer discovered by Service Mapping discovery (BETA).

Discovered Items "Last Scanned On" property	Discovered Items view now includes a Last Scanned On date showing when the asset was last scanned. Users must configure their personal Discovered Items view to display the date.
CI record "Last Scanned On" property	CI records can now include a Last Scanned On date showing when the asset was last scanned by Service Mapping discovery. System admins must configure which blueprints show the Last Scanned On property.

Fix	Description
Service Mapping CMDB	 Fixed an issue that was preventing the Process Network Connections job from running. Addressed an issue with stop sync for ITSM and CSM. Addressed an issue where a few relationships were not showing up in the Relationship tab for a CI. Addressed an issue where the CI location was not getting updated on move. Addressed an issue where the recycle date was not calculated when a CI was moved.
ITSM integration	 Addressed an issue where relationship copy was failing. Addressed an issue where some picklist properties were not retrieved in the Mapping page.
Discovery	 Addressed an issue where some random discovery scan records threw errors while opening them. Addressed an issue where the scheduled jobs were not getting updated/deleted in some Windows Discovery Agents. Addressed pagination issue in Windows Agent's Tabular page. Removed 'sudo' checkbox in the Credentials page inside the Discovery app and webapp, as this is handled inside probes. Addressed an issue where the restart client function in the Discovery Client page was failing for some clients. Addressed an issue where a few Windows Agents failed to run the scheduled scans when the scan was scheduled for multiple agents.

	 Addressed an issue where the Windows Agent sometimes was not returning IIS website, application, and Hyper-V details. Addressed an issue where the SNMP scan failed to retrieve the serial number for some network device types.
Ad-hoc reports	 Fixed IN and NOT IN operator's functionality issue inside reporting module. Fixed OR operator functionality issue inside reporting module. Addressed an issue where some records were not pulled into the report query due to null values. Addressed an issue that failed to generate the report when more than one WITHIN or NOT WITHIN operator was used in multiple query blocks.
Azure import	Addressed an issue where the Virtual Machine's name was not retrieved for some of the Azure Virtual Machines.
User admin	 Addressed an issue that was always updating the existing user's Active flag to true while importing from Active Directory. Addressed issues related to user group functions for sort and filter.
Business rules	 Fixed inside rule Actions, Hardware Asset, and License key search issue. Fixed update triggered record action issue inside.
General	Addressed an issue related to uploading attachments throughout the application.
