Introduction

This guide provides details for how to use the Xtraction Data Model Editor tool to configure a data model for use with Xtraction. Xtraction uses the data model file, named **DataModel.dat**, to connect to the various data sources it reports on.

A data model is made of the following objects:

- Data source: An application database that Xtraction is connected to.
- View: A segment of the data within a data source.
- **Table**: A table contained within a view. A table can be a physical data source object (i.e., a database table or database view) or if the DBMS allows, a virtual object (i.e., SQL statement).
- **Field**: A field contained within a table. A field can also be a physical or virtual object (i.e., SQL expression).

Starting the Data Model Editor

During the Xtraction installation process, the Data Model Editor files (.exe and .lic) are placed in the ...\Program Files\Xtraction Software\Xtraction\Tools folder on your Xtraction application server.

The Data Model Editor is licensed for use on a specific computer based on the value of the HOSTNAME environment variable. The tool will fail to start if a valid **DataModelEditor.lic** file is not installed and located in the ...\Tools folder mentioned above.

NOTE: Most users remotely connect to the server and run the DataModelEditor.exe from the server itself. For details about running the Data Model Editor from a different computer, see this knowledge article <u>How</u> <u>do I install the DME on my workstation?</u>

Start the Data Model Editor by running the **DataModelEditor.exe** file. The file will take a moment to launch as it loads controls and libraries – so be patient.

The Data Model Editor initially opens with no data model loaded and displays an empty window. The sample window shown below has a data model loaded for instructional purposes. There are four separate areas within the main window:

Edit Tools														_	
Model	Ψ X	Summary													
🗊 Data Model		Field	Data Type	Expression	Α	G	L	S	UN F	A	= DF	DD	υTU	E DN	1

Menu bar: Although the menu options are reasonably self-explanatory, they will be covered further in the examples included throughout this guide.

Status bar: Located at the bottom of the main window, this bar displays the path and name of the current data model file, as well as the current language and version.

Data source pane: The left pane lists the data sources added to the open data model file. You can expand the tree view to see the views contained within the data sources, and tables contained within the views. Tables and URLs are grouped in folders.

Double-click a listed data source, view, or table to open a dialog for that object. When you select a table in the data source pane, the fields associated with that table are listed in the field pane on the right.

To add a new data source, right-click in the background or right-click a data model label to access a context menu. To add a new view, right-click a data source label. Right-click context menus exist for the other tree items as well and are explained later in this guide.

Field pane: The right pane displays a grid view of the fields contained within the table currently selected in the data source pane. The table is identified in the header, which is in the format **data source \ view \ table**. The table name is displayed using the text attribute, followed by the table attribute in parentheses.

S	ummary														
Fie	elds - CA Service Desk \ Incidents \	REQUEST (DBO.	CALL_REQ)												
	Field	Data Type	Expression	Α	G	L	S	UN	F	AF	DF	DD	σ	UE	DM
Þ	Request PK	NUMBER	REQUEST.ID	1											
	Туре	STRING	REQUEST.TYPE	1											
	PersId	STRING	REQUEST.PERSID	1											
	Number	STRING	REQUEST.REF_NUM	1		1			1						
	Summary	STRING	REQUEST.SUMMARY	1		1			1						
	Status FK	STRING	REQUEST.STATUS	1											
	Active	STRING	CASE REQUEST.ACTIVE_FLAG WHEN 1 THEN 'Yes' ELSE	1	1	1			1						
	Open Date	NUMBER	REQUEST.OPEN_DATE	1		1			1		1	1	1	1	

The attributes of each field in the table are displayed in a grid and are explained in detail later in the guide:

A = Active	S = Summary	AF = Admin filter	UT = UTC date
G = Group	UN = Unicode	DF = Date filter	UE = UNIX epoch
L = List	F = Filter	DD = Default date	DM = Data model

Editing a data model

You can use the Data Model Editor to create and modify the data model needed for your environment. Because the data model file (DataModel.dat) enables the connection between Xtraction and a specific type of data repository, it's often referred to as a **connector**.

Ivanti provides two types of pre-built connectors whose settings you can edit in the Data Model Editor after downloading:

- Connectors for Ivanti's own products, provided free of charge and available from the <u>Connector</u> <u>Downloads</u> site (where you must first register to log in).
- Connectors for third-party products, licensed separately and available from the <u>Ivanti License Portal</u> (where you must sign in with the credentials provided by Ivanti).

For a list of available connectors (last updated January 2021), see the PDF Ivanti Xtraction Connectors.

For details about the process of downloading the connectors, see the knowledge article <u>How to download</u> <u>Xtraction licenses and connectors from Ivanti</u>.

When constructing a new data model file, you can either start from an empty file or copy an existing file to modify. In either case, you can copy objects between or within data model files.

Before editing a data model file, always make a backup copy in case you need to reload the previous model to revert your changes. Save files in the ...\Program Files\Xtraction Software\Xtraction\Data\Configuration\ folder.

NOTE: In the following sections, the options for File > New, Add Data Source, and Add View are only available if you have purchased an Enterprise Data Model Editor license.

Creating a new data model

The Data Model Editor starts without a pre-configured data model loaded, which enables you to build and save a new data model file from scratch.

When starting from an empty data model, you'll need to create the data sources, views, tables, fields, etc., as described in the following sections.

At any time, you can discard the current data model and revert to an empty data model by clicking the **File** > **New** menu.

Creating a new data source

Right-click anywhere in the data source pane and select **Add Data Source**. The Data Source dialog displays, enabling you to enter various details pertaining to the data source, as required by Xtraction.

🔜 Data So	ource		×
ID			_
Text	en-US		
Database	SQL Server		•
Connection	(No connection setup)		
	✓ Active		
Views			
	View		Active
		ОК	Cancel

- ID: A text field used to identify the data source internally. Enter text strings in uppercase letters (and optionally numbers) with no other characters except underscores, which should be used for spacing (e.g., CA_CMDB).
- **Text**: A text field used to identify the data source in the user interface (i.e., the Data Model Editor and Xtraction). These text strings do not have the same restrictions as the ID attribute and may contain mixed case letters, spaces, and special characters.
- **Database**: From the drop-down list, select the relevant database management system for the data source.
- **Connection**: Specify the details necessary for Xtraction to connect to the database. Click the ellipsis button to open the Connection Details dialog, where you can specify the server and database names, user ID and password, etc. Additional information is optional. Click **Test** to initiate a connection to the database. If successful, you'll see a box pop up that confirms the connection details work.
- Active: A binary field that enables you to work on new data sources and keep them inactive until they're complete and ready to integrate with Xtraction. When the data source is ready to integrate, click the Active option.

You can add views to the data source as detailed in the following section.

Creating/editing a view

To create a new view for a data source, double-click a data source name in the data source pane. From the open Data Source dialog, right-click in the **Views** tab area and click **Add**. The View dialog displays, as shown below.

View							×
ID	CON	FIGURATION_ITEMS	;				
Text	en-l	US Configuration Ite	ms				
	V A	ctive					
Tables	URLs	Default List Fields	Filters	Sub Qu	ery Links		
	Table					Active	
					ОК	Cance	1

- ID: A text field used to identify the view internally. Enter text strings in uppercase letters (and optionally numbers) with no other characters except underscores, which should be used for spacing (e.g., CONFIGURATION_ITEMS).
- **Text**: A text field used to identify the view in the user interface (i.e., the Data Model Editor and Xtraction). These text strings do not have the same restrictions as the ID attribute and may contain mixed case letters, spaces, and special characters.
- Active: A binary field that enables you to work on new views and keep them inactive until they're complete and ready to integrate with Xtraction. When the view is ready to integrate, click the Active check box.

The View dialog also includes tabs for customizing the tables, URLs, default list fields, sub query links, and filters defined for the view.

View dialog > Tables tab

Right-click in the Table tab area to add, edit, or delete tables associated with the view. Details about adding and editing tables is covered in a section below.

When multiple tables have been added to a view, you can select a table in the list and right-click to move the table up or down the list. When you have many tables, it's good practice to reposition them in the list to maintain a rational order.

View dialog > URLs tab

Right-click in the URLs tab area to specify the URLs associated with the view. The URLs can enable Xtraction users to launch other resources (e.g., application windows) in context by double-clicking entries in an Xtraction record list.

	CA_SERVICE_DESK_RECORD
xt	en-US CA Service Desk Record
JRL	http://win2008_r2/CAisd/pdmweb.exe?OP=SHOW_DETAIL+FACTORY=nr+PE
	✓ Active
Fie	Ids
со	NFIGURATION_ITEM Configuration Item PK Add
+	CONFIGURATION_ITEM Url Id

- ID: A text field used to identify the URL internally. Enter text strings in uppercase letters (and optionally numbers) with no other characters except underscores, which should be used for spacing (e.g., CA_SERVICE_DESK_RECORD).
- **Text**: A text field used to identify the URL in the user interface (i.e., the Data Model Editor and Xtraction). These text strings do not have the same restrictions as the ID attribute and may contain mixed case letters, spaces, and special characters.
- URL: A text field used to specify the full URL. The URL can refer to one or more fields from the data returned. You can add fields from the data model by selecting them from the drop-down lists and clicking the Add button.

To reference a field within the URL string, you need to refer to a field's position, beginning at 0. In the example above, there is one field set up, **Url Id**, and it's being referenced in the URL string via {0}: http://win2008_r2/CAisd/pdmweb.exe?OP=SHOW_DETAIL+FACTORY=nr+PERSID=nr:{0}

If a second field had been set up, it could be referenced in the URL string as {1}.

• Active: A binary field that enables you to work on new URLs and keep them inactive until they're complete and ready to integrate with Xtraction. When a URL is ready to integrate, click the Active check box.

View dialog > Default List Fields tab

Specify the default fields and the order in which they're presented when records from the view are displayed within lists in Xtraction. To modify the list fields, right-click in the Default List Fields tab area and select **Edit**. The Select Fields dialog displays, allowing you to select and order the default list fields.

Select Fields		×
Fields	Selected Fields	1
Alt CI ID Cabinet Location Cost Center DNS Name Expiry Date Financial Reference Floor Host Name IP Address License Number MAC Address Maintenance Organization Maintenance Vendor Notes Priority Product Version Quantity Responsible Organization Responsible Vendor	Name Family Class Contact Acquire Date Installation Date Location Manufacturer Model Active	
	OK Close]

You can select any of the available fields in the left column and drag them over to the right column.

You can't reorder or delete fields in this dialog, but you can do so back on the Default List Fields tab using the right-click menu as shown below.

	ID	CON	FIGURATION_ITEM	S			
	Text	en-l	US Configuration Ite	ems			
		V 4	Active				
Ta	bles	URLs	Default List Fields	Filters	Sub Query Links		
		Defau	lt List Fields				4
	0	CI Nar	me				
	1	Family					
	2	Class					
Þ	3	Conta	ct	Γ	e r.	7	
	4	Acquir	e Date		Edit		
	5	Install	ation Date		Delete		
	6	Locatio	on		Clear		
	7	Manuf	facturer		Move <u>up</u>		
	8	Model			Move down		-
					Move to		

View dialog > Filters tab

You can specify filters that should be applied to the view when Xtraction retrieves record data. To modify the filters, right-click in the Filters tab area and select from options to add, edit, or delete.

The Filter dialog will display if you're adding or editing a filter, as shown in the image below. You can then right-click in the Conditions pane and select **Add Condition**.

<mark>문</mark> Filte	r		×
Туре	Automatic		-
F	ilter (AND)		
		Add Group	
		Add Condition	
		Edit	
		Delete	
		Clear	
		ОК С	ose

An example of the Filter Condition dialog is shown below.

🔡 Filter Co	ndition		×
Field	Active	Ŧ	
Operation	Equals	Ŧ	
Value	1]
		_	
	OK Cancel		

Set the **Field** and **Operation** from the drop-down lists. Set the **Value** according to the field values you want to filter in the record data returned by Xtraction.

View dialog > Sub Query Links tab

Sub query links are used as the basis for sub query filter conditions within Xtraction (for details, see the online User Guide). Think of a sub query filter condition as a filter within a filter, and for Xtraction to join the main filter with the sub query filter condition, a link between fields is required. Sub query links are mainly used in situations where there is a one-to-many type relationship. They allow filter conditions to be set up on the many side without returning multiple records.

To add a sub query link, right-click in the Sub Query Links tab area and select **Add**. To edit an existing sub query link, double-click the link text.

🔡 Sub Qu	ery Link		X
Id	REQUEST_ACTIVITY_LOG		
Text	en-US Request - Activity Log		
Parent	PersId		
Child	Request FK		
		OK Cancel	

Like other objects within the data model, you need to provide an ID and text. The text you enter will be displayed within Xtraction when a user sets up a sub query filter condition. Lastly, select the two fields that are to be linked together. Click **OK** to create the link.

Creating/editing a table

To create a new table for a view, double-click the data source view name in the data source pane.

From the View dialog, right-click the **Tables** tab and select **Add**. The Table dialog will display, enabling you to enter various details pertaining to the table, as required by Xtraction.

🔛 Table		×
ID	AFFECTED_END_USER	_
Text	en-US AFFECTED_END_USER	
Table	CA_CONTACT	
Schema	DBO	
Alias	AFFECTED_END_USER	
	✓ Active	
Fields	Joins Filters	
	Field	Active
	ок	Cancel

Fill in the following fields:

• ID: A text field used to identify the table internally. Enter text strings in uppercase letters (and optionally numbers) with no other characters except underscores, which should be used for spacing (e.g., AFFECTED_END_USER).

- **Text**: A text field used to identify the table in the user interface (i.e., the Data Model Editor and Xtraction). These text strings do not have the same restrictions as the ID attribute and may contain mixed case letters, spaces, and special characters.
- **Table**: A text field used to select the applicable table within the database.
- **Schema**: A text field used to select the applicable schema within the database.
- Alias: A text field used to provide an alternate query alias for the table.
- Active: A binary field that enables you to work on new tables and keep them inactive until they're complete and ready to integrate with Xtraction. When a table is ready to integrate, click the Active check box.

Table dialog > Fields tab

The Fields tab enables you to add, edit, or delete fields by using a right-click menu. When multiple fields have been added to a table, you can use the same menu to move fields up or down the list. When you have many fields, it's good practice to reposition them in the list to maintain a rational order.

The **Expression Find & Replace** option on the right-click menu enables you to locate and replace text strings. It's explained in a section below.

•	Ta	ble			×
Γ		ID	CONFIGURATION_ITEM		
	Т	ext	en-US CONFIGURATION_ITEM		
	Та	able	CA_OWNED_RESOURCE		
	Sche	ema	DBO		
	A	lias	CONFIGURATION_ITEM		
			✓ Active		
	Fie	lds	Joins Filters		
ſ			Field		Active 🔺
		0	Configuration Item PK		
	۲	1	Url Id	Add	
		2	CI Name	Add <u>C</u> alculat	ed
		3	Class FK	Add (Databa	se <u>L</u> ookup)
	_	4	Family FK	Edit	
		5	Active	Delete	
	_	6	Serial Number	Expression Fi	nd & Replace
	_	7	Alt CI ID Host Name	Move up	•••••••••••••••••••••••••••••••••••••••
	_	8	Host Name	Move down	
1	-			Move to	
			l		
	_	_			

The **Add** option is useful when you're designing a field that's not in the database or when you're currently unable to connect to the database. The attributes are explained in a section below.

When adding a field, only two of the attributes are preset (you may need to change the Data type) and one attribute is partially preset (you'll need to complete the Expression).

🖳 Field	The second second			×
ID	1			
Text	en-US			
Expression				
Data type	String			
Description				
	General	List	Summary	🔲 Unicode
	Filters	Admin filter	Data model	filter
	Dates	Default date	UIC date	UNIX epoch
			ОК	Close

When you can connect to the database, the **Add (Database Lookup)** option can interrogate the database for available fields and preset more attributes for your selected field.

When selecting the Add (Database Lookup) option, an Add Fields dialog displays, as shown in the image below. Database fields are displayed in the left pane, and you can drag one field at a time into the New Fields pane on the right.

Note that you can filter the database field list for fields containing a specific value (below, the list is filtered to display fields containing "pr" in their name).

pr	Priority FK
incident_priority (int) macro_predict_viol (int) predicted_sla_viol (int) priority (int) problem (nvarchar) z_project_release (int)	

As you drag each field into the right pane, a Field dialog opens with preset attributes for the selected database field, as shown in the next image.

ID	PRIORITY_FK				
Text	en-US Priority F	ĸ			
Expression	REQUEST.PRIOR	ITTY			
Data type	Number				-
Description					
	✓ <u>A</u> ctive General	List	Summary	🔲 Uni <u>c</u> ode	
	Filters	Admin filter	Data model	filter	
	Dates	Default date	UIC date		och

- ID: A text field used to identify the field internally. Enter text strings in uppercase letters (and optionally numbers) with no other characters except underscores, which should be used for spacing (e.g., PRIORITY_FK).
- **Text:** A text field used to identify the field in the user interface (i.e., the Data Model Editor and Xtraction). These text strings do not have the same restrictions as the ID attribute and may contain mixed case letters, spaces, and special characters.
- **Expression**: A text field used to specify the SQL syntax required to return the desired value. Click the ellipse button to enlarge the edit box into a multi-line edit window. The simplest form of these expressions is written in the TABLE.FIELD format, as shown above (i.e., REQUEST.PRIORITY). Examples of more complex expressions are detailed in the Examples of Complex Fields section of this guide.
- **Data type**: Select from a drop-down list with options including String, Number, Date, Boolean, and Binary. An Other option is for unlisted data types, which may require non-standard expressions.
- **Description:** A text field used to display a description or tooltip in Xtraction when the mouse hovers over the column in various places including a List Component column. Click the ellipse button to enlarge the edit box into a multi-line edit window.

The remaining attributes are binary fields set by either checking or clearing a check box:

- Active: Enables you to work on new fields and keep them inactive until they're complete and ready to integrate with Xtraction.
- **Group**: Determines whether the field is included as a Group field in Xtraction.
- List: Determines whether the field is included as a List field in Xtraction.
- **Summary**: Determines whether the field is included within the Summary Options in Xtraction.
- **Unicode**: Determines whether the field is treated as a Unicode field in Xtraction.
- Filter: Determines whether the field can be included within Filter Conditions in Xtraction.

- Admin filter: Determines whether the field can be included within Admin Filters in Xtraction.
- **Data model filter**: Determines whether the field can be included within Data Model Filters in Xtraction.
- Date filter: Determines whether the field can be included within Date Filters in Xtraction.
- **Default date**: Determines whether the field can be included within the Default Date Filters in Xtraction.
- UTC date: Determines whether the field is treated as a UTC Date field in Xtraction.
- **UNIX epoch**: Determines whether the field is treated as a UNIX Epoch Date field in Xtraction.

Click **OK** when finished. You will still need to save the data model file.

Table dialog > Fields tab > Expression Find & Replace

The Expression Find & Replace option is available by right-clicking in the Fields tab area of the Table dialog.

🛃 Table		<u>×</u>
ID	REQUEST	
Text	en-US REQUEST	
Table	CALL_REQ	
Schema	DBO	
Alias	REQUEST	
	Active	
Fields	Joins Filters	
	Field	Active 🔺
▶ 0	Request PK	Add

2	PersId	Edit
3	Number	Delete
4	Summary	
5	Status FK	Expression Find & Replace
6	Active	Move up
7	Open Date	Move down
8	Total Activity Time (hours)	Move to
		OK Cancel

Use this feature to search for a specific string of characters in the Expression attributes of all fields within the table and replace those characters with a new string.

A practical use of this feature would be to change all references to a specific table or field in all field expressions within the table after renaming a table or field. (See example below.)

Another use would be to change all references to a specific database function or feature after copying objects from one type of database (e.g., Oracle) to another (e.g., SQL Server). For example, you could replace all occurrences of SUBSTR with SUBSTRING.

The example shown below assumes you're renaming the REQUEST table to CALL_REQ and want to update all field expressions accordingly.

Enter a Find string of **REQUEST** and a Replace string of **CALL_REQ**. Note the Find string is case sensitive.

🔡 Find & Replace	<u>.</u>	×
Find

Table dialog > Joins tab

Use the Joins tab to add, delete, or edit table joins.

🛃 Table	×
ID	AFFECTED_END_USER
Text	en-US AFFECTED_END_USER ····
Table	CA_CONTACT
Schema	DBO
Alias	AFFECTED_END_USER
	✓ Active
Fields	Joins Filters
Join	
	Add
	Edit
	Delete
	OK Cancel

Joins are necessary when you need to retrieve data from other tables.

For example, the Affected End User field in the Request table may contain an identifier to a record in the Contact table. The First Name and Last Name fields are stored in the Contact table, along with other data.

In these situations, a field like the Affected End User field is known as a **foreign key**, because it contains an identifier to a separate table. The identifier in the Contact table is known as a **primary key**, because it identifies reference data that other tables access via foreign key joins.

You can add an AFFECTED_END_USER table to the REQUEST table, as shown above. This table can be used to return the user's name and any other fields stored in the Contacts table.

🔜 Join			×
Table AFFECTED_END_USER	Join table	ASSIGNEE_FUNCTIONAL_OR	. •
Join type			
Left Outer			-
Join conditions			
	(المادية) إداره		
	Add (Field)		
	Add (SQL)		
	Edit		-
	Delete	OK Close	2
	t :		

You can also add joins to this AFFECTED_END_USER table to return fields stored in other tables, like the Organization linked to the user. This example will be explained further as this join is constructed below.

When adding a new join, the details are entered in the Join dialog. By right-clicking and selecting **Add** (Field) you can add a field join, then select the fields to join together (shown below). Additionally, you can add SQL criteria to the join by selecting **Add** (SQL).

🔡 Field Join Condition		×
AFFECTED_END_USER	ASSIGNEE_FUNCTIONAL_ORGANIZATION	
Affected End User PK Affected End User Inactive Affected End User Functional Organization FK Affected End User Administrative Organization Affected End User Location FK	Assignee Functional Organization PK Assignee Func Org Inactive	
Affected End User Department FK	OK Cancel	

You need to select the Foreign Key field in the current table of interest (e.g., Affected End User Functional Organization FK in the above image) and the Primary Key field in the join table (e.g., Affected End User Functional Organization PK). By convention, the Foreign Key fields have a "FK" suffix added to the ID and Text attributes and the Primary Key fields have a "PK" suffix.

Click **OK** to build the join condition after selecting the two fields that define the join. The new join will be added to the Join conditions attribute, as shown below.

Table	AFFECTED_END_USER	Join table	ASSIGNEE_FUNCTIONAL_O	R
oin typ	e			
eft Ou	ter			
oin con	ditions			
ffecte	d End User Functional Organizat	tion FK -> Assignee	Functional Organization PK	
ffecte	d End User Functional Organizat	tion FK -> Assignee	Functional Organization PK	
Affecte	d End User Functional Organizat	tion FK -> Assignee	Functional Organization PK	
Affecte	d End User Functional Organizat	tion FK -> Assignee	Functional Organization PK	
Affecte	d End User Functional Organizat	tion FK -> Assignee	Functional Organization PK	

In this example, we're defining a new join to retrieve the functional organization associated with the affected end user. To achieve this, we must first create a new join table, which is added to the View dialog > Tables tab for the INCIDENTS view, as shown below.

	ID			
Text		en-US Incidents		
		Active		
Tal	bles	URLs Default List Fields Filters S	ub Query Links	
		Table		tive 🔺
Þ	0	REQUEST		
	1	STATUS		v
	2	ROOT_CAUSE		v
	3	REPORTED_BY	elete	V
	4	REPORTED_BY_FUNCTIONAL	ove up	V
	5	REPORTED_BY_ADMINISTRA	ove down	v
	6	REPORTED_BY_LOCATION M	ove to	V
	7	REPORTED_BY_DEPARTMENT		v
	8	ASSIGNEE		v

In our example, we have an AFFECTED_END_USER for an incident, and we want to retrieve the associated FUNCTIONAL_ORGANIZATION linked to that contact record.

By convention, we name the **ID** and **Text** attributes of the new join table by concatenating the source field and the target field, all in uppercase, with words separated by the underscore character (i.e., AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION in the image below).

🛃 Ta	able		2		
ID AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION					
1	Text	en-US AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION	•••		
Table CA_ORGANIZATION					
Sch	ema	DBO			
,	Alias	AFFECTED_END_USER_FUNC_ORG			
		✓ Active			
Fie	elds	Joins Filters			
		Field	Active		
Þ	0	Affected End User Functional Organization PK			
	1	Affected End User Func Org	V		
	2	Inactive	v		
		ок	Cancel		

The **Table** is CA_ORGANIZATION and the **Schema** is DBO. Notice the **Alias** is set to AFFECTED_END_USER_ FUNC_ORG, which is a shortened version of the full name.

On the **Fields** tab, we can add fields to our join table. In our example, we have three fields, as shown in the image above. These fields are explained below.

The first field is typically the Primary Key field, which in our example has the **ID** attribute of AFFECTED_END _USER_FUNCTIONAL_ORGANIZATION_PK.

• Field			-		X			
ID	AFFECTED_END_	FFECTED_END_USER_FUNCTIONAL_ORGANIZATION_PK						
Text	en-US Affected	End User Functiona	l Organization PK					
Expression	AFFECTED_END_	USER_FUNC_ORG.	ORGANIZATION_	JUID				
Data type	Binary				-			
Description								
	General	List	Summary	Uni <u>c</u> ode				
	Filters	Admin filter	Data m <u>o</u> del f	ilter				
	Dates	Default date		2	och			
			OK	Close				

The **Expression** identifies how to access the field value (e.g., using the TABLE.FIELD syntax) and the **Data type** attribute indicates the type of data (e.g., Binary).

Since this is an internal UUID field, the only check box attribute we set is **Active**, because the field is used only to facilitate the join and doesn't need to be exposed to users.

The second field in our example is the main target field, which has the **ID** attribute of AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION.

ID	AFFECTED_END	USER_FUNCTIONA	L_ORGANIZATIO	N	
Text	en-US Affected End User Func Org				
Expression	AFFECTED_END	USER_FUNC_ORG.	ORG_NAME		
Data type	String				
Description					
	General <u>G</u> roup Filters	☑ List	Summary	Uni <u>c</u> ode	
	Eilter	Admin filter	Data model	filter	
	Dates				
	Data films	Default date	UTC date	UNIX epoch	
	<u>Date niter</u>	The Frence of the			

The **Expression** identifies how to access the field value (e.g., using the TABLE.FIELD syntax) and the **Data type** attribute indicates the type of data (e.g., String). The **Description** is a text field used to display a description or tooltip in Xtraction when a mouse hovers over the column in various places, including a List Component column.

Since this is a target field exposed to Xtraction users, we set the check box attributes for **Active**, **Group**, **List**, and **Filter**, which are applicable to this particular String field.

Additional target fields can be added just like this one if we need to expose other columns accessible from the same database table. For example, while we're retrieving the name of the organization via this join, we could also retrieve the associated telephone number, email address, or cost center, and expose these additional fields to users.

The third field in our example has been added to enable filtering. The **ID** attribute is set to INACTIVE, and the **Text** attribute is set to Inactive.

en-US Inactive				
and the second se				
AFFECTED_END_	USER_FUNC_ORG.	INACTIVE		
Number				
General	List	Summary	🔲 Uni <u>c</u> ode	
Filters	Admin filter	Data model f	filter	
Dates	Default date	UTC date		och
	Active General Group Filters Ellter Dates	Vumber Active General Group List Filters Eilter Admin filter Dates		Number

The **Expression** identifies how to access the field value (e.g., using the TABLE.FIELD syntax) and the **Data type** attribute indicates the type of data (e.g., Number).

Since this is an internal numeric field, the only check box attribute we set is **Active**, because the field is used only to facilitate the filter and doesn't need to be exposed to users.

On the **Filters** tab of the Table dialog, we can add filters to our join table. In our example, we've added one filter. This filter uses the third field added above to filter out inactive records and retrieve only those records where Inactive equals 0.

🖳 Table	No.	×
ID	AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION	
Text	en-US AFFECTED_END_USER_FUNCTIONAL_ORGANIZA	TION ···
Table	CA_ORGANIZATION	
Schema	DBO	
Alias	AFFECTED_END_USER_FUNC_ORG	
	Active	
Fields	Joins Filters	
Filter	r	Туре
→ (Ina	ctive Equals 0)	LIST
	ОК	Cancel

We could add additional filters, but if any additional database columns are required to define the filters, we must first add the corresponding fields to our join table.

Now that we have verified the AFFECTED_END_USER_FUNCTIONAL_ORGANIZATION join table has the required fields and filters defined, we can go back to our Join dialog for the new join we're defining on the AFFECTED_END_USER table, as started above.

We selected the Foreign Key field in the current table of interest (e.g., Affected End User Functional Organization FK) and the Primary Key field in the join table (e.g., Affected End User Functional Organization PK), as shown in the image below.

🔡 Field Join Condition	<u>></u>
AFFECTED_END_USER	ASSIGNEE_FUNCTIONAL_ORGANIZATION
Affected End User PK Affected End User Inactive Affected End User Functional Organization FK Affected End User Administrative Organization Affected End User Location FK Affected End User Department FK	Assignee Functional Organization PK Assignee Func Org Inactive
	OK Cancel

By clicking **OK**, the join condition is built, and the new join is added to the Join conditions attribute as shown below.

	AFFECTED_END_USER	Join table		-
		JUIT LADIE	ASSIGNEE_FUNCTIONAL_OR	*
oin type				
eft Out	er			-
oin cond	itions			
Affected	End User Functional Organizati	on FK -> Assiance	Functional Organization PK	
inceace		orrite 2 Assignee		
				_
			OK Close	

Next, we select the **Join type** from a drop-down list, then click **OK** to commit the changes (though the data model file still needs to be saved).

Table dialog > Filters tab

Use the Filters tab to specify filters that should be applied to the table when Xtraction retrieves record data. Right-click in the Filters tab area to add, edit, or delete filters.

🔜 Table				×	
ID	AFFECTED_END	_USER			
Text	en-US AFFECTE	ED_END_USER		•••	
Table	CA_CONTACT				
Schema	DBO				
Alias	AFFECTED_END	_USER			
	Active				
Fields	Joins Filters				
Filte	r			Туре	
		Add			
		Edit			
		Delete			
			_		
			OK	Cancel	

The Filter dialog displays if you're adding or editing a filter, as shown in the image below. You can then right-click in the Filter pane and select **Add Condition**.

When defining a filter condition, you'll need to specify a **Type**, as shown in the image below. Automatic filters are always applied when Xtraction is retrieving data, whereas List filters are applied only when Xtraction is listing entries.

🔛 Filter	•		×
Туре	Automatic		•

		OK Cancel

Examples of complex fields

Most fields modelled for Xtraction are simple to define – enter an **Expression** attribute using straightforward TABLE.FIELD syntax (e.g., REQUEST.SLA_VIOLATION). This simplistic approach proves inadequate in some cases though, since the way some data attributes are stored in the database may not be the way users would prefer to see the values.

In some cases, it's useful to add a level of interpretation over the data to present information to users in a way that's easier to understand. To facilitate this, Xtraction allows the definition of complex field expressions using SQL functions and clauses.

The following examples demonstrate several methods of defining complex field expressions for Xtraction.

Binary Yes/No field

This example shows how to translate a Binary (0 or 1) field into a String field that displays either Yes or No.

In this case, we have a field in the REQUEST table called SLA_VIOLATION, which is a Binary field that contains either 0 or 1 (or NULL, if unset). We want to display the values as either 'Yes' or 'No,' so we define a new field called SLA_VIOLATION_YES_NO.

ID	SLA_VIOLATION_YES_NO						
Text	en-US SLA Violation (Yes/No)						
Expression	CASE WHEN REQ	UEST.SLA_VIOLAT	ION IS NULL THEN '	No' WHEN RE			
Data type	String						
Description							
	General	🗸 List	Summary	Uni <u>c</u> ode			
	Filters	🔲 Admin filter	Data model fil	ter			
	Dates	Default date	UTC date		ch		
			ОК	Close	_		

Instead of using the TABLE.FIELD syntax in the Expression attribute (which is how the SLA_VIOLATION field is defined), we use a CASE statement to translate the values. To view the full query text, click the ellipse button:

CASE WHEN REQUEST.SLA_VIOLATION IS NULL THEN 'No' WHEN REQUEST.SLA_VIOLATION = 0 THEN 'No' Else 'Yes' END

This example is for a SQL Server database. The result of using this field in Xtraction is shown below (the image is from an older version of Xtraction, but the result is similar in more recent versions):

Time field in hours

This example shows how to translate a Number field from seconds into hours.

In this case, we have a field in the REQUEST table called TIME_SPENT_SUM, which is a Number field that contains time recorded in seconds. We want to display the total activity time in hours, so we define a new field called TOTAL_ACTIVITY_TIME_HOURS.

ID	TOTAL_ACTIVITY	TIME HOURS				
	Text en-US Total Activity Time (hours)					
Expression						
	Number				Ŧ	
Description						
	General	☑ List	Summary	Unicode		
	Filters	Admin filter	Data model f	filter		
	Dates	Default date	UTC date	UNIX epo	ch	
			ОК	Close		

Instead of using the TABLE.FIELD syntax in the Expression attribute (which is how the TIME_SPENT_SUM field is defined), we use the ROUND and CAST functions to translate the values. The full query text entered in the Expression attribute is as follows. This example is for a SQL Server database:

ROUND(CAST(CASE WHEN REQUEST.TIME_SPENT_SUM IS NULL THEN 0 ELSE REQUEST.TIME_SPENT_SUM/60.0/60.0 END AS FLOAT), 2)

The result of using this field in Xtraction is shown below (the image is from an older version of Xtraction, but the result is similar in more recent versions).

Incidents 1					
Number	Open Date	Status	Total Activity Time	Summary	
SD:01	12/09/2002 4:00:00	Closed	0	Summary Service Desk Incident None	
AM:11	12/09/2002 4:00:00	Closed	0	Asset Event ITIL Policy High	
AM:12	12/09/2002 4:00:00	Closed	0	Asset Event ITIL Policy Medium	
AM:13	12/09/2002 4:00:00	Closed	0	Asset Query ITIL Policy High	
R)					

Time field in periods

In this example, we want to show how to translate a Date field into segmented periods.

We have two integer fields in the REQUEST table called OPEN_DATE and RESOLVE_DATE, which are Date fields that contain times recorded in seconds (i.e., the number of seconds elapsed since the initial epoch time of 00:00 on 01/01/1970).

To display the time to resolve in segmented periods, we define a new field called TIME_TO_RESOLVE.

🖳 Field	-				X			
ID	TIME_TO_RESOLVE							
Text	en-US Time To Resolve							
Expression	CASE WHEN REQUEST.RESOLVE_DATE IS NULL THEN '10. Not Resol							
Data type	String							
Description								
	General	☑ <u>L</u> ist	Summary	Uni <u>c</u> ode				
	Filters	Admin filter	Data m <u>o</u> del f	îlter				
	Dates	Default date	UIC date	UNIX epo	ch			
			ОК	Close				

Instead of using the TABLE.FIELD syntax in the Expression attribute (which is not that useful for these epoch date fields), we use a CASE statement to translate the values.

To view the full query text entered in the Expression attribute, click the ellipse button. This example is for a SQL Server database:

WHEN REQUES	T.RESOLVE_DAT	TE IS NULL THE	10. Not Res	olved"			
CASE							
WHEN (REOL	EST.RESOLVE	DATE - REQUEST	OPEN DATE	< 600	THEN '01.	< 10 Mins'	
		DATE - REQUEST					-lour'
		DATE - REQUEST					
		DATE - REQUEST					
		DATE - REQUEST					
		DATE - REQUEST					
		DATE - REQUEST					
WHEN (REQUELSE '09. >		DATE - REQUEST					
ND							

Note the period labels contain additional spaces to improve readability.

The result of using this field in Xtraction is shown below (the image is from an older version of Xtraction, but the result is similar in more recent versions).

Concatenation of String fields

This example shows how to concatenate and manipulate String fields.

In this case, we have two String fields in the CUSTOMER table called FIRST_NAME and LAST_NAME. We want to concatenate the two strings, so we define a new field called CUSTOMER.

ID	CUSTOMER				
Text	en-US Customer				
Expression	COALESCE(CUST	OMER.FIRST_NAM		ER.LAST_NAME	
Data type	String				*
Description					
	 ✓ Active General ✓ Group Filters ✓ Eilter 	☑ List	Data model		
	Dates	Default date	UTC date	UNIX epo	ch

Instead of using the TABLE.FIELD syntax in the Expression attribute, we use the COALESCE function to manipulate the strings. The FIRST_NAME field string (if not empty) is concatenated with a space character and the LAST_NAME field string.

To view the full query text entered in the Expression attribute, click the ellipse button. This example is for a SQL Server database:

COALESCE(CU CUSTOMER.FI	STOMER.FIRST_NAME +'' + CUSTOMER.LAST_NAME, CUSTOMER RST_NAME)	R.LAST_NA	ME,
Edit	OK	Cancel	:

Data model Find & Replace

The data model Find & Replace feature is available from the Data Model Editor's **Edit > Find** menu. Enter a character string in the text box on the Find dialog and click the **Find** button. The default behavior is to find the entered text from all the available fields in either of the ID, Text, or Expression fields.

Find results are presented in a grid together with the fields included in the search. The following example uses the word "Urgency" as the find criteria.

F	ind Wha	urgency			Find	
*	Optic	ons				
	Туре	Item	Field Id	Expression	Field Text	Ļ
Þ	Field	CA Service Desk \ Incidents \ REQUEST \ Urgency FK	URGENC	REQUES	Urgency FK	
	Field	CA Service Desk \Incidents \URGENCY \Urgency PK	URGENC	URGENC	Urgency PK	
	Field	CA Service Desk \Incidents \URGENCY \Urgency	URGENCY	URGENC	Urgency	
	Field	CA Service Desk \Incidents \URGENCY \Deleted	DELETED	URGENC	Deleted	
	Field	CA Service Desk \Problems \REQUEST \Urgency FK	URGENC	REQUES	Urgency FK	
	Field	CA Service Desk \Problems \URGENCY \Urgency PK	URGENC	URGENC	Urgency PK	
	Field	CA Service Desk \Problems \URGENCY \Urgency	URGENCY	URGENC	Urgency	
	Field	CA Service Desk \ Problems \ URGENCY \ Deleted	DELETED	URGENC	Deleted	
	Field	CA Service Desk \Requests \REQUEST \Urgency FK	URGENC	REQUES	Urgency FK	
	Field	CA Service Desk \Requests \URGENCY \Urgency PK	URGENC	URGENC	Urgency PK	
	Field	CA Service Desk \Requests \URGENCY \Urgency	URGENCY	URGENC	Urgency	
	Field	CA Service Desk \Requests \URGENCY \Deleted	DELETED	URGENC	Deleted	
	Field	CA Service Desk \ Inc/Prob/Req \ REQUEST \ Urgency FK	URGENC	REQUES	Urgency FK	
	Field	CA Service Desk \Inc/Prob/Req \URGENCY \Urgency PK	URGENC	URGENC	Urgency PK	
	Field	CA Service Desk \Inc/Prob/Req \URGENCY \Urgency	URGENCY	URGENC	Urgency	
	Field	CA Service Desk \Inc/Prob/Reg \URGENCY \Deleted	DELETED	URGENC	Deleted	
	Field	CA Service Desk Admin \Knowledge Documents \DOCUMENT \Urge	URGENC	DOCUM	Urgency FK	
	Field	CA Service Desk Admin \ Knowledge Documents \ URGENCY \ Urgen	URGENC	URGENC	Urgency PK	Ι,

You can double-click any of the listed find results to open a Table or Field dialog for that specific object.

Additional Find options

Additional Find options are available by clicking the collapsible Options panel, as shown in the image above.

Options				
Replace With				Replace
Match Case	Whole Word			
Tables	Fields	Data Source	View	
🔲 ID	ID ID		•	*
Text	✓ Text			
Table Name	Expression			
Schema				

To narrow the above search down to a specific data source, view, and table, we can make the following changes:

	Option Replace W					Replace
	Tables	Case 🔲	Whole Word Fields		View	
	Text Table	Name	Text			
	Туре	Item				Table Id
-	Table	CA Serv	ice Desk \Problems \I	URGENCY		URGENCY

If we need to change the Table ID to something else (e.g., URGENT) we can put "URGENT" in the Replace With text box and click **Replace**. The results from the replace are now shown in the grid:

	Туре	Item	Table Id
Þ	Table	CA Service Desk \Problems \URGENCY	URGENT
Г			1
Ŀ			

When you click an item, the underlying object is displayed, and you can see that the change is reflected in the table. Care should be taken when using Replace. **Remember to back up your data model before making any changes**.

🖳 Ta	able		×
	ID

Sch	ema	DBO	
	Alias	URGENCY	
		✓ Active	
Fie	elds	Joins Filters	
		Field	Active
Þ	0	Urgency PK	
	1	Urgency	V
	2	Deleted	v
		ОК	Cancel

Searching inactive references

As you modify a data model, you may want to make some tables or fields inactive. This is a reasonable thing to do. As of v2016.1, when you make a table or field inactive, there is a check against default list fields, table joins, URLs, and sub query links in case you've forgotten to remove any references to the table or field you're making inactive.

You may already have made tables or fields inactive without removing the references. In this case, there is a search feature to find all the references that use inactive tables or fields.

Open the Data Model Editor's **Edit > Search Inactive Reference** menu to view search results that are presented in a grid with the inactive table or field.

Туре	Item	Table Id	Join Table	Field Text	Field Id	Details
DefaultFieldList	Zendesk With a lo	GROUPS		Ègroup	ÈGROUP	Field ÈGROUP is inactive in DefaultFieldList
Join	Our Service Desk	REQUEST	ROOT_CAUSE			Join Table ROOT_CAUSE is inactive
Join	Our Service Desk	REQUEST	REPORTED_BY			Join Table REPORTED_BY is inactive
Join	Our Service Desk	REPORTED_BY	REPORTED_BY			Join Table REPORTED_BY_FUNCTIONAL_ORGANIZAT
Join	Our Service Desk	REPORTED_BY	REPORTED_BY			Join Table REPORTED_BY_ADMINISTRATIVE_ORGANI
Join	Our Service Desk	REPORTED_BY	REPORTED_BY			Join Table REPORTED_BY_LOCATION is inactive
Join	Our Service Desk	REPORTED_BY	REPORTED_BY			Join Table REPORTED_BY_DEPARTMENT is inactive
Join	Our Service Desk	ASSIGNEE	ASSIGNEE_FUN			Join Table ASSIGNEE_FUNCTIONAL_ORGANIZATION i
Join	Our Service Desk	ASSIGNEE	ASSIGNEE_ADM			Join Table ASSIGNEE_ADMINISTRATIVE_ORGANIZATI
Join	Our Service Desk	ASSIGNEE	ASSIGNEE_LOC			Join Table ASSIGNEE_LOCATION is inactive
Join	Our Service Desk	ASSIGNEE	ASSIGNEE_DEP			Join Table ASSIGNEE_DEPARTMENT is inactive
Join	Our Service Desk	GROUP	GROUP_FUNCTI			Join Table GROUP_FUNCTIONAL_ORGANIZATION is i
Join	Our Service Desk	GROUP	GROUP_ADMINI			Join Table GROUP_ADMINISTRATIVE_ORGANIZATIO
Join	Our Service Desk	GROUP	GROUP_LOCATI			Join Table GROUP_LOCATION is inactive
Join	Our Service Desk	AFFECTED_END	AFFECTED_END			Join Table AFFECTED_END_USER_FUNCTIONAL_ORG
Join	Our Service Desk	AFFECTED_END	AFFECTED_END			Join Table AFFECTED_END_USER_ADMINISTRATIVE
Join	Our Service Desk	AFFECTED_END	AFFECTED_END			Join Table AFFECTED_END_USER_LOCATION is inactive
Join	Our Service Desk	AFFECTED_END	AFFECTED_END			Join Table AFFECTED_END_USER_DEPARTMENT is ina
Join	Our Service Desk	REQUEST	CONFIGURATIO			Join Table CONFIGURATION_ITEM is inactive
Join	Our Service Desk	CONFIGURATIO	CONFIGURATIO			Join Table CONFIGURATION_ITEM_CLASS is inactive
Join	Our Service Desk	CONFIGURATIO	CONFIGURATIO			Join Table CONFIGURATION ITEM FAMILY is inactive

You can double-click any of the listed search results to open the View or Table dialog that gives you access to the default list fields, table joins, URLs, and sub query links associated with the search result.

Connection String Editor

A utility to edit the connection strings for each data source is available from the Data Model Editor's **Tools > Connection String Editor** menu.

To edit the connection string of an individual connection, click the ellipsis button on the appropriate row and adjust the connection properties as required.

If you need to set the same connection string for multiple data sources, select the check boxes for the connection strings you want to overwrite. Then right-click the connection string to copy, and select **Copy to selected**, as shown in the example below.

🕂 Co	onnec	tion String Editor		X
		Data Source	Connection

		Adventure Works	Server: localhost, Database: AdventureWorks, User: xtraction	
			ок с	ancel

URL Editor

The Data Model Editor provides a feature to globally edit the URLs recorded in a data model. To access this feature, open the **Tools > URL Editor** menu.

The URL Editor dialog displays, listing all the URLs defined for views within the data model. From here, you can edit the data model URLs individually for a particular view, or globally by using the Find & Replace button. Find & Replace is useful in a situation where the name of the service desk web server has changed.

Data Source	Text	URL
CA Service Desk \ Incidents	CA Service Desk Record	http://[WEBSERVER]/CAisd/pdmweb.exe?OP=SHOW_DETAIL+FACTORY=cr+
CA Service Desk \Problems	CA Service Desk Record	http://[WEBSERVER]/CAisd/pdmweb.exe?OP=SHOW_DETAIL+FACTORY=cr.

Schema/Owner Editor

If the database owner/schema of multiple database objects changes, you can use the Data Model Editor to update the schema/owner of those items across data sources. You can apply updates at the level of data model, data source, view, or table. To access this feature, open the Data Model Editor's **Tools > Schema/Owner Editor** menu.

The Schema/Owner Editor dialog enables you to select which objects require a schema update. Click the check box next to the required object(s), enter the new schema name, then click the **Update** button as shown below.

🚽 Schem	a/Owner Editor	×
Schema	dbo	Update
	 Data Model Data Sources CA Service Desk Ca Change Orders Ca Change Orders (Act Log) Ca CMDB Ca CMDB Ca Service Desk Admin Adventure Works 	
		Close

Copying objects

The Data Model Editor provides the capability to copy objects within or between data model files. This functionality is particularly useful when copying field definitions from one table to another, or when copying table definitions from one data model file to another. In fact, you can copy objects at any level including data sources, views, tables, and fields.

To access this feature, open the **Tools > Copy Objects** menu.

One important thing to note is that when you copy a **data source** or **view**, the included joins will be automatically copied because all required tables will be included in the copied views. When you copy a **table**, the included joins will not be automatically copied because some tables required for the joins may

not exist in the view. This means whenever you copy a single table rather than the whole view, any included joins must be copied or defined manually.

The Copy Objects dialog has two panes – a left pane for the source data model and a right pane for the destination data model – as shown in the image below.

The destination data model will always be the file currently open in the Data Model Editor. The copy source data model will default to the file currently open in the Data Model Editor. This means you can copy objects within the same data model file.

To copy from a different data model file, right-click in the Copy Source pane and select **Load External Data Model**. From the Open dialog, navigate to the data model file you want to open, and click the **Open** button.

When another file is selected for the source, it will display in the Copy Objects dialog title bar:

🔜 Copy Objects - C:\Program Files (x86)\Hagrid Software\Xtrac	tion v3\Data\Configuration\ServiceDeskDataModeLdat	×
Copy Source (External File)	Current Data Model	
Data Model Data Sources	Data Model Data Sources	-
CA Service Desk	E B CA Service Desk	

You can right-click in the Copy Source pane and select **Load External Data Model** to verify and/or change the source data model file selected.

Copy objects by dragging them from the Copy Source pane and dropping them into the desired container object in the Destination pane. For example, copy data sources to the blank area at the bottom of the Destination pane, copy views to the data sources, copy tables to the views, and copy fields to the tables.

Click the **Close** button when finished, though you'll still need to save the updated destination data model file.

Saving a data model

You can save the current data model after viewing and editing by clicking Data Model Editor's **File > Save** menu. No dialog will display, and the data model file will be saved with the same name and to the same folder location, overwriting the existing file. To save the current data model to a different filename and or location, use **File > Save as**.

Data model settings

To open the Data Model settings dialog, double-click a data model in the Data Model pane. This dialog has three tabs. The **Data Sources** tab enables you to reorder data sources via the right-click menu, as well as access the Edit dialog for the selected data source.

The **Field Groups** tab allows Xtraction to link associated fields together across multiple data sources and views. For example, consider the attribute Priority. If a Priority field is defined for both Incident and Change, specifying a field group for the Priority field allows Xtraction to dynamically filter components based on data from the Incident or Change view for the selected priority.

To add a field group, right-click in the Field Group pane and select **Add**. In the Field Group dialog, enter an **ID** and **Text** for the field group, and then right-click in the Field pane to add the fields you want grouped together.

In our example, we want to link **Incident Priority** with **Change Priority**, so we enter **Priority** in the search text box and click **Find**. We then select the check box next to CA Service Desk \ Incidents \ PRIORITY \ Priority and CA Service Desk \ Change Orders \ PRIORITY \ Priority, as shown below.

Find What	t PRI	ORITY					Find

Data model Schema View

From version 13.1 of the Data Model Editor, a data model view can be displayed as a diagram, known as the Schema View. To display the diagram for a data model view, right-click the view from the tree and select **Show Diagram**.

The diagram represents the structure of the data model, not the underlying databases. It displays all tables within the view with their primary keys highlighted (provided they follow the recommended convention

with the **PK** characters added to their text labels). Table joins are displayed as lines and arrows between tables.

To edit tables, double-click the table name to open the table editor. To edit joins, double-click a connector line to display the join editor.

Use the Zoom menu to magnify the diagram. Below the Zoom menu is a two-item tool bar that enables you to print or export the diagram to PDF. To navigate around large diagrams, use the collapsible Overview panel on the left. Click inside the panel to move the central focus of the main diagram.

Example data model

This example shows the steps involved in modelling a Sales Order from the Adventure Works database.

1. Add a data source

The first step is to add a new data source to a data model called **Adventure Works**. Be sure to provide a meaningful ID, as this is used through Xtraction to refer to the data source and should not be changed once set up.

2. Add a view

Next, add a new view called Sales Orders to the Adventure Works data source.

3. Add the Sales Order table

Add the relevant tables and fields for a sales order. Add the first table from the Adventure Works database called **SalesOrderHeader**.

🔡 Table			
ID	SALES_ORDER		
Text	en-US SALES_ORDER		
Table	SALESORDERHEADER		
Schema	SALES		
Alias	SALES_ORDER		
	✓ Active		
Fields	Joins Filters		
	Field	Active	
0	Sales Order PK		
1	Number		
2	Order Date		=
3	Ship Date	\checkmark	
4	Days To Ship		
5	Sales Person FK	\checkmark	
6	Status	\checkmark	
7	Online Order		
8	Amount Breakdown	\checkmark	
	61 T 1		
	OK	Cance	el

Some of the modelled fields are:

- **Order Date**: As sales orders are normally filtered via the order date, this field is flagged as the Default Date.
- **Days to Ship**: Different types of SQL expressions can be used for fields. **Days to ship** is a calculated field showing the number of days between the order date and the ship date.
- Sales Person FK: The ID of the sales person stored against the sales order needs to be modelled so that the relevant sales person record can be included.
- **Status**: In the SalesOrderHeader table, the Status field is a number that maps to several status values not stored in the database. So that the data presented to the end user is meaningful, a SQL expression is used:

CASE SALES_ORDER.STATUS WHEN 1 THEN 'In process' WHEN 2 THEN 'Approved' WHEN 3 THEN 'Back ordered' WHEN 4 THEN 'Rejected' WHEN 5 THEN 'Shipped' WHEN 6 THEN 'Canceled' ELSE 'Unknown' EN

• **Online Order**: So that the data presented to the end user is meaningful, this field also uses a SQL case statement:

CASE SALES ORDER.ONLINEORDERFLAG WHEN 1 THEN 'Yes' ELSE 'No' END

• Amount Breakdown: In this case, the total amount due is broken down into groups:

CASE WHEN SALES_ORDER.TOTALDUE < 500 THEN '01. < 500' WHEN SALES_ORDER.TOTALDUE < 1000 THEN '02. < 1000' WHEN SALES ORDER.TOTALDUE < 2500 THEN '03. < 2500' WHEN

```
SALES_ORDER.TOTALDUE < 5000 THEN '04. < 5000' WHEN SALES_ORDER.TOTALDUE < 10000 THEN '05. < 10000' ELSE '06. 10000+' END
```

• Sub Total: This field is flagged as Summary so that additional functions can be applied to it.

4. Add the Contact table (sales person)

Model the sales person. Within the physical database, the join flows SalesOrder > SalesPerson > Employee > Contact. This example only requires details from one modelled table, the Contact table. Because we're modelling the sales person relationship in this instance, we keep all IDs/Text relevant to the relationship.

🔛 Table			×						
ID	SALES_PERSON								
Text	en-US SALES_PERSON	en-US SALES_PERSON							
Table	CONTACT	CONTACT							
Schema	PERSON								
Alias	SALES_PERSON								
	Active								
Fields	Joins Filters								
	Field		Active						
▶ 0	Sales Person PK								
1	Sales Person								
		OK	Creat						
		OK	Cancel						

5. Join the sales order to a sales person

The final step is to add a relationship so that Xtraction knows where the sales person details come from. For this, we need to go back to the Sales Order table to add it. Because a sales person doesn't need to be associated with a sales order in the Adventure Works database, we use a left outer join for the relationship.

Join			1
Table SALES_ORDER	Join table	SALES_PERSON	~
Join type			
Left Outer			-
Join conditions			
Sales Person FK -> Sales Person PK			
		OK	Close

6. Load the data model into Xtraction and view the results

Adding MobileIron API calls to Xtraction

Xtraction 2022.1 enables you to configure, as part of the data model, API calls specifically for use with the MobileIron connector. These actions display in the Xtraction web interface and are available to execute from record lists. Upon selecting an action, an in-context message will display the results of the call (success or failure).

Use the Data Model Editor to edit your DataModel.dat file and add the API calls.

With the editor tool open:

- 1. Add the MobileIron connector to the DataModel.dat file.
- 2. Add the MobileIron URL connection details.

3. Add the API action on the desired View (in this example, it's added on Devices as shown below).

	🖳 Data Source	×
	ID MOBILE_IRON_CORE	
	Text en-US MobileIron Core	
	Version 2021.3.1	
	Database SQL Server	
	Connection Server: localhost, Database: MICoreTest, Use	ser: Xtraction ····
	External Url Url: https://micore.mobileironuk.com/api/v2/,	, UserName: xtractior ····
	Active	
	View	
External Actions		DEVICES
ID devices/retire?adminDeviceSpaceId=1	Text er	en-US Devices
Text en-US Retire	Activ	tive
	Default	t List Fields Filters Sub Query Links External Actions URL
{"deviceUuids": ["{0}"], "note": "New phone issued"} Body	Exter	ernal Action URL Active
	Retire	re 🗸
Active		
Fields		
DEVICES	▼ Add	
DEVICES Device U	UID PK	
		OK Cance

To see the results in Xtraction:

1. In the Xtraction web interface, select the **MobileIron Core > Devices** data source.

- 2. Create a dashboard with a Record List component.
- 3. Right-click a row to see the action (in this example, the action is to **Retire** the device).
