About MobileIron Sentry

The following provide information about MobileIron Sentry:

- MobileIron Sentry overview
- Benefits of Sentry
- Standalone Sentry deployment scenarios
- MobileIron Cloud, Standalone Sentry, and device interaction
- Persistent device list

MobileIron Sentry overview

MobileIron Sentry is a part of a MobileIron deployment that serves as an intelligent gatekeeper to your company’s ActiveSync server, such as a Microsoft Exchange Server, or with a backend resource such as a Sharepoint server, or it can be configured as a Kerberos Key Distribution Center Proxy (KKDCP) server. Sentry gets configuration and device information from a MobileIron unified endpoint management (UEM) platform - MobileIron Core or MobileIron Cloud.

NOTE: Access to enterprise content in business cloud services such as SalesForce, Box, G Suite, Dropbox, and Office 365 can be secured using MobileIron Access. MobileIron Access is a cloud service. A MobileIron Access deployment requires a MobileIron unified endpoint management (UEM) platform, MobileIron Standalone Sentry, and MobileIron Tunnel. For information about MobileIron Access and how to set up the service, see the MobileIron Access Guide.

The following provide additional information about MobileIron Sentry:

- MobileIron Sentry flavors
- Sentry and MobileIron UEM platform support
- ActiveSync with Standalone Sentry
- AppTunnel with Standalone Sentry
- Network traffic support with AppTunnel

MobileIron Sentry flavors

Sentry is available in two flavors: Standalone Sentry or Integrated Sentry.

Standalone Sentry is a separate appliance that acts as a gateway between devices and your ActiveSync-enabled email servers or backend resource. Standalone Sentry can be configured for ActiveSync or AppTunnel, or as Kerberos Key Distribution Center Proxy (KKDCP) server. Standalone Sentry can be installed on premise on a MobileIron Appliance or a virtual appliance. Or, Standalone Sentry can be installed in the cloud on Microsoft Azure or on Amazon Web Service (AWS).
Integrated Sentry is a Windows service that interacts with the Microsoft Exchange Server.

Sentry gets input from the MobileIron unified endpoint management (UEM) platform, MobileIron Core or MobileIron Cloud, to do the following:

- Integrated Sentry or the Standalone Sentry configured for ActiveSync protects the ActiveSync server from wrongful access from devices.
- Standalone Sentry configured for AppTunnel provides authenticated apps secure access to the backend resource.

**Sentry and MobileIron UEM platform support**

MobileIron UEM support varies depending on the type of MobileIron Sentry. The following tables provides the MobileIron UEM supported by Sentry.

**Table 1. Sentry and MobileIron UEM platform support**

<table>
<thead>
<tr>
<th>Sentry</th>
<th>UEM platform</th>

</table>
ActiveSync with Standalone Sentry

Standalone Sentry enabled for ActiveSync serves as an intelligent gatekeeper to the ActiveSync server. It uses the ActiveSync protocol to communicate with the ActiveSync server and with ActiveSync devices. For information about these interactions, see MobileIron Cloud, Standalone Sentry, and device interaction.

Exchange ActiveSync, also known as ActiveSync, is the protocol that the ActiveSync server uses to communicate over HTTP or HTTPS with devices. The ActiveSync server uses the ActiveSync protocol to do the following:

- synchronize email, contacts, calendar, tasks and notes with a mobile device
- provide for server-device interactions relating to mobile device management and policy controls

In a MobileIron deployment, these devices are called **ActiveSync devices**. Standalone Sentry and the MobileIron UEM platform work together to protect the ActiveSync server from wrongful access by these devices.

Communication between Standalone Sentry and ActiveSync servers is encrypted using HTTPS. Administrators can enable server TLS and configure outbound SSL. For Office 365 and GMail, MobileIron recommends that the communication be configured to use HTTPS, so that confidential information such as user name, password, and email content are never communicated in clear text.

AppTunnel with Standalone Sentry

Standalone Sentry enabled for AppTunnel provides per-app secure tunneling and access control to protect app data as it moves between the device and corporate backend resources (data-in-motion). App-by-app session security protects the connection between each app container and the corporate network. AppTunnel is particularly useful when an organization does not want to open up VPN access to all apps on the device. AppTunnel is part of an AppConnect app or a MobileIron Tunnel deployment. However, AppTunnel is not a requirement for an AppConnect app deployment.

Standalone Sentry and the MobileIron UEM platform work together to provide secure access to the backend resource. For example:

- MobileIron UEM provides Standalone Sentry with the backend resource configuration for the app.
- When an app attempts to connect to a backend resource, Standalone Sentry creates an app tunnel which is a unique combination of user, device, and app. Standalone Sentry provides information about the app tunnel to the UEM.
- MobileIron UEM informs Standalone Sentry when an app should not be allowed to access the backend resource. For example, Standalone Sentry blocks access to the backend resource if there are security policy violations or the AppTunnel is manually blocked.
Network traffic support with AppTunnel

<table>
<thead>
<tr>
<th>Protocol</th>

</tr>
<tr>
<td>TCP tunnels</td>
<td>TCP tunnels support HTTP and HTTPS traffic also.</td>
</tr>
<tr>
<td>IP tunneling</td>
<td>• Windows 8.1, Windows 10, iOS, and Android managed apps with MobileIron Tunnel.</td>
</tr>
<tr>
<td></td>
<td>IP tunnels also support HTTP, HTTPS, TCP, and UDP traffic.</td>
</tr>
</tbody>
</table>

Benefits of Sentry

Benefits of using Sentry in your MobileIron deployment include the following:

• Device and user authentication support with Standalone Sentry
• Enforcement of security policies with Sentry
• Visibility into which devices are accessing the backend resource with Sentry
• Ability to take action on ActiveSync device with Sentry

Device and user authentication support with Standalone Sentry

Using Standalone Sentry, you can choose how the user authenticates with the ActiveSync server or the backend resource. You can choose password authentication, certificate authentication, or Kerberos Constrained Delegation.

Enforcement of security policies with Sentry

MobileIron UEM applies security, privacy, lockdown, and sync policies to registered devices. These policies ensure that devices can connect only if they comply to your organization’s security requirements. Standalone Sentry gets device posture and compliance information from MobileIron UEM, and allows access based on the device posture.

Visibility into which devices are accessing the backend resource with Sentry

When using Standalone Sentry for ActiveSync or AppTunnel, devices access the backend resource through Standalone Sentry. Because of this single point of access, Standalone Sentry knows which devices and users are accessing backend resources.
Standalone Sentry for ActiveSync creates a unique record for each combination of user and device accessing the ActiveSync server. Standalone Sentry then associates the ActiveSync record to a device and user in MobileIron UEM. Without Sentry, a user could configure multiple devices to access the ActiveSync server, and you would have no automated way of knowing about all the devices or managing access for these devices.

Standalone Sentry for AppTunnel creates a unique AppTunnel session (connection) for each unique combination of user, app, and device. For example, Standalone Sentry creates an AppTunnel for UserA using AppA on DeviceA, and a new AppTunnel for UserA using AppB on DeviceA. Each AppTunnel provides visibility into the user, device and the backend resources being accessed.

Ability to take action on ActiveSync device with Sentry

MobileIron Cloud

If there are policy violations, registered ActiveSync devices and AppTunnels can be blocked. You can take Allow, Block, and Remove actions on unregistered ActiveSync devices.

Standalone Sentry deployment scenarios

In a MobileIron deployment, Standalone Sentry works with the MobileIron EMM platform secures access to backend resources by preventing wrongful access from devices. The EMM can be MobileIron Core on a Physical or Virtual Appliance or it can be a MobileIron Cloud deployment. This section provides various deployment scenarios with Standalone Sentry.

These deployments include:
- Deployment with Standalone Sentry in the DMZ
- Deployment with multiple Standalone Sentry servers
- Deployment with Standalone Sentry behind a proxy
- Deployment with multiple ActiveSync servers or backend resources

Deployment with Standalone Sentry in the DMZ

The following illustration shows Standalone Sentry in a configuration in which Standalone Sentry is located in the DMZ along with MobileIron EMM:
Standalone Sentry can be located in the DMZ, along with MobileIron EMM, but this configuration is not required. You can alternatively:

- Put Standalone Sentry in the DMZ and put EMM behind the corporate firewall.
- Put EMM in the DMZ and put Standalone Sentry behind the corporate firewall.
- Put both Standalone Sentry and EMM behind the corporate firewall.

### Deployment with multiple Standalone Sentry servers

Use multiple Standalone Sentries in the following situations:

- Your ActiveSync server has more users than one Standalone Sentry can support.

A Standalone Sentry has an upper limit for the number of registered ActiveSync devices that it can support, depending on its configuration. If your ActiveSync server supports more devices than this limit, use multiple Standalone Sentries. Configure each Standalone Sentry to point to the same ActiveSync server (or servers if multiple ActiveSync servers back each other up).

For more information about Standalone Sentry capacity, see the *MobileIron Standalone Sentry On-Premise Installation Guide*. 
• You have multiple ActiveSync or backend resources, each of which supports a different organization. Use one Standalone Sentry for each organization. Configure the Standalone Sentry to point to the server (or servers if multiple servers back each other up) for that organization.

• You have ActiveSync or backend resources in different locations. If you have ActiveSync or backend resources in different locations, use a Standalone Sentry for each location. By co-locating the Standalone Sentry with the ActiveSync or backend resource, you minimize latency between Sentry and the server. Configure each Sentry to point to its co-located server (or servers if multiple servers back each other up).

NOTE: Typically, you use load balancers when using multiple Standalone Sentries. For information about using load balancers with Standalone Sentry, contact MobileIron Professional Services.

For more information about deploying Standalone Sentry for high availability and load balancing, see the following knowledge base articles:
• Sentry HA Networking Overview and Recommendations at https://community.mobileiron.com/docs/DOC-1807
• Mail Server Resource Consumption at https://community.mobileiron.com/docs/DOC-2305

Deployment with Standalone Sentry behind a proxy

You can configure the Standalone Sentry to be deployed behind a proxy, for example, an Apache or an F5 server. This allows for SSL termination to occur in front of Sentry even when using certificate based authentication.

By terminating SSL in the DMZ, Standalone Sentry enables an added layer of security, as well as accommodates the DMZ firewall policies.

Leveraging this configuration requires:
• Setting up an Apache or F5 proxy to front-end the Standalone Sentry.
• Enabling this feature on Sentry via the MobileIron EMM UI.
• Additional minor changes to references to hostname in some profiles.

Contact MobileIron Professional Services or a MobileIron certified partner to set up this deployment.

Deployment with multiple ActiveSync servers or backend resources

You can configure one Standalone Sentry to work with multiple ActiveSync servers or backend resources that are backing each other up. You control when Standalone Sentry switches to another ActiveSync Server or backend resource by setting parameters involving communication failures between Standalone Sentry and the active ActiveSync servers or backend resource.

MobileIron Cloud, Standalone Sentry, and device interaction

The following describe MobileIron Core, Standalone Sentry, and device interaction:
• When an ActiveSync device accesses email
• When an app accesses the backend resource
• When MobileIron Cloud detects a security policy violation
• When Sentry initializes
• Periodic Standalone Sentry check in with MobileIron Cloud

When an ActiveSync device accesses email

The following illustrates the interaction between Standalone Sentry, UEM, and the device when the device first attempts to access the ActiveSync server.
**Figure 4. Device first attempt to access the ActiveSync server**

1. Device attempts to access the ActiveSync server.
2. Sentry queries Cloud for registered devices and unregistered tunnels that might match the device.
   - Sentry checks for unregistered tunnels to ensure that the device is not already allowed on a different Sentry registered to MobileIron Cloud.
3. Standalone Sentry correlates the list provided by Cloud and picks the best match based on the following criteria: Active Sync ID, User ID. If a match is found, Sentry does additional checks to ensure that the device is in compliance before allowing or blocking the device access to the ActiveSync server.
4. Standalone Sentry adds the device to its list of devices.
5. If access is allowed, device continues email processing.
   - If access is blocked, the device will not be able to process email through Standalone Sentry.
6. Standalone Sentry checks in with Cloud, at the next check-in interval, to update Cloud with the tunnel (activesync and app) inventory in its list.

The next time a device attempts to access the ActiveSync server, the device is already in the Standalone Sentry’s list. Standalone Sentry periodically checks in with Cloud to update the compliance status for the device. The device is either allowed or blocked access based on the compliance status.

**If Standalone Sentry cannot communicate with MobileIron Cloud**

Allowing or blocking new device access to the ActiveSync server, if MobileIron Cloud is not accessible, is configured on MobileIron Cloud.

1. Based on the setting in MobileIron Cloud, Standalone Sentry either allows or blocks access to the ActiveSync server.
2. When the connection is reestablished, Standalone Sentry evaluates the status of the device following the steps described in When an ActiveSync device accesses email.

**When an app accesses the backend resource**

When using Standalone Sentry for AppTunnel, when an app first attempts to access the backend resource, the following occurs:

1. MobileIron UEM tells Standalone Sentry whether to allow or block the app’s access to the backend resource based on:
   - the device’s security policy and traffic control rules
   - whether the app is an authorized app
2. Standalone Sentry creates an AppTunnel for the app to access the backend resource based on the AppTunnel status provided by the UEM.
3. The AppTunnel view on the UEM now includes the new AppTunnel.
4. The next time the app attempts to access the backend resource, the app uses the AppTunnel that was created to access the backend resource.

On the first attempt, if Standalone Sentry is temporarily unable to communicate with the UEM due to, for example, a network error, the following occurs:
1. Standalone Sentry allows the app to access the backend resource.
2. At the periodic Sentry check in with MobileIron Cloud, the UEM sends Standalone Sentry the proper state of the device (allowed, blocked, or wiped).

**When MobileIron Cloud detects a security policy violation**

MobileIron Cloud detects a security policy violation when, for example, a device checks in. At the periodic Cloud-Sentry check in, Standalone Sentry get the updated status for the devices and blocks the device from accessing the ActiveSync server and backend resources if MobileIron Cloud is configured so that Sentry blocks the device.

**When Sentry initializes**

When Standalone Sentry starts or restarts, the following occurs:
1. When a device attempts to access the ActiveSync server it is as though it is the first time. See When an ActiveSync device accesses email.
2. Standalone Sentry retrieves the AppTunnels equal to the Sentry device cache size (number).

**Periodic Standalone Sentry check in with MobileIron Cloud**

Standalone Sentry periodically checks in with Cloud to do the following:

- Get the updated compliance status for devices.
- Get any administrator actions taken on tunnels. Example: If a tunnel is blocked, Standalone Sentry retrieves the blocked status when it periodically checks in with Cloud.
- Update Cloud with the tunnel (ActiveSync and app) inventory in its list.

These are separate check ins with Cloud and occur on different schedules.

**Persistent device list**

Standalone Sentry operates using a list of ActiveSync devices that it keeps in its memory. This list is sometimes called the device cache. The information includes each device’s state, such as allowed or blocked.

**Checking if Standalone Sentry can reach MobileIron UEM**

You can check whether Standalone Sentry can reach MobileIron UEM by using the Standalone Sentry System Manager. See Service Diagnosis.
Standalone Sentry new features

For new features provided in previous releases, see MobileIron Sentry Product Documentation for that release.

The following are new features and enhancements available in this release and are divided into the following categories:

- Standalone Sentry features common to MobileIron UEM platforms
- Standalone Sentry features for MobileIron Core
- Standalone Sentry features for MobileIron Cloud

Standalone Sentry features common to MobileIron UEM platforms

The following new Standalone Sentry features and enhancements are available for the MobileIron UEM platforms:

- **Shorter lifespan for self-signed TLS certificates**: Beginning September 1, 2020, Apple requires that valid Transport Layer Security (TLS) certificates expire in 397 days or less. From Sentry 9.9.0 through the latest release supported by MobileIron, the lifespan of self-signed TLS certificates will be limited to fewer than 398 days.

- **Support for adding authentication to Outbound HTTP proxy**: The Outbound HTTP proxy page allows the administrator the flexibility to configure Standalone Sentry with outbound HTTP proxy server settings. The traffic from Sentry passes through the proxy to Cloud or Access. Sentry will use the User Name and Password for authentication if requested by the proxy. For more information, see "Configuring Outbound HTTP Proxy" in the MobileIron Sentry Guide.

Standalone Sentry features for MobileIron Core

There are no new Standalone Sentry features and enhancements available for MobileIron Core only.

Standalone Sentry features for MobileIron Cloud

There are no new Standalone Sentry features and enhancement available for MobileIron Cloud only.
Standalone Sentry configuration overview

Configuration overview

Accessing the Standalone Sentry System Manager

Configuration overview

You configure the initial setup of MobileIron Standalone Sentry as part of the installation process. Additional Standalone Sentry configuration for ActiveSync, AppTunnel, certificates, and preferences occurs on the MobileIron UEM. These settings specify how Sentry connects to the UEM, the ActiveSync server, backend resources, and to devices. Standalone Sentry system management occurs on the Sentry System Manager.

- Initial setup
- Standalone Sentry configurations on MobileIron Cloud
- Standalone Sentry System Manager

Initial setup

Initial setup is part of the Sentry installation process. You configure the Sentry administrator, network setup, including the Sentry IP address and FQDN, as part of the initial setup. For information see the MobileIron Standalone Sentry Installation Guide.

Before continuing with Sentry configuration using the UEM administrative portal, ensure that you have installed Standalone Sentry.

Standalone Sentry configurations on MobileIron Cloud

For Standalone Sentry configurations on MobileIron Cloud, see the following:

- Standalone Sentry for ActiveSync Email
- Standalone Sentry for AppTunnel
- Device and server authentication

Standalone Sentry System Manager

Settings in the System Manager include Standalone Sentry’s host name, network address, interfaces, and routes, the certificate for accessing the Sentry System Manager, and log management.

For more information, see:

- Standalone Sentry Settings
- Standalone Sentry Security Settings
- Standalone Sentry Maintenance Settings
Accessing the Standalone Sentry System Manager

The following provides the steps to access the Standalone System manager.

**Procedure**

1. Enter the following URL in browser:
   
   https://<fully_qualified_hostname>:8443
   
   The following screen displays.
   
   NOTE: The version number will change depending on the version of the Standalone Sentry.

   ![Standalone Sentry Sign In](image)

   **Figure 5. Standalone Sentry Sign In**

2. Enter a user ID and password for the Standalone Sentry.
   
   You can enter the administrator ID and password specified during installation of Sentry. You can also enter credentials for any local users created on this Sentry after installation. The user ID is case sensitive.
**FIGURE 6. STANDALONE SENTRY SYSTEM MANAGER**

TIP: To log out of the Sentry web portal, click **Sign Out** in the upper right corner.

Standalone Sentry System Manager
Standalone Sentry for ActiveSync Email

About Standalone Sentry for ActiveSync email

Standalone Sentry is a part of a MobileIron deployment that provides secure access to your company’s ActiveSync server, such as a Microsoft Exchange Server.

You configure Standalone Sentry for email in the MobileIron UEM platform. Configuring Standalone Sentry for email is a two-step process.

1. Configure a Standalone Sentry for ActiveSync in the MobileIron UEM platform.
2. Create an Exchange setting in the MobileIron UEM, which points to the Standalone Sentry.

   Despite its name, you configure an Exchange app setting regardless of whether your ActiveSync server is a Microsoft Exchange Server or another type of ActiveSync server, such as a Lotus Domino server.

Before you configure Standalone Sentry for ActiveSync

1. You must have installed Standalone Sentry. See the Standalone Sentry Installation Guide.
2. If your UEM is MobileIron Cloud, the Standalone Sentry must be registered to your MobileIron Cloud instance.
3. You must have the required certificate setup in your UEM.

   ActiveSync uses either pass through or Identity certificate for device authentication and pass through or Kerberos for server authentication. The Identity certificate can be local or a trusted CA. If you are using an Identity certificate, you will upload the Identity certificate in the Sentry configuration you create on your UEM.

Configuring authentication using SCEP Identity (MobileIron Cloud only)

For MobileIron Cloud only, if you intend to use a SCEP identity certificate you must add the certificate to MobileIron Cloud and create the associated App Identity Certificate configuration.

Procedure

1. Add a local or external certificate authority in Admin > Certificate Authority.
   A Connector installation is required if you are using an external certificate authority.
2. Add an App Identity Certificate Configuration. This is the SCEP identity you will use when you configure device authentication in the Standalone Sentry configuration.
3. Create an Identity Certificate setting, in Configurations > Add > Identity Certificate. For Certificate Distribution, select Dynamically Generated and for Source, select the certificate you configured in Admin
> **Certificate Authority.** You will reference the Identity Certificate configuration when you create the Exchange configuration.

# Configuring Standalone Sentry for ActiveSync

You configure a Standalone Sentry for ActiveSync by configuring the Standalone Sentry profile with an ActiveSync Service in MobileIron Cloud.

**Procedure**

1. In MobileIron Cloud, go to **Admin > Sentry**.
2. Click **+Add Sentry Profile** or click on an existing profile to **Edit**.
3. Depending on the device authentication you will configure, select one of the following:
   - **ActiveSync with basic auth**
   - **ActiveSync and/or App Tunnel with certificates**
   - **ActiveSync and/or App Tunnel with Kerberos**
4. Use the guidelines provided in the following sections to configure Standalone Sentry for ActiveSync.
   - **Configuring Standalone Sentry connectivity settings**
   - **Device Authentication**
   - **Default unmanaged devices behavior**
   - **Passive health check options**
   - **Scheduling options**
   - **Default HTTP/TCP timeouts**
   - **Sentry server configuration**
   - **ActiveSync service**
5. Click **Save**.
6. Create an Exchange setting that points to the Standalone Sentry.
   See **Configuring Exchange settings for Standalone Sentry**.

# Configuring Standalone Sentry connectivity settings

The following table describes the Standalone Sentry connectivity settings.

<table>
<thead>
<tr>
<th>Table 4. Standalone Sentry connectivity settings</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Item</strong></td>
</tr>
<tr>
<td>---------</td>
</tr>
</tbody>
</table>
| Sentry Host / IP | Enter the host name (FQDN) or IP address of the server on which the Standalone Sentry is installed.  
The host name or IP address must be external so that apps that are tunneling data are able to access the Sentry. |
| Sentry Port | Enter the port where mobile devices will connect to Standalone Sentry.  
Enter 443. |
Device Authentication

Device authentication determines how users attempting to connect to the ActiveSync server or backend resource authenticate with Standalone Sentry. AppTunnel setup requires an Identity certificate or a Kerberos setup.

See Device and server authentication for information on selecting and configuring a method of device authentication.

Default unmanaged devices behavior

By default, Sentry blocks unregistered devices from accessing backend resources. Use this setting to change Sentry’s behavior to allow unregistered devices access to backend resources. Irrespective of this setting, you will be able to allow or block devices on a per-device basis.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow unmanaged devices to receive email and data</td>
<td>Check to allow unregistered devices access to backend resources.</td>
</tr>
</tbody>
</table>

Passive health check options

These settings determine when a Sentry is marked as ‘dead’. If a server fails more than the number set in Dead Threshold within the time set in Failure Window, then it is marked as dead for the time set in Dead Time.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dead Threshold</td>
<td>Specify the number of times that a server connection can fail before the server will be marked “dead”. The valid range is 1 through 1000.</td>
</tr>
<tr>
<td>Failure Window</td>
<td>Specify the time interval in milliseconds during which the specified number of server connection failures must occur in order for the server to be marked “dead”. The valid range is 1 though 86400000 milliseconds (24 hours).</td>
</tr>
<tr>
<td>Dead Time</td>
<td>Specify the amount of time in milliseconds that the server should be marked “dead” after the specified number of connection failures. The valid range is 1 through 172800000 milliseconds (48 hours).</td>
</tr>
</tbody>
</table>

Scheduling options

The options provide additional flexibility in managing multiple Sentrys. Specify Priority or Round Robin scheduling if multiple servers are specified.
### Table 7. Scheduling options field description

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority</td>
<td>The first available server in the specified list will be used, with the first server in the list having highest priority. So if the first server in the list is never unavailable, then the other servers will never be used.</td>
</tr>
<tr>
<td>Round Robin</td>
<td>Each server in the list will be used in turn. By default, Round Robin is enabled.</td>
</tr>
</tbody>
</table>

**Default HTTP/TCP timeouts**

These settings provide additional flexibility to configure Standalone Sentry session timeouts. You may want to configure the session timeouts to manage server resources.

**WARNING:** Do not make changes to the settings unless specifically instructed in the documentation or by MobileIron Professional Services.

### Table 8. Default HTTP/TCP timeouts field description

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Socket read/write timeout</td>
<td>Specify the time in milliseconds, the Sentry should check for the socket read/write time out from either the device or the server. Enter a valid integer. The default setting is 10000, and the minimum is 1.</td>
</tr>
<tr>
<td>Server connection timeout</td>
<td>Specify the time in milliseconds after which the Sentry will time out when connecting to the server. Enter a valid integer. The default setting is 10000, and the minimum is 1.</td>
</tr>
<tr>
<td>Server response timeout</td>
<td>Specify the time in milliseconds after which the Sentry will time out when waiting for an HTTP response from the server. Enter a valid integer. The default setting is 60000, and the minimum is 1.</td>
</tr>
<tr>
<td>Device request timeout</td>
<td>Specify the time in milliseconds after which the Sentry will time out when waiting for an HTTP request from the device on a new or existing connection. Enter a valid integer. The default setting is 10000, and the minimum is 1.</td>
</tr>
</tbody>
</table>

**Sentry server configuration**

Configure the Sentry port, certificate, protocols and cipher suites.

- HTTPS Port
• Certificate/Key
• Protocols and cipher suites
• Load balancers and ciphers
• Supported protocols

HTTPS Port

The default is 443. This is the port Sentry listens on for connections from the mobile devices.

Certificate/Key

When you first install Standalone Sentry, a self-signed certificate is also installed. MobileIron strongly recommends that you replace the default certificate with a publicly trusted certificate.

Protocols and cipher suites

Standalone Sentry uses the ciphers and protocols defined here for incoming traffic from device to Standalone Sentry and outgoing traffic from Standalone Sentry to backend resources. Ciphers and protocols for incoming traffic is set in the Incoming tab. Ciphers and protocols for outgoing traffic is set in the Outgoing tab.

You can do the following:
• View the available and selected protocols and cipher suites.
• Setup custom protocol and cipher suite configuration.
• Enable SNI. (Outgoing only)

A default set of cipher suites and protocols are selected. You can customize the selected list of ciphers and protocols to match the security and system needs for your enterprise.

The available and default set of cipher suites and protocols may be updated in a release. Some cipher suites and protocols may be added, while others may be removed. Cipher suites and protocols may be removed if the platform no longer supports these cipher suites and protocols.

If you are set up to use the default cipher suites and protocols, these will be updated to the latest defaults. If you are set up to use a custom list of selected cipher suites and protocols, the custom list is preserved. However, any cipher suites or protocols that are not supported by Standalone Sentry are ignored and noted in Monitoring in Standalone Sentry System Manager.

WARNING: Making changes to the default list of cipher suites may impact the performance and security of traffic through Standalone Sentry. Therefore, before making any changes to the selected cipher suites, MobileIron recommends that you understand both the performance and security impact of the changes.

Load balancers and ciphers

If you use a load balancer to perform HTTPS/GET checks against your Sentry and your Sentry uses strong ciphers, do the following:
• Make sure the ciphers enabled in your HTTPS/GET check match one of Sentry’s strong ciphers.
• If you cannot change the ciphers that your HTTPS/GET check uses, you can change your check to use HTTP/GET to accomplish the same monitoring.

**Supported protocols**

- TLSv1
- TLSv1.2
- TLSv1.1
- SSLv2Hello

Note The Following:
- SSLv2Hello is a pseudo-protocol that allows Java to initiate the handshake with an SSLv2 'hello message.' This does not cause the use of the SSLv2 protocol, which is not supported by Java. SSLv2Hello requires that TLSv1 protocol is also selected.
  SSLv2Hello is required by some load balancers and SSL off loaders for proper functioning. If your environment does not need it, it is recommended to remove this from the protocol list for improved security.

**SNI**

Server Name Indication (SNI) is an extension to TLS. SNI allows multiple hostnames to be served over HTTPS from one IP address. By default, SNI is disabled on Standalone Sentry for outgoing connections.

SNI allows a load balancer to direct incoming traffic to the correct backend server based on the hostname provided by the client, in this case, Standalone Sentry. Some backend server may require that SNI is enabled in the client.

Your Active Directory Federation Services (ADFS) may require SNI for all client communications.

**NOTE:** If SNI is enabled for Outgoing SSL connections, in some cases health check may fail if the backend server does not also support SNI. The workaround is to disable health check for the impacted server.

**Advanced Traffic Control and server-side explicit proxy**

These settings are not applicable for configuring an ActiveSync service on Standalone Sentry.

**ActiveSync service**

In the Sentry profile, in **Manage Services**, configure **Exchange ActiveSync** to set up an ActiveSync service.

The following table describes the settings for configuring an ActiveSync service.
# Table 9: Field Descriptions for ActiveSync Service

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| Service Name                  | The **Service Name** identifies the ActiveSync service.  
A service name cannot contain these characters: `space` \ ; * ? < > " | |
| Limit Protocol Version        | Choose the ActiveSync protocol version that the device and the ActiveSync server use to communicate with Standalone Sentry.  
If the device is already registered, you have to push the Exchange profile to the device to force the device to use the new protocol. Alternately, device users can go to iOS device **Settings > Mail > Accounts**, select the enterprise mail account, and toggle to disable and re-enable the mail account. |
| Server Authentication         | Select how the Standalone Sentry authenticates the user to the ActiveSync server.  
Select Pass Through or Kerberos.  
The Kerberos option is only available if you selected **ActiveSync and/or App Tunnel with Kerberos**.  
If you select Kerberos, additional fields are displayed. See [Authentication using an Identity certificate and Kerberos constrained delegation](#). |
| ActiveSync Servers            | Enter the ActiveSync server FQDN and port.  
You can add multiple ActiveSync servers.  
For Microsoft Office 365, enter outlook.office365.com.  
For Gmail, enter m.google.com. |
| Enable Server TLS             | Specify whether the ActiveSync servers require SSL (i.e., port 443).  
**NOTE:** If you are using Google Apps via Standalone Sentry, you must check Enable Server TLS. |
| Enable Redirect Processing (451) | To disable redirect processing, clear the check box.  
If Enable Redirect Processing (451) is disabled, the Standalone Sentry does not handle redirection, and passes the redirect URL to the device.  
See also [451 redirect processing](#). |
| Enable Active Health Check    | The default setting is enabled.  
Clear the check box to disable the ActiveSync server health check.  
If enabled, when the ActiveSync server fails for the number of times configured in the Dead Threshold setting and within the number configured in the Failure Window, then the ActiveSync server status shows Unreachable.  
When the background health check determines that the server is live for the number configured for Live Threshold, the ActiveSync server status shows Reachable. |
Configuring Exchange settings for Standalone Sentry

The Exchange setting is pushed to the device and points to the Standalone Sentry.

**Procedure**

1. In the MobileIron Cloud, go to **Configurations**.
2. Click **+Add > Exchange**.
3. For **Server address**, enter one of the following:
   - When using Standalone Sentry, set the server address to the Standalone Sentry’s address.
   - When using Standalone Sentry with Lotus Domino server 8.5.3.1 Upgrade Pack 1, set the server address to `<Standalone Sentry’s fully qualified domain name>/traveler`.
   - When using Standalone Sentry with a Lotus Domino server earlier than 8.5.3.1 Upgrade Pack 1, set the server address to `<Standalone Sentry’s fully qualified domain name>/servlet/traveler`.
   - If you are using load balancers, contact MobileIron Professional Services.
4. Enter the variable for the ActiveSync User.
5. Enter the variable for the ActiveSync user Email.
6. Enter the ActiveSync user Account Password.
7. If Standalone Sentry is using Identity or Group certificate for device authentication, select the **Identity Certificate** configuration to generate the identity certificate for the device.
8. After completing the form, click **Next**.
9. Select the distribution option and click **Done**.

**Related topics**

See “Exchange Configuration” in the *MobileIron Cloud Guide* or help to complete the fields in the form.

**451 redirect processing**

If 451 redirect URL is set up on your ActiveSync server, Standalone Sentry handles the redirection when a device tries to sync. The redirect URL is not forwarded to the device.

You configure 451 redirect processing on the Standalone Sentry by enabling or disabling the **Enable Redirect Processing (451)** field in the **ActiveSync service**. Redirect processing is enabled by default.

**Standalone Sentry Email+ Notification Service for MobileIron Cloud**

You must configure Standalone Sentry on MobileIron Cloud and key-value pairs of the Email+ application to receive email notifications on the device. The configuration is required for Standalone Sentry to act as an Email+ Notification Service to deliver notifications. This feature is available only when it is used with Email+ 3.13.0.
Before you begin

- Ensure that you have MobileIron Cloud 69 and MobileIron Sentry 9.8.5.
- Ensure that you have the JWT token of CNS production server. A token is a randomly generated string from MobileIron, representing an authorization token for the cloud server. The term JWT token is also referred as Authorization Token, Token, and notification_server_authorization across MobileIron products.
- Standalone Sentry must be configured with a publicly trusted certificate.
- Ensure that the Exchange servers are configured with the service account. The servers must have identity certificate to authenticate the service account. For more information on configuring service account on Microsoft Exchange server, see Configuring a service account. Also, see Microsoft documentation.
- If Exchange server version support is earlier than TLS v1.2, then the supported protocols should be configured in **Incoming SSL configuration protocols** on MICS.

Procedure

1. On MobileIron Cloud, click **Admin**
2. Under **Infrastructure**, click **Sentry** < Add Sentry Profile >
3. Select **Email+ Notification Service** and click **Next**.

   ![Add Profile](image)

   **Choose Authentication**

   The type of authentication will determine how you can use the Sentry servers that are assigned to this profile.

   - **ActiveSync with basic auth**
     - Use this option to configure ActiveSync where the user authenticates with their corporate username and password.
   - **ActiveSync and/or App Tunnel with certificates**
     - Use this option to configure ActiveSync and/or App Tunnel using X.509 certificates for authentication.
   - **ActiveSync and/or App Tunnel with Kerberos**
     - Use this option to configure ActiveSync and/or App Tunnel using Kerberos for authentication.
   - **Email+ Notification Service**
     - Use this option to configure Sentry for VIP email notifications in Email+.

   **Note:** If you plan to use Certificates or Kerberos, you must first add a **Certificate Authority** and an **Identity Certificate Configuration** (see below) before you create a Sentry Profile.

   1. Go to the **Add Configuration** section to add a new configuration.
   2. Select **🔗** to add your new App Identity Certificate Configuration.
   3. Under the **Certificate Distribution** dropdown, select “Dynamically Generated”
   4. Once created, your new configuration will appear under the Configurations list like this.

4. In **Global Settings**, enter a profile **Name** and **Notification Server Hostname** (Sentry hostname). The port is set at 443.
5. **Verify the Sentry Server Configuration and click Next.**

**NOTE:** These fields are at default values. Ensure that the TLS certificate is a third party trusted certificate.
6. Under **Services > Manage Services**, click **Email+ Notification Service**.
7. Enter the following details:

- **Notification Server Authorization**: The token received after registering for the Cloud Notification Service.
- **Add the Service Account**: Click Add to upload the Exchange Service account certificate.
- **Add the Exchange Server**: Click Add to add the desired Exchange Server. The port is set at 443.
- Retain the other fields at default values.

8. On Standalone Sentry, register Sentry to MobileIron Cloud using CLI. 
   "registration tenantadminuser".
9. Under **Sentry > Sentry Profiles**, click **Actions** to assign the registered Sentry to the ENS profile created above.

10. On MobileIron Cloud, click **Apps > App Catalog > Add** to add the Email+ configuration. Select the appropriate configuration for the Email+ application and under **Apps Configurations**, enter the following details.

11. Click **Done**.
Next steps

You must configure the key-value pairs for Email+ notification services. For more information, see “Additional configurations using key-value pairs” in the MobileIron Email+ Guide.

Configuring a service account

Service account on Microsoft Exchange impersonates other mailboxes when accessing exchange over various supported protocols. Following are the main steps for configuring service account.

- Setting up service accounts on Exchange server
- Configuring a service account on Exchange server

Setting up service accounts on Exchange server

For the purpose of Exchange Notification Proxy (ENP), Microsoft’s Exchange Web Services (EWS) protocol is used to access mailbox messages. For example service account is assigned to the following role:

**ApplicationImpersonation**

The EWS sends requests with the credentials of a single service account which includes an .XML key.

```xml
<soap:Header>
  <t:RequestServerVersion Version="Exchange2013" />
  <!-- The following causes the request to run as alfred@contoso.com -->
  <t:ExchangeImpersonation>
    <t:ConnectingSID>
      <t:SmtpAddress>alfred@contoso.com</t:SmtpAddress>
    </t:ConnectingSID>
  </t:ExchangeImpersonation>
</soap:Header>
```

This allows a single account to access the mailbox of other accounts.

Configuring a service account on Microsoft Exchange server

**Procedure**

1. In the Microsoft Exchange Management console, open a browser and type in URL. For example: https://<hostname>/ecp
2. Log in as an Admin, go to Mail > Options > Manage My Organization > Roles & Auditing > Mailboxes and create a new Role group.
3. Add the **applicationImpersonation** role to the group.
4. Add members to the group.
5. Click **Save** to finish.

For more information on configuring service account on Microsoft Exchange server, see [Microsoft documentation](#). A device authenticating to Core with a certificate is also known as certificate-based authentication (CBA) to Core.
Standalone Sentry for AppTunnel

About Standalone Sentry for AppTunnel

Standalone Sentry configured for AppTunnel provides users secure access from an app on their device to your company’s backend resource such as a SharePoint server. AppTunnel protects app data-in-motion by providing app-by-app session security between an app and the corporate resource.

You configure Standalone Sentry for AppTunnel in the MobileIron UEM. AppTunnel is part of a MobileIron Tunnel deployment or an AppConnect app deployment.

Deploying AppTunnel is a two-step process:
1. In the MobileIron UEM configure a Standalone Sentry for AppTunnel.
2. Configure one of the following for apps:
   - Configure an AppConnect app.
   Or
   - Configure MobileIron Tunnel.

Before you configure Standalone Sentry for AppTunnel

1. You must have installed Standalone Sentry. See the Standalone Sentry Installation Guide.
2. If your UEM is MobileIron Cloud, the Standalone Sentry must be registered to your MobileIron Cloud instance.
3. You must have the required certificate setup in your UEM.
   AppTunnel uses either an Identity certificate for device authentication and pass through or Kerberos for server authentication. The Identity certificate can be local or a trusted CA. If you are using an Identity certificate, you will upload the identity certificate in the Sentry configuration you create on your UEM. See Configuring authentication using SCEP Identity (MobileIron Cloud only).

Related topics
- About Standalone Sentry for AppTunnel
- Configuring Standalone Sentry for AppTunnel
Configuring authentication using SCEP Identity (MobileIron Cloud only)

For MobileIron Cloud only, if you intend to use a SCEP identity certificate you must add the Certificate to MobileIron Cloud and create the associated App Identity Certificate configuration.

**Procedure**

1. **Add a local or external certificate authority in Admin > Certificate Authority.**
   A Connector installation is required if you are using an external certificate authority.
2. **Add an App Identity Certificate Configuration.** For source, select the certificate you configured in Admin > Certificate Authority. This is the SCEP identity you will use when you configure device authentication in the Standalone Sentry configuration.
3. **Create an Identity Certificate setting, in Configurations > Add > Identity Certificate.** For Certificate Distribution, select Dynamically Generated and for Source, select the certificate you configured in Admin > Certificate Authority. If the app configuration requires, you will reference the Identity Certificate configuration in the app’s configuration that uses an AppTunnel service or the Tunnel service.

Configuring Standalone Sentry for AppTunnel

**NOTE:** If you configure AppTunnel on a Standalone Sentry that was already configured for ActiveSync, and you change the device authentication options, ensure that the associated Exchange profile matches the device authentication options.

**Procedure**

1. In MobileIron Cloud, go to Admin > Sentry.
2. Click +Add Sentry Profile or click on an existing profile to Edit.
3. Depending on the device authentication you will configure, select one of the following:
   - ActiveSync and/or App Tunnel with certificates
   - ActiveSync and/or App Tunnel with Kerberos
4. Use the guidelines provided in the following sections to configure Standalone Sentry for AppTunnel.
   - Standalone Sentry connectivity global settings
   - Device Authentication
   - Default unmanaged devices behavior
   - Passive health check options
   - Scheduling options
   - Default HTTP/TCP timeouts
   - Sentry server configuration
   - Advanced Traffic Control and server-side explicit proxy
   - AppTunnel service
5. Click Save.
6. Assign the profile to a registered Standalone Sentry. Only one profile can be assigned to a Standalone Sentry.

**Standalone Sentry connectivity global settings**

See Configuring Standalone Sentry connectivity settings.

**Device Authentication**

Device authentication determines how users attempting to connect to the ActiveSync server or backend resource authenticate with Standalone Sentry. AppTunnel setup requires an Identity certificate or a Kerberos setup.

See Device and server authentication for information on selecting and configuring a method of device authentication.

**Default unmanaged devices behavior**

By default, Sentry blocks unregistered devices from accessing backend resources.

See Default unmanaged devices behavior.

**Passive health check options**

These settings determine when a server is marked as ‘dead’.

See Passive health check options.

**Scheduling options**

The options provide additional flexibility in managing multiple Sentries.

See Scheduling options.

**Default HTTP/TCP timeouts**

**WARNING:** Do not make changes to the settings unless specifically instructed in the documentation or by MobileIron Professional Services.

See Default HTTP/TCP timeouts.

**Sentry server configuration**

Configure the Sentry port, certificate, protocols and cipher suites.

See Sentry server configuration.
Advanced Traffic Control and server-side explicit proxy

- Advanced traffic control
- Server-side explicit proxy

Advanced traffic control

Advance Traffic Control (ATC) allows you to manage access to backend resources based on which app the traffic is coming from and the destination IP address or domain name. ATC provides administrators additional control and flexibility in how traffic to backend resources are managed. You can specify whether traffic to the backend resource is through a proxy server, allowed direct access, or blocked.

Example: You may want to direct Safari traffic to go through a certain proxy server and all other traffic to go directly to backend resources. In this case, you would configure the Safari bundle ID in the Application BundleID and select the proxy server to direct Safari traffic, and set the Default Action to Allow.

NOTE: If you are using a Standalone Sentry version 8.5.0 or earlier and configure ATC rules, Standalone Sentry will ignore the ATC rules.

</tbody>
</table>

Server-side explicit proxy

Standalone Sentry supports sending traffic through an HTTP proxy server to access corporate resources. The proxy server is located behind the firewall and sits between the Sentry and corporate resources. This deployment allows you to access corporate resources without having to open the ports that Sentry would otherwise require.

Consider the following:

- This configuration is only supported for AppTunnel traffic.
- Proxy is configured for each AppTunnel service. You may configure proxy for some AppTunnel services and not for other AppTunnel services on the same Sentry.
- The same proxy server may be configured on multiple Sentries.
Standalone Sentry filters HTTP traffic through a TCP tunnel that uses server-side explicit proxy. For HTTP traffic through a TCP tunnel, if server-side explicit proxy is configured, Standalone Sentry will treat the explicit proxy as HTTP proxy. The HTTP request URL will be modified to include the target host.

In all other cases, Standalone Sentry treats the explicit proxy server as a TCP proxy server. Sentry will send a HTTP CONNECT request to the explicit proxy, followed by TCP data.

</tr>
</tbody>
</table>

**Traffic control rules**

Specify whether traffic from an app to the backend resource is through a proxy server, allowed direct access, or blocked. You can create multiple rule sets. Each rule set can have multiple rules. However, all rules in a rule set can only be one type, either IP based or domain based. You cannot create a mix of IP based and domain based rules in a rule set.

**Note**

- Rules in a rule set are matched based on the order in which they are listed. This is especially important for domain names with wildcards. For example, if the Block action is selected for *.company.com, and the Proxy action is selected for *.internal.company.com, and the rule for *.company.com is listed first, then all company.com domains will be blocked. Use the up and down arrows to order the rules.
- If AppTunnel traffic is blocked due to traffic control rules, the AppTunnel entry is not reported in the Sentry tab in device details for a device.

**Rule type**

Select one of the following:

- **IP based**: The rule is matched based on the IP address of the destination host. IP based rules are supported only for IP traffic from Windows and Android devices going through MobileIron Tunnel. The destination has to be an IP address or an IP range.
  
  Example: 10.0.0.0/8, 10.5.0.0/16, 10.5.2.0/24, 10.5.5.2/32

| Custom TCP             | • TCP                                                      |

### Field description for App Tunnel service

The following table describes the fields available for configuring an App Tunnel service. The fields available for configuration changes depending on the type of service you are configuring.

### Table 13. Field Descriptions for App Tunnel Service

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| Service Name          | The **Service Name** identifies the App Tunnel service. The service name is referenced in the App Connect app configuration for configuring tunneling for the App Connect app. The app is restricted to accessing the backend resources listed in the **Server List** field.  
A service name cannot contain these characters: 'space' \ ; * ? < > " |. |
| Service Type (only MobileIron Tunnel) | IP: Select to configure packet-tunnel provider type VPN. TCP: Select to configure app-proxy VPN.                                    |
| Enable DFS            | Select the check box if you are configuring a DFS site in Docs@Work. Only for Docs@Work for CIFS service.                                    |
| Server Authentication | Select the authentication scheme for the Standalone Sentry to use to authenticate                                                        |
the user to the backend resource:

- **Pass through (Basic Authentication)**
  
  The Sentry passes through the authentication credentials, such as the user ID and password (basic authentication) or NTLM, to the backend resource.

  NOTE: For TCP and IP tunneling, select Pass Through. The Sentry passes through all TCP or IP packets to the backend resource.

- **Kerberos**

  The Sentry uses Kerberos Constrained Delegation (KCD). KCD supports Single Sign On (SSO). SSO means that the device user does not have to enter any credentials when the AppConnect app accesses the backend resource.

  The **Kerberos** option is only available if:
  
  - You selected **ActiveSync and/or App Tunnel with Kerberos**.
  - Kerberos authentication is now supported with Exchange ActiveSync, Web@Work, SharePoint for Docs@Work, and CIFS for Docs@Work services.

  If you select Kerberos, additional fields are displayed. See Authentication using an Identity certificate and Kerberos constrained delegation.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All destinations (forward proxy)</td>
<td>Select if you want all traffic from the app to go through Standalone Sentry.</td>
</tr>
<tr>
<td>Specific destinations (reverse proxy)</td>
<td>Select if you want to restrict traffic to only specific servers. Standalone Sentry sends through only requests to the configured servers.</td>
</tr>
<tr>
<td>Servers (reverse proxy)</td>
<td>Add the backend resource’s fully qualified domain name (FQDN) and port number on the backend resource that the Sentry can access. Example:sharepoint1.companyname.com:443 Acceptable characters in a host name are letters, digits, and a hyphen. The name must begin with a letter or digit. You can enter multiple resources. The Sentry uses a round-robin distribution to load balance. That is, it sets up the first tunnel with the first resource, the next with the next resource, and so on.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>ATC Rule Set</td>
<td>Select the ATC rule set if you want to manage the AppTunnel service traffic through ATC rules.</td>
</tr>
<tr>
<td></td>
<td>You must also have configured Advanced Traffic Control (ATC) rules. Only the rule type supported by the app will be listed.</td>
</tr>
<tr>
<td>Add Context Headers</td>
<td>Select the check box to forward additional device context information to your corporate backend resource.</td>
</tr>
<tr>
<td></td>
<td>This allows your corporate backend resources to further validate the device.</td>
</tr>
<tr>
<td></td>
<td>NOTE: Context headers are not supported for TCP tunneling.</td>
</tr>
</tbody>
</table>

**About context headers**

As an administrator you may require your corporate backend resources to further validate the devices accessing these resources. In these cases, Standalone Sentry forwards context information in the header. You enable context headers in a service configuration. So, you can decide to enable context headers for some services and not enable context headers for other services.

NOTE: If server-side explicit proxy is configured, the request to the proxy (HTTP CONNECT) includes the context headers.

**Table 14. Information in Context Headers**

Device and server authentication

Overview
Configuring device and server authentication
Cross-realm Kerberos support
Configuring Kerberos authentication for DFS

Overview

Standalone Sentry supports device authentication using user name and password, certificate-based authentication, or Kerberos Constrained Delegation. Device authentication involves configuring:
- device authentication (how the device authenticates to the Standalone Sentry)
- server authentication (how the Standalone Sentry authenticates the device to the server).

Device authentication

Device authentication specifies how the device authenticates to the Standalone Sentry. The following table describes the devices authentication methods supported by Standalone Sentry.

<table>
<thead>
<tr>
<th>Device Authentication</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass Through</td>
<td>Only available if you are using the Sentry for ActiveSync only. The Sentry passes through the authentication provided by the device, for example, user name and password, NTLM.</td>
</tr>
</tbody>
</table>
| Group Certificate     | Available for ActiveSync and AppTunnel. Requires the following:  
  - A trusted group certificate for device authentication.  
  - A authentication method like user name and password or NTLM for authenticating the device to the server.  

  NOTE: KCD is not supported with Group Certificates. |
| Identity Certificate  | Available for ActiveSync and AppTunnel. Requires the following:  
  - A certificate issued by a Trusted Root Authority for device authentication  
  - A user name and password or a properly configured Kerberos implementation for authenticating the device to the server. |
Server authentication

Server authentication specifies how the Sentry authenticates the device to the backend resource. This can be the ActiveSync server or a backend resource. The following table describes the supported server authentication. These are supported for both ActiveSync and AppTunnel.

<table>
<thead>
<tr>
<th>Server Authentication</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass Through</td>
<td>The Sentry passes through the authentication provided by the device. For example: user name and password, NTLM. NOTE: This is the only authentication option you can use with Microsoft Office 365. This is also the only authentication option available for TCP and IP tunneling.</td>
</tr>
<tr>
<td>Kerberos</td>
<td>Only available if you choose Identity Certificate for device authentication. Requires a properly configured Kerberos implementation.</td>
</tr>
</tbody>
</table>

Configuring device and server authentication

You specify the device and server authentication in the Sentry configuration when you create a Sentry profile in Admin > Sentry. Click Add Sentry Profile or edit an existing Sentry profile.

Select one of the following:

- **ActiveSync with basic auth**: Only for Sentry for ActiveSync. Sentry passes through the user name and password provided by the device user.
- **ActiveSync and/or AppTunnel with certificates**: Select if you plan to use identity certificates (X.509) for device authentication. Pass through is the only option available for server authentication
- **ActiveSync and/or App Tunnel with Kerberos**: Select if you plan to use Kerberos to authenticate the device to the server.

If you do device authentication with identity certificates, you can specify different server authentication types for the ActiveSync configuration and for each AppTunnel service. For example, you can specify Pass Through for the ActiveSync server and Kerberos Constrained Delegation (KCD) for the servers listed for an AppTunnel service.

**Procedure**

1. Obtain the certificates required for your implementation.
2. In Admin > Sentry, click Add Sentry Profile or edit an existing Sentry profile.
3. For Authentication select one of the following authentication options, depending on your implementation:
   - **ActiveSync with basic auth**
     See ActiveSync with basic auth and pass through for next steps.
   - **ActiveSync and/or AppTunnel with group certificates**
     See Authentication using a group certificate and pass through for next steps.
ActiveSync with basic auth and pass through

If you select **ActiveSync with basic auth** for authentication, then Standalone Sentry passes through the user name and password provided by the device user. No additional configuration on MobileIron Cloud is required.

Authentication using a group certificate and pass through

If you select **ActiveSync and/or AppTunnel with certificates**, additional configuration fields display for Authentication.

For device authentication with group certificate, **Pass Through** is the only option available for server authentication.

To complete the configuration:

1. In the Standalone Sentry profile with **ActiveSync and/or AppTunnel with certificates**, in Global Settings, for **Device Authentication Mode**, select **Use a single certificate for 2-factor auth (basic + cert)**.
2. Click **Upload Certificate**.
   Additional fields are displayed.
3. Enter the **Certificate name** and **Password** for the certificate.
4. Upload the certificate (usually a .cer or PKCS 12 file) you trust.
5. Click **Save**.

**NOTE:** Though certificate is uploaded, it does not persist until you click **Save**.

6. If you want to validate the certificates presented by the device against the Certificate Revocation List (CRL) published by the CA, then select **Check Certificate Revocation List (CRL)**.

**NOTE:**

- CRL check should be enabled only if the certificate chain presented by the device or the Trusted-Front-End to Standalone Sentry contains information to download CRL over HTTP.
- Only HTTP- and HTTPS-based CRLs are supported. Some CAs create LDAP-based CRLs by default that will not work with Sentry.
- For CRL validation to work, Sentry requires network connectivity to the CRL Distribution Point (CDP), usually the CA that issued the certificate, through an HTTP or HTTPS port.

7. **Server Authentication** defaults to **Pass Through** in any service, ActiveSync or AppTunnel, that you configure.
8. Click **Save**.
   The Sentry restarts.

Authentication using a SCEP Identity certificate and pass through

If you select **ActiveSync and/or AppTunnel with certificates**, additional configuration fields display for Authentication. This section describes the configuration when you choose **Use SCEP Identity** to authenticate
the device to the Sentry and Sentry uses **Pass Through** for authenticating the device to the ActiveSync server or a backend resource.

**Before you begin**

You must have completed the steps described in Configuring authentication using SCEP Identity (MobileIron Cloud only).

**Procedure**

1. In the Standalone Sentry profile with **ActiveSync and/or AppTunnel with certificates**, in **Global Settings**, for **Device Authentication Mode**, select **SCEP Identity**.
2. Select the **App Identity Certificate Configuration** for the Identity certificate you want devices to use to authenticate with Sentry.
3. If you want to validate the certificates presented by the device against the Certificate Revocation List (CRL) published by the CA, then select **Check Certificate Revocation List (CRL)**.

**NOTE:**

- CRL check should be enabled only if the certificate chain presented by the device or the Trusted-Front-End to Standalone Sentry contains information to download CRL over HTTP.
- Only HTTP- and HTTPS-based CRLs are supported. Some CAs create LDAP-based CRLs by default that will not work with Sentry.
- For CRL validation to work, Sentry requires network connectivity to the CRL Distribution Point (CDP), usually the CA that issued the certificate, through an HTTP or HTTPS port.
4. **Server Authentication** defaults to **Pass Through** in any service, ActiveSync or AppTunnel, that you configure.
5. Click **Save**.
   The Sentry restarts.

**Authentication using an Identity certificate and Kerberos constrained delegation**

This section describes the configuration when you choose **Identity Certificate** to authenticate the device to the Sentry and **Kerberos** for how Sentry authenticates the device to the ActiveSync server or backend resource.

**Note The Following:**

- For ActiveSync, Sentry supports Kerberos authentication only with Microsoft Exchange Servers.
- If you are configuring tunneling to a DFS server, in the Kerberos distribution center, map the SPN of the CIFS service domain to one of its domain controllers. See Configuring Kerberos authentication for DFS.
- Kerberos initialization in Standalone Sentry occurs only during tomcat start up. Standalone Sentry obtains the ticket-granting ticket (TGT) during Kerberos initialization. If the initialization fails during tomcat start up, Standalone Sentry automatically continues to retry until a service ticket from the KDC is received. The retry interval starts at one minute and maxes out at one-hour intervals. Failed initialization attempts are reported with a WARN level log in Standalone Sentry System Manager in Monitoring. To manually initialize Kerberos, use the debug command, debug sentry kerberos init. The command has no impact if Kerberos initialization has already been completed.
Before you begin

You must have set up your Kerberos environment. See Authentication Using Kerberos Constrained Delegation on the MobileIron Support site.

NOTE: The Authentication Using Kerberos Constrained Delegation document has setup instruction on MobileIron Core also. Please ignore the setup instruction for MobileIron Core.

Procedure
1. In the Standalone Sentry profile with ActiveSync and/or AppTunnel with Kerberos, in Global Settings, for Device Authentication Mode, select Use SCEP Identity.
2. Select the App Identity Certificate Configuration for the Identity certificate you want devices to use to authenticate with Sentry.
3. If you want to validate the certificates presented by the device against the Certificate Revocation List (CRL) published by the CA, then select Check Certificate Revocation List (CRL).

NOTE:
- CRL check should be enabled only if the certificate chain presented by the device or the Trusted-Front-End to Standalone Sentry contains information to download CRL over HTTP.
- Only HTTP- and HTTPS-based CRLs are supported. Some CAs create LDAP-based CRLs by default that will not work with Sentry.
- For CRL validation to work, Sentry requires network connectivity to the CRL Distribution Point (CDP), usually the CA that issued the certificate, through an HTTP or HTTPS port.
4. In the Kerberos section, add Realm and Key Distribution Center (KDC).
   - **Realm:** The Kerberos administrative domain with CIFS shares. The realm is usually the company domain name, in all uppercase characters.
   - **Key Distribution Center:** The Key Distribution Center is the network service that supplies session tickets and temporary session keys. This is generally the Active Directory domain controller host name.
5. Click Next to enter or update Sentry Server Configuration information.
6. Click Next to add or edit a service and configure server authentication.
7. For **Server Authentication** for a service, ActiveSync or AppTunnel that you configure, select **Kerberos**.
   When you select Kerberos for **Server Authentication**, Specific destinations (reverse proxy) is selected by default. The Derive Service Principal Name (SPN) from fully qualified Server Name option appears.
   If you select All Destinations (forward proxy), the Certificate Field Mapping section also appears. Click + Add to add an entry for certificate mapping.
<table>

<tr>
<td></td>
<td>a. Select the field from which Standalone Sentry will derive the User UPN or User DN.</td>
</tr>
<tr>
<td></td>
<td>NOTE: For WP8.1 devices, for User UPN, select either DNS Name or RFC 822 Name, and for User DN select Certificate Subject.</td>
</tr>
<tr>
<td></td>
<td>b. For each corresponding field selected, select User UPN or User DN.</td>
</tr>
<tr>
<td></td>
<td>NOTE: This field is required in a cross-realm Kerberos environment.</td>
</tr>
</tbody>
</table>

8. If you selected reverse proxy, then you must also add the FQDN and port for the allowed servers. This must be the FQDN of the backend resource. Wildcards are not supported. If you did not select Derive Service Principal Name (SPN) from fully qualified Server Name, then you must also add the SPN.

9. Click Next, then Click Save

Standalone Sentry restarts when the profile is pushed to Standalone Sentry.

Cross-realm Kerberos support

Support for cross-realm Kerberos on the Standalone Sentry is enabled by default, and does not require any actions from the administrator.

Cross-realm S4U2Self is supported. Cross-realm S4U2Proxy is not supported.

Configuring Kerberos authentication for DFS

Authentication to DFS servers using Kerberos requires additional setup in the KDC and the Standalone Sentry system manager. To support Kerberos authentication for DFS, map the SPN of the CIFS service domain to one of its domain controllers (DC). If your Kerberos environment has multiple domain controllers (DC), to avoid authentication failure, add the DC you are mapping to as a static host in the Standalone Sentry system manager.

If your Kerberos environment has multiple domain controllers (DC), note that you can only map the SPN of the CIFS service domain to one DC.
Before you begin

Setup Standalone Sentry for authentication using Kerberos. See Authentication using an Identity certificate and Kerberos constrained delegation

Procedure

1. Map the SPN of the domain to one of its Domain Controllers (DC).
2. On the KDC, associate the Standalone Sentry service account to the CIFS service.
3. If the domain contains multiple DCs, add a static host for the DC in the Standalone Sentry system manager:
   a. Sign in to the Standalone Sentry system manager.
   b. Go to Settings > Static Hosts.
   c. Click Add.
   d. Configure the following:
      - IP address: IP address of the DC.
      - FQDN: FQDN of the DC entered in Step 1.
      - Alias: short name of DC followed by space.
      - Example:
        - IP Address: 192.168.10.5
        - FQDN: win2k8.texas.enterprise.com
        - Alias: win2k8 texas.enterprise.com
   e. Click Save.

Working with connections through Standalone Sentry

Standalone Sentry connections on MobileIron Cloud
Connections from managed devices
Unmanaged connections

Standalone Sentry connections on MobileIron Cloud

Devices connecting to backend resources through Standalone Sentry can be managed (registered with MobileIron Cloud) or unmanaged (not registered with MobileIron Cloud).

A record of users attempting to connect from managed devices is provided in Devices > Devices. A record of the users attempting to connect from unmanaged devices is provided in Devices > Unmanaged Connections.

Related topics
• Connections from managed devices.
• Unmanaged connections.

Connections from managed devices

Typically, devices register with a MobileIron Cloud, which provides the devices with the configurations that allow users on the devices to access backend resources.

To view the users on managed devices that connect to your ActiveSync server or any other backend resource through Standalone Sentry, in MobileIron Cloud, go to Devices, click on a device name, then click on the Sentry tab. Information displayed on this page is updated when Standalone Sentry syncs with Cloud.

Each unique combination of user (email account) on the device and app connecting to the backend resource displays as a separate record in the in the Sentry tab. If there are multiple accounts on the device, then each User is listed. If multiple apps are being used, then each app (User-Agent) is displayed as a separate record.
• Information displayed in each record for a connection from a managed device.
• Taking action on a record for a connection from a managed device.

Information displayed in each record for a connection from a managed device

The following table describes the information displayed for each record in the MobileIron Cloud in Devices > Sentry.
### Table 18. Information displayed for Standalone Sentry connections

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>The device user.</td>
</tr>
<tr>
<td>Sentry Hostname</td>
<td>The Standalone Sentry hostname through which the device is connecting with the ActiveSync server or the backend resource.</td>
</tr>
<tr>
<td>User-Agent</td>
<td>The app connecting to the backend resource. This could be the email app or any other app connecting to the ActiveSync server or backend resource.</td>
</tr>
<tr>
<td>Version</td>
<td>The app version.</td>
</tr>
<tr>
<td>Bundle Id</td>
<td>Bundle Id of the app connecting to the backend resource.</td>
</tr>
<tr>
<td>Status</td>
<td>Indicates whether the device is <strong>Allow</strong> or <strong>Block</strong>. The status for a connection is blocked if the device is out of compliance.</td>
</tr>
<tr>
<td>Actions</td>
<td>Administrators can <strong>Allow</strong>, <strong>Block</strong>, or <strong>Delete</strong> a record.</td>
</tr>
</tbody>
</table>

### Taking action on a record for a connection from a managed device

Actions applied on a Standalone Sentry connection record only impacts the user associated with the app in that record. The user using another app or the same user on another device is not impacted. The only action you can take on a record is delete.

Deleting a record removes the record from the list in **Devices > Sentry**. However, if the device attempts to connect to the backend resource

**Procedure**

1. In MobileIron Cloud, go to **Devices > Devices**.
2. Click the name for a record.
3. Click on the **Sentry** tab.
4. Click **Delete** for the record you want to delete.

### Unmanaged connections

Sometimes users can access backend resources through Standalone Sentry from devices that are not managed by MobileIron Cloud. In these cases these connections are displayed in **Devices > Unmanaged Connections**.

**Related topics**

- Information displayed in each record for a connection from an unmanaged device.
- Taking action on a record for an unmanaged connection.
Information displayed in each record for a connection from an unmanaged device

The following table describes the information displayed for each record in the MobileIron Cloud in Devices > Unmanaged Connections.

**TABLE 19. INFORMATION DISPLAYED FOR CONNECTIONS FROM UNMANAGED DEVICES**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>The device user.</td>
</tr>
<tr>
<td>Connection Source</td>
<td>The device type from which the connection is made.</td>
</tr>
<tr>
<td>ActiveSync Id</td>
<td>ActiveSync Id of user connecting to the backend resource. Only connections to the ActiveSync server can be from unmanaged devices.</td>
</tr>
<tr>
<td>Override Action</td>
<td>Displays the <strong>Action</strong> taken on the unmanaged connection by the administrator. The actions displayed are <strong>Allow</strong> or <strong>Block</strong>.</td>
</tr>
<tr>
<td>Status</td>
<td>Indicates whether the device is <strong>Allow</strong> or <strong>Block</strong>. The status for a connection is <strong>Allow</strong> if the <strong>Allow unmanaged devices to receive email and data</strong> setting is enabled or the connection was previously allowed by the administrator, and <strong>Block</strong> if it is disabled.</td>
</tr>
<tr>
<td>Created At</td>
<td>The date and time the connection was created.</td>
</tr>
<tr>
<td>Sentry Hostnames</td>
<td>The Standalone Sentry hostname through which the device is connecting with the ActiveSync server or the backend resource.</td>
</tr>
</tbody>
</table>

Taking action on a record for an unmanaged connection

Actions applied on a Standalone Sentry connection record only impacts the user associated with the device in that record. The user using another app or the same user on another device is not impacted. You can take the following actions on connections from unmanaged devices:

- **Allow**: Apply the action on a record that was manually blocked or blocked by configuration. Allows the user on the device in the record to access the ActiveSync server.
- **Block**: Blocks the user on the device in the record from accessing the ActiveSync server.
- **Delete**: Deleting a record removes the record from the list. However, if the device attempts to connect to the backend resource it is allowed or blocked depending on whether the **Allow unmanaged devices to receive email and data** setting is enabled or disabled.

**Procedure**

1. In MobileIron Cloud, go to Devices > Unmanaged Connections.
2. Select a record on which you want to take action.
3. Click **Action** and select the action to apply.
Standalone Sentry Settings

The following describe the Standalone Sentry settings in the Standalone Sentry System Manager:

Overview of Standalone Sentry settings
Interfaces
Routes
DNS and Hostname
Static Hosts
Date and Time (NTP)
CLI
Splunk
Syslog
SNMP
Email Settings
Services
Sentry
Incoming SSL configuration
Outgoing SSL configuration
UEM SSL Configuration
Access SSL Configuration
Outbound HTTP Proxy
Log representation and format

Overview of Standalone Sentry settings

The settings tab in the Standalone Sentry System Manager contains links for configuring Standalone Sentry. To log in to the Sentry System Manager, go to https://fully_qualified_hostname:8443.
### Table 20. Configuration Links in the Settings Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>

</table>

### Interfaces

The **Settings > Interfaces** screen enables you to change parameters for the network interface points for Standalone Sentry:
- physical and VLAN interfaces
- static routes

**NOTE:** Physical and VLAN interface fields are not editable for a Standalone Sentry installed on Amazon Web Services (AWS) or on Microsoft Azure. These are assigned by the AWS or the Microsoft Azure infrastructure.

You configure a physical network interface as part of the installation process. You can use the Interfaces screen to:
- Edit the physical interface settings specified during installation
• Add physical interfaces
• Add VLAN interfaces
• Change VLAN interfaces

Physical interface mapping to M2600 NIC ports

The following table provides a mapping of the physical interface name in the MobileIron Core System Manager to the physical NIC port in the M2600 appliance. The six Gigabit Ethernet interfaces are available only on an M2600 appliance.

<table>
<thead>
<tr>
<th>Physical interface</th>
<th>M2600 NIC port</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet1</td>
<td>I - eth0 (NIC-3)</td>
</tr>
<tr>
<td>GigabitEthernet2</td>
<td>J - eth1 (NIC-4)</td>
</tr>
<tr>
<td>GigabitEthernet3</td>
<td>K - eth2 (NIC-5)</td>
</tr>
<tr>
<td>GigabitEthernet4</td>
<td>L - eth3 (NIC-6)</td>
</tr>
<tr>
<td>GigabitEthernet5</td>
<td>C - eth4 (NIC-1)</td>
</tr>
<tr>
<td>GigabitEthernet6</td>
<td>D - eth5 (NIC-2)</td>
</tr>
</tbody>
</table>

Changing physical interfaces

You can change the physical interfaces for Standalone Sentry in the Sentry System Manager.

Procedure
1. Click the interface name.

![Figure 7. Modify physical interfaces](image)

2. Change any or all of the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP</td>
<td>Enter the IP address of the physical network interface. Unless you are configuring a standalone implementation for a small trial, you should</td>
</tr>
</tbody>
</table>
### Adding VLAN interfaces

Virtual Local Area Network (VLAN) interfaces are optional interfaces you can configure on MobileIron UEM to manage bandwidth and load balancing. You can add a VLAN interface in the Standalone Sentry System Manager.

**Procedure**

1. Click **Add VLAN**.

2. Use the following guidelines to complete the configuration:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Specify a number between 2 and 4094.</td>
</tr>
<tr>
<td>IP Address</td>
<td>Enter the IP address for this VLAN interface.</td>
</tr>
<tr>
<td>Mask</td>
<td>Enter the netmask for this VLAN interface.</td>
</tr>
<tr>
<td>Physical Interface</td>
<td>Select the physical interface that corresponds to this VLAN interface.</td>
</tr>
<tr>
<td>ACL Name</td>
<td>Select an Access Control List for this interface. See <a href="#">Access Control Lists</a>.</td>
</tr>
<tr>
<td>Admin State</td>
<td>To enable this interface, click Enable. To temporarily suspend use of this VLAN, click Disable.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
Deleting a VLAN interface

You can delete the Standalone Sentry Virtual Local Area Network (VLAN) interface in the Sentry System Manager.

Procedure
1. Select the VLAN you want to remove.
2. Click Delete VLAN.

Routes

The **Settings > Network > Routes** screen enables you to create and maintain static network routes within the enterprise.

**Figure 9. Standalone Sentry Routes**

Adding network routes

You can add network routes in the Standalone Sentry System manager in **Settings > Network > Routes**.

Procedure
1. In the Standalone Sentry System Manager go to **Settings > Network > Routes**.
2. Click **Add**.
Figure 10. Adding Network Routes

3. Use the following guidelines to complete the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Enter the network IP address.</td>
</tr>
<tr>
<td>Mask</td>
<td>Enter the subnet mask.</td>
</tr>
<tr>
<td>Gateway</td>
<td>Enter the IP address for the gateway.</td>
</tr>
</tbody>
</table>

4. Click Save.

Deleting network routes

You can delete the network routes in the Standalone Sentry System manager.

Procedure
1. In the Standalone Sentry System Manager go to Settings > Network > Routes.
2. Select the entry.
3. Click Delete.

DNS and Hostname

The DNS and Hostname screen displays the hostname, default domain, and DNS information entered during installation. Use this screen to:

- Change the hostname
- Change the default domain
- Change or add DNS servers

NOTE: DNS and hostname fields are not editable for a Standalone Sentry installed on Amazon Web Services (AWS) or on Microsoft Azure. These are assigned by the AWS or the Microsoft Azure infrastructure.
Figure 11. DNS and Hostname

The following table describes the fields for DNS and hostname.

Table 22. DNS and Hostname Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host name</td>
<td>Specify the fully-qualified host name for the appliance.</td>
</tr>
<tr>
<td>Default Domain</td>
<td>Specify the default domain for the appliance.</td>
</tr>
<tr>
<td>Preferred DNS Server</td>
<td>Specify the IP address of the primary DNS server to use.</td>
</tr>
<tr>
<td>Alternate DNS Server 1</td>
<td>Specify the IP address of an optional alternate DNS server.</td>
</tr>
<tr>
<td>Alternate DNS Server 2</td>
<td>Specify the IP address of an optional alternate DNS server.</td>
</tr>
</tbody>
</table>

Static Hosts

The Static Hosts page enables you to edit the hosts file for the Standalone Sentry appliance.
Adding hosts

You can add an entry to the hosts file on the Standalone Sentry appliance in the Sentry System Manager.

Procedure
1. In the Standalone Sentry System Manager go to **Settings > Static Hosts**.
2. Click the **Add** button.

3. Use the following guidelines to complete the displayed fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>The IP address for the host you are adding.</td>
</tr>
<tr>
<td>FQDN</td>
<td>The fully-qualified domain name for this host, as in myserver.mycompany.com.</td>
</tr>
<tr>
<td>Alias</td>
<td>The alias for this host. Up to 29 aliases are allowed.</td>
</tr>
</tbody>
</table>

**NOTE:** No more than 799 characters are allowed for each host entry. Each host entry includes the IP address, FQDN, and the alias.
4. Click **Save**.

**Editing hosts**

To edit an entry in the hosts file on the Sentry appliance, click the IP address for the host displayed in the **Static Hosts** screen in the Standalone Sentry System Manager in **Settings > Static Hosts**.

**Deleting hosts**

To delete an entry in the hosts file on the Sentry appliance, select the IP address for the host displayed in the **Static Hosts** screen in the Standalone Sentry System Manager in **Settings > Static Hosts**.

**Procedure**

1. In the **Static Hosts** screen, select the host to be deleted.
2. Click **Delete**.

**Date and Time (NTP)**

The Date and Time screen displays any NTP information specified during installation. This is an optional portion of the configuration, but is highly recommended due to the effect of database timestamps on the behavior of the system, as well as on the quality of reporting. Currently, only UTC time display is supported. If you choose to use a local time source, instead, then you can specify the date in this screen.

**FIGURE 14. DATE AND TIME (NTP)**

The following table describes the fields for setting the system date and time.
TABLE 23. DATE AND TIME (NTP)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Source</td>
<td>Select NTP if you intend to specify one or more NTP servers. Select Local if you intend to set the system time for the MobileIron Server.</td>
</tr>
<tr>
<td>If you select NTP</td>
<td></td>
</tr>
<tr>
<td>Primary Server</td>
<td>Specify the IP address or fully-qualified host name for the NTP server to use.</td>
</tr>
<tr>
<td>Secondary Server</td>
<td>Specify the IP address or fully-qualified host name for the first failover NTP server to use.</td>
</tr>
<tr>
<td>Tertiary Server</td>
<td>Specify the IP address or fully-qualified host name for the second failover NTP server to use.</td>
</tr>
<tr>
<td>If you select Local</td>
<td></td>
</tr>
<tr>
<td>Date</td>
<td>Enter the current date.</td>
</tr>
<tr>
<td>Time</td>
<td>Enter the current time.</td>
</tr>
</tbody>
</table>

CLI

The CLI screen displays the command line interface access settings specified during configuration. Use this screen to alter these settings.

For information about using the CLI, see Command Line Interface.

The following table describes the CLI settings.

TABLE 24. CLI FIELD DESCRIPTIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Secret</td>
<td>Click the Change Enable Secret link to specify the password required to access important functions in the CLI.</td>
</tr>
<tr>
<td>Confirm Enable Secret</td>
<td>Re-enter the specified password to confirm. This field displays only if you click the Change Enable Secret link.</td>
</tr>
<tr>
<td>CLI Session Timeout</td>
<td>Specify the duration of inactivity on the SSH connection that should cause the session to time out.</td>
</tr>
<tr>
<td>SSH</td>
<td>Select Enable if you want to allow SSH access to the MobileIron Administration tool.</td>
</tr>
<tr>
<td>Max SSH Sessions</td>
<td>Specify the maximum number of simultaneous SSH sessions to allow.</td>
</tr>
</tbody>
</table>
You can configure a Splunk entry on Standalone Sentry so that Standalone Sentry periodically sends Sentry health and audit log data to the Splunk Enterprise server set up on your network. Logs are forwarded to the Splunk receiver and to the local log location.

Overview of the steps for setting up Splunk on Standalone Sentry

Following is an overview of the steps for setting up Splunk on Standalone Sentry:
1. Enabling the Splunk forwarder service in Standalone Sentry.
2. Adding a Splunk receiver entry in Standalone Sentry.
3. Configuring Standalone Sentry data to export to Splunk.
4. Tasks in Splunk server to set up Standalone Sentry

Enabling the Splunk forwarder service in Standalone Sentry

Enable the Splunk forwarder service so that it can push data to the Splunk receiver.

NOTE: The Splunk forwarder service can also be enabled using CLI.

Procedure
1. In Standalone Sentry System Manager, go to **Settings > Services**.
2. For **Splunk Forwarder**, select **Enable**.
3. Click **Apply > OK** to save the changes.
   The status for Splunk Forwarder displays as **Running**.

Next steps

Go to **Adding a Splunk receiver entry in Standalone Sentry**.

Adding a Splunk receiver entry in Standalone Sentry

You add the Splunk receiver in the Standalone Sentry System Manager in **Settings > Splunk**.

Procedure
1. In Standalone Sentry System Manager, go to **Settings > Splunk**.
2. Click **Add** to open the **Add Splunk Receiver** window.
3. Configure the fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Splunk Receiver</td>
<td>Add the IP address or the hostname of your Splunk Enterprise Server.</td>
</tr>
<tr>
<td>Port</td>
<td>Add the port of your Splunk Enterprise Server.</td>
</tr>
<tr>
<td>Enable SSL</td>
<td>(Optional) Click the check box to enable SSL.</td>
</tr>
</tbody>
</table>

4. Click **Apply > OK** to save the changes.
Next steps

Go to Configuring Standalone Sentry data to export to Splunk.

Configuring Standalone Sentry data to export to Splunk

Use the Standalone Sentry command line interface (CLI) to configure the data to export to Splunk.

Procedure
1. SSH to Standalone Sentry.
2. In configuration mode, enter `sentry audit` to enable miauditlogs log data for export.
3. In configuration mode, enter `sentry health-monitor` to enable mihealth log data for export.
4. Enter end to exit configuration mode.

Next steps

Go to Tasks in Splunk server to set up Standalone Sentry.

Related topics

See Log representation and format for the representation and the format of the data captured in audit and health logs.

Tasks in Splunk server to set up Standalone Sentry

Do the following on the Splunk server:
1. Ensure that Splunk listener is on the same port as the one configured in the Splunk entry in Standalone Sentry.
2. Enable the miauditlog and mihealth indexes, which are `sentry_miaudit` and `sentry_mihealth` respectively.

Syslog

You can send Sentry syslog data to a remote log server you have set up on your network. Logs are then written to both the syslog location and the local log location.

Adding a syslog entry

You add the syslog server in the Standalone Sentry System Manager in Settings > Syslog.

Procedure
1. In Sentry System Manager, go to Settings > Syslog.
2. Click Add.
3. Enter the requested information.
4. Click Apply.
Related topics

See the field descriptions for a Syslog entry in Field descriptions for a syslog entry.

Editing a syslog server entry

Settings > Syslog lists the syslog server you have configured on Sentry. You can edit the syslog server setting you have configured.

Procedure

1. In Sentry System Manager, go to Settings > Syslog.
2. Click on the IP address or hostname of the syslog server you want to edit.
3. Update the settings as needed.
   You cannot update the server address or hostname.
4. Click Apply to save and apply the changes.

Related topics

See the field descriptions for a Syslog entry in Field descriptions for a syslog entry.

**Adding MobileIron Monitor as a syslog server**

MobileIron Monitor allows IT and system administrators to monitor the health of all their mission-critical MobileIron EMM components and services. MobileIron Monitor organizes and displays monitoring data pushed from MobileIron Sentry, providing you a comprehensive view of system status and alerts.

**Before you begin**

- You must have set up MobileIron Monitor. For information on how to set up MobileIron Monitor, see the MobileIron Monitor Configuration Guide.

**Procedure:**

1. In MobileIron Sentry System Manager, go to **Settings > Syslog**.
2. Click **Add**.

---

Adding MobileIron Monitor as a syslog server...
3. Provide values for the Add Syslog dialog fields:
   a. **Server**: Enter the IP address of MobileIron Monitor.
   b. **Port**: Use the default port 514.
   c. **Protocol**: Select the desired protocol.
   d. **Facility Type**: Select General. Only General is supported.
   e. **Log Level**: Select the desired log level.
   f. **Admin State**: Select Enable.

4. Click **Apply**.

---

**SNMP**

Simple Network Management Protocol (SNMP) is a protocol used for network management for collecting information about network entities, such as servers and devices, on an Internet Protocol (IP) network. Various third-party SNMP systems are available that provide SNMP-based management and tools.

MobileIron Sentry provides the following SNMP capabilities:

- **Link up and down traps**
  Sentry sends these two SNMP traps (events) to a specified SNMP trap receiver using the SNMP v2c protocol.
- **An SNMP server can request information from Sentry related to these MIBs**:
  - The HOST-RESOURCES_MIB
  - disk I/O (UCD-DISKIO-MIB)
- **Support for SNMP v2c and v3 protocols to pull MIB information from Sentry to the SNMP server**.
  It is recommended to use v3 protocol if you transmit information across unsecured links.

Use the SNMP screen to manage SNMP trap receivers.

**Configuring SNMP on MobileIron Sentry**

The following provides the general workflow to configure SNMP:

1. **Configuring the SNMP trap receiver server** to which Sentry sends SNMP traps.
2. **Enabling the SNMP service with the v3 protocol** from whom Sentry accepts requests.
3. **Enabling the SNMP service with the v2c protocol** between Sentry and your SNMP server.

**Configuring the SNMP trap receiver server**

Configure the server to which Sentry sends SNMP traps. This server can also get MIB information from Sentry.

**Procedure**

1. Log into Sentry.
2. Go to **Settings > SNMP** to open the SNMP details pane.
3. Click **Add** to open the **Add SNMP Trap Receiver** window.
4. Edit the fields, as necessary. 
   Refer to the SNMP table for details.
5. Click Apply > OK to save the changes.

Add SNMP trap receiver field description

The following table summarizes fields and descriptions in the Add SNMP Trap Receiver window:

### Table 26. Fields and descriptions in the Add SNMP Trap Receiver window

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Enter the IP address or server name for your SNMP trap receiver. For example:</td>
</tr>
<tr>
<td>Port</td>
<td>By default, port 162 is configured. Edit this field if you are using a different port.</td>
</tr>
<tr>
<td>Community</td>
<td>Enter the string which names the SNMP community on your SNMP trap receiver.</td>
</tr>
<tr>
<td>Version</td>
<td>MobileIron Sentry sends SNMP traps using SNMP protocol v2c.</td>
</tr>
<tr>
<td>Admin State</td>
<td>Select Enable to enable the SNMP service for this SNMP server.</td>
</tr>
</tbody>
</table>

**Editing a trap receiver**

To edit an SNMP trap receiver, navigate to Settings > SNMP in the Standalone Sentry System Manager.

**Procedure**

1. In the Standalone Sentry System Manager, navigate to Settings > SNMP.
2. In the SNMP screen, select the link for the trap receiver you want to edit:
3. Make your changes.
4. Click Save.

**Deleting SNMP trap receiver servers**

To delete one or more SNMP trap receiver, navigate to Settings > SNMP in the Standalone Sentry System Manager.

**Procedure**

1. In the Standalone Sentry System Manager, navigate to Settings > SNMP to open the SNMP details pane.
2. Select one or more of the servers you want to delete.
   Click the box next to Server to select all servers in the list.
3. Click Delete > Yes.
Enabling the SNMP service with the v3 protocol

Set up the SNMP v3 user from whom Standalone Sentry accepts requests. In addition, you can enable or disable sending traps to any configured SNMP trap receiver.

Procedure

1. Log into Standalone Sentry System Manager.
2. Go to Settings > SNMP to open the SNMP details pane.
3. In the SNMP Control section, select Enable for SNMP Service to enable the SNMP service on Standalone Sentry.
4. Go to the Protocol option and verify that v3 is selected. The v3 option is selected, by default.
5. Click Add to open the Add SNMP v3 User window.
6. Enter the SNMP v3 user fields, as necessary.
7. Click Save to add this user to the SNMP v3 Users table.
8. Go to Link Up/Down Trap.

9. Select Enable. Select Disable to stop Sentry from sending SNMP traps to any SNMP trap receiver.

10. Click Apply > OK to save the changes.

Related topics
Refer to the SNMP for details.

SNMP v3 User field description

The following table describes the SNMP v3 user fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Enter the username without any spaces (example: miuser).</td>
</tr>
<tr>
<td>Security Level</td>
<td>Select a security level for authentication. The options are:</td>
</tr>
<tr>
<td></td>
<td>• noAuthNoPriv: Without Authentication or Privacy.</td>
</tr>
<tr>
<td></td>
<td>• authNoPriv: With Authentication and without Privacy</td>
</tr>
<tr>
<td></td>
<td>• authPriv: With Authentication and with Privacy</td>
</tr>
<tr>
<td>Auth Protocol</td>
<td>Select an authentication protocol. This can be selected only if the Security Level is selected as authNoPriv or authPriv.</td>
</tr>
<tr>
<td>Auth Password</td>
<td>Enter a password for authentication. The password must contain at least characters.</td>
</tr>
<tr>
<td>Privacy Protocol</td>
<td>Select a privacy protocol. This can be selected only if Security Level is selected as authPriv.</td>
</tr>
<tr>
<td>Privacy Password</td>
<td>Enter a privacy password with minimum of 8 characters.</td>
</tr>
</tbody>
</table>

Deleting SNMP v3 users

The following describes how to delete one or more SNMP v3 users.

Procedure
1. Log into Sentry.
2. Go to Settings > SNMP to open the SNMP details pane.
3. Go to the SNMP Control group.
4. Select one or more of the users you want to delete.
   Click the box next to User Name to select all users in the list.
5. Click Delete > Yes.
Enabling the SNMP service with the v2c protocol

Set up the SNMP v2c communication between MobileIron Sentry and your SNMP server. You also enable or disable sending traps to any configured SNMP trap receiver.

Procedure

1. Log into Sentry.
2. Go to Settings > SNMP to open the SNMP details pane.
3. Go to the SNMP Control section > SNMP Service.
4. Select Enable to enable the SNMP service on Standalone Sentry.
5. Go to the Protocol option and select v2c.
6. Change the value of Read Only Community if necessary.
   The standard SNMP community string name is public. This is the community string that the SNMP server uses to pull MIB information from MobileIron Sentry.
7. Go to the Link Up/Down Trap option and select Enable.
   Select Disable to stop MobileIron Sentry from sending SNMP traps to any SNMP trap receiver.
8. Click Apply > OK to save the changes.

Editing the Read Only Community string

The community string is available for v2 protocol. The default community string for the SNMP is set to public. To change this string, navigate to Settings > SNMP in the Standalone Sentry System Manager.

Procedure

1. In the Standalone Sentry System Manager, navigate to Settings > SNMP.
2. Edit the default string.
3. Click Apply.

Email Settings

Use the Email Settings page to configure the SMTP server. This configuration is required for Sentry monitoring alert notifications by email.
Configuring the SMTP server information for Standalone Sentry notifications

Configure the SMTP server information required for Sentry alert notifications.

Procedure

1. In the Sentry System Manager, go to **Settings**.
2. Click **Email Settings** in the left navigation pane.
3. Enter the requested information.
4. Click **Test**.
5. Enter an email address and body for the test email.
6. Click **OK**.
7. Confirm that the email arrives as expected.
8. Click **Save**.

For a description of the fields for configuring SMTP, see **Field descriptions for SMTP settings**.

Field descriptions for SMTP settings

The following table describes the fields for configuring SMTP settings.
TABLE 28. FIELD DESCRIPTIONS FOR SMTP SETTINGS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Email</td>
<td>Specify the email address to use in the From field for all administrative email notifications.</td>
</tr>
<tr>
<td>SMTP Server</td>
<td>Specify the IP address or fully-qualified host name for the SMTP server the MobileIron Server will use.</td>
</tr>
<tr>
<td>SMTP Server Port</td>
<td>Specify the port configured for the SMTP server.</td>
</tr>
<tr>
<td>Protocol</td>
<td>If the SMTP server you are configuring is a secured server, that is, it uses the SMTPS protocol, then select the SMTPS button. Otherwise, leave SMTP selected.</td>
</tr>
<tr>
<td>Authentication Required</td>
<td>Specify whether this SMTP server requires authentication. In most cases, this field will be set to Yes.</td>
</tr>
<tr>
<td>User Name</td>
<td>If you select Yes for Authentication Required, then this field displays. Enter the user name required for SMTP authentication.</td>
</tr>
<tr>
<td>Password</td>
<td>If you select Yes for Authentication Required, then this field displays. Enter the password required for SMTP authentication.</td>
</tr>
<tr>
<td>Confirm Password</td>
<td>If you select Yes for Authentication Required, then this field displays. Confirm the password required for SMTP authentication.</td>
</tr>
</tbody>
</table>

Services

Use the **Services** screen to enable or disable the Sentry service. Select **Enable** or **Disable**, then click **Apply**. The status displays to the right of the setting. **Running** indicates that the Sentry service is enabled. **Not Running** indicates that the Sentry service is disabled.
**FIGURE 17. ENABLE OR DISABLE SENTRY SERVICE**

![Enable or Disable Sentry Service](image)

**Sentry**

Use the **Settings > Services > Sentry** screen to change the default setting for whether new devices are allowed or not allowed to access the ActiveSync server or backend resource when MobileIron UEM is inaccessible.

**FIGURE 18. NEW DEVICE ACCESS WHEN UEM IS UNREACHABLE**

![New Device Access When UEM is Unreachable](image)
New device access

Use the **New device access when EMM server is unreachable** setting to allow or block new devices or devices not in the Standalone Sentry cache, access to the ActiveSync server or backend resource if MobileIron UEM is not reachable.

By default Standalone Sentry allows new devices access to the server if the UEM is not reachable.

**NOTE:** Changing the **New device access when EMM server is unreachable** setting does not restart Standalone Sentry.

To block new devices from accessing the server when MobileIron UEM is unreachable, select **Block** from the drop down list and click **Apply**.

Incoming SSL configuration

For MobileIron Cloud, cipher suites and protocols configuration is done in the Sentry profile on Cloud.

Outgoing SSL configuration

For MobileIron Cloud, cipher suites and protocols configuration is done in the Sentry profile on Cloud.

The **Outgoing SSL Configuration** page Allows administrators the flexibility to configure Standalone Sentry to use cipher suites and protocols to match the security and system needs of your enterprise.

UEM SSL Configuration

Use the **EMM SSL Configuration** page to configure the client role parameters for communication from Sentry to UEM. You can configure ciphers and protocols for outgoing traffic from Sentry to UEM.

- **Enabling Strict TLS** settings for Standalone Sentry SSL connections to UEM.
- **Enabling Server Name Indication (SNI)**.
- View the **Available** and **Selected** protocols and cipher suites. See **Cipher Suites and Protocols**.
- Set up custom protocol and cipher suite configuration. See **Cipher Suites and Protocols**.

The **EMM SSL Configuration** page allows the administrator the flexibility to configure Standalone Sentry to use cipher suites and protocols to match the security and system needs of your enterprise.

Enabling Strict TLS

You can enable strict TLS for outgoing traffic from Standalone Sentry to UEM. Strict TLS is not enabled by default for the UEM server. However, it is enabled for MobileIron Cloud. When you enable strict TLS, the Java Trust Store
is enabled by default. You can also use the custom trust store option to upload additional certificates that Standalone Sentry must use.

Procedure
1. In the Standalone Sentry System Manager, go to Settings > Services > Sentry > EMM SSL Configuration.
2. In the Strict TLS Settings section, check Enable Strict TLS.
   Additional options are now available.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Default Java Trust Store</td>
<td>Selected by default if strict TLS is enabled. Certificates and Certificates Authorities in the Java Trust Store are used to trust the SSL connection to UEM.</td>
</tr>
<tr>
<td>Allow and Log untrusted servers</td>
<td>Select to allow Standalone Sentry to connect to UEM that does not use a trusted certificate in Java or custom trust store.</td>
</tr>
<tr>
<td>Enable Custom Trust Store</td>
<td>Select to upload certificates to the Standalone Sentry trust store. Standalone Sentry uses the certificates in the custom store to trust UEM. Generally used if UEM uses self-signed certificates.</td>
</tr>
</tbody>
</table>

3. Click Apply.
4. Click Yes.
   The new TLS settings are applied and Standalone Sentry restarts. It may take up to one minute for Standalone Sentry to restart. Traffic is disrupted till Standalone is up and running again.
5. Click OK.

Enabling Server Name Indication (SNI)

Server Name Indication (SNI) is an extension to TLS. SNI allows multiple hostnames to be served over HTTPS from one IP address. By default, SNI is disabled on Standalone Sentry for outgoing connections for the UEM server. However, SNI is enabled (read-only) for Cloud UEM server. SNI allows a load balancer to direct incoming traffic to the correct UEM server based on the hostname provided by the client, in this case, Standalone Sentry. Some UEM servers may require that SNI is enabled in the client. Your Active Directory Federation Services (ADFS) may require SNI for all client communications.

NOTE: If SNI is enabled for EMM SSL connections, in some cases health check may fail if the backend server does not also support SNI. The workaround is to disable health check for the impacted server.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > EMM SSL Configuration.
2. Click Enable SNI.
3. Click Apply.
Cipher Suites and Protocols

Standalone Sentry includes a set of cipher suites and protocols. A default set of cipher suites and protocols is available in the Selected column. You can customize the Selected list of ciphers and protocols to match the security and system needs for your enterprise.

The available and default set of cipher suites and protocols may be updated in a release. Some cipher suites and protocols may be added, while others may be removed. Cipher suites and protocols may be removed if the platform no longer supports these cipher suites and protocols.

If you are set up to use the default cipher suites and protocols, these will be updated to the latest defaults when you upgrade to a new version of Standalone Sentry. If you are set up to use a custom list of Selected cipher suites and protocols, the custom list is preserved when you upgrade your Standalone Sentry. However, any cipher suites or protocols that were removed will also be removed from the Selected and Available columns. New cipher suites and protocols will be added to the Available column.

WARNING: Making changes to the selected list of cipher suites may impact the performance and security of traffic through Standalone Sentry. Therefore, before making any changes to the Selected cipher suites, MobileIron recommends that you understand both the performance and security impact of the changes.

Note The Following:
- SSLv2Hello is a pseudo-protocol that allows Java to initiate the handshake with an SSLv2 ‘hello message.’ This does not cause the use of the SSLv2 protocol, which is not supported by Java. SSLv2Hello requires that TLSv1 protocol is also selected.
- SSLv2Hello is required by some load balancers and SSL off loaders for proper functioning. If your environment does not need it, it is recommended to remove this from the protocol list for improved security.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > EMM SSL Configuration. Ciphers and protocols are configured in the Sentry to Backend Ciphers, SNI, and Protocols Configuration section.
   The Use Default Cipher Suites and Protocols (recommended) option is selected by default.
2. Select Use Custom Configuration.
3. Click Proceed to continue.
4. Select the protocols and cipher suites to move from the Available to Selected column or vice-versa as necessary.
   The default cipher suites and protocols are colored blue.
5. Click Apply to save the changes.

NOTE: When Use Default Cipher Suites and Protocols (recommended) is selected, the cipher suites and protocols can be moved between the Available and Selected columns. However, the configuration is not changed. You must also select the Use Custom Configuration option to make changes to the default configuration.
Switching back to default configuration

You can revert your settings to default configuration if you do not wish to use the custom configuration.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > EMM SSL Configuration.
2. In the Sentry to EMM Ciphers, SNI, and Protocols Configuration section, select Use Default Cipher Suites and Protocols (recommended).
3. Click Apply to save the changes.
   The cipher suites and protocols are reset to the default settings.
   Clicking on Reset to Default resets the Available and Selected columns to default settings. However, the default settings will not be applied. To apply the default settings, you must select Use Default Cipher Suites and Protocols (recommended), and then click Apply.

Access SSL Configuration

Use the Access SSL Configuration page to configure the client role parameters for communication from Sentry to Access. You can configure ciphers and protocols for outgoing traffic from Sentry to Access.

- Managing Strict TLS settings for Standalone Sentry SSL connections to Access.
- Server Name Indication (SNI).
- View the Available and Selected protocols and cipher suites. See Cipher suites and protocols.
- Set up custom protocol and cipher suite configuration. See Customizing cipher suites and protocols.

The Access SSL Configuration page allows the administrator the flexibility to configure Standalone Sentry to use cipher suites and protocols to match the security and system needs of your enterprise.

Managing Strict TLS

You can enable strict TLS for outgoing traffic from Standalone Sentry to Access. Strict TLS is enabled by default. With strict TLS enabled, the Java Trust Store is enabled by default. You can also use the custom trust store option to upload additional certificates that Standalone Sentry must use.

Procedure
1. In the Standalone Sentry System Manager, go to Settings > Services > Sentry > Access SSL Configuration.
2. In the Strict TLS Settings section, select or deselect Enable Strict TLS to enable or disable Strict TLS appropriately.
   Additional options are now available.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Default Java Trust Store</td>
<td>Selected by default if strict TLS is enabled.</td>
</tr>
<tr>
<td></td>
<td>Certificates and Certificates Authorities in the Java Trust Store are used to trust the SSL connection to UEM.</td>
</tr>
</tbody>
</table>
### Item | Description
---|---
Allow and Log untrusted servers | Select to allow Standalone Sentry to connect to UEM that does not use a trusted certificate in Java or custom trust store.
Enable Custom Trust Store | Select to upload certificates to the Standalone Sentry trust store. Standalone Sentry uses the certificates in the custom store to trust UEM. Generally used if UEM uses self-signed certificates.

3. Click **Apply**.
4. Click **Yes**.
   The new TLS settings are applied and Standalone Sentry restarts. It may take up to one minute for Standalone Sentry to restart. Traffic is disrupted till Standalone is up and running again.
5. Click **OK**.

### Server Name Indication (SNI)

Server Name Indication (SNI) is an extension to TLS. SNI allows multiple hostnames to be served over HTTPS from one IP address. By default, SNI is enabled on Standalone Sentry for outgoing connections. SNI allows a load balancer to direct incoming traffic to the correct Access server based on the hostname provided by the client, in this case, Standalone Sentry. Access servers require that SNI is enabled in the client. Your Active Directory Federation Services (ADFS) requires SNI for all client communications.

**NOTE:** If SNI is enabled for Access SSL connections, in some cases health check may fail if the Access server does not also support SNI. The workaround is to disable health check for the impacted server.

### Cipher suites and protocols

Standalone Sentry includes a set of cipher suites and protocols. A default set of cipher suites and protocols is available in the Selected column. You can customize the **Selected** list of ciphers and protocols to match the security and system needs for your enterprise.

The available and default set of cipher suites and protocols might be updated in a release. Some cipher suites and protocols might be added, while others may be removed. Cipher suites and protocols might be removed if the platform no longer supports these cipher suites and protocols.

If you are set up to use the default cipher suites and protocols, these are updated to the latest defaults when you upgrade to a new version of Standalone Sentry. If you are set up to use a custom list of Selected cipher suites and protocols, the custom list is preserved when you upgrade your Standalone Sentry. However, any cipher suites or protocols that were removed are also removed from the Selected and Available columns. New cipher suites and protocols are added to the Available column.
WARNING: Making changes to the selected list of cipher suites may impact the performance and security of traffic through Standalone Sentry. Therefore, before making any changes to the Selected cipher suites, MobileIron recommends that you understand both the performance and security impact of the changes.

Note The Following:
- SSLv2Hello is a pseudo-protocol that allows Java to initiate the handshake with an SSLv2 ‘hello message.’ This does not cause the use of the SSLv2 protocol, which is not supported by Java. SSLv2Hello requires that TLSv1 protocol is also selected.
- SSLv2Hello is required by some load balancers and SSL off loaders for proper functioning. If your environment does not need it, it is recommended to remove this from the protocol list for improved security.

Customizing cipher suites and protocols

You can customize the cipher suites and protocols configuration.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > Access SSL Configuration. Ciphers and protocols are configured in the Sentry to CMS Ciphers, SNI, and Protocols Configuration section.
   The Use Default Cipher Suites and Protocols (recommended) option is selected by default.
2. Select Use Custom Configuration.
3. Click Proceed to continue.
4. Select the protocols and cipher suites to move from the Available to Selected column or vice-versa as necessary.
   The default cipher suites and protocols are colored blue.
5. Click Apply to save the changes.

NOTE: When Use Default Cipher Suites and Protocols (recommended) is selected, the cipher suites and protocols can be moved between the Available and Selected columns. However, the configuration is not changed. You must also select the Use Custom Configuration option to make changes to the default configuration.

Switching back to default configuration

You can revert your settings to default configuration if you do not wish to use the custom configuration.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > Access SSL Configuration.
2. In the Sentry to CMS Ciphers, SNI, and Protocols Configuration section, select Use Default Cipher Suites and Protocols (recommended).
3. Click Apply to save the changes.
   The cipher suites and protocols are reset to the default settings.

Clicking Reset to Default resets the Available and Selected columns to default settings. However, the default settings are not applied. To apply the default settings, you must select Use Default Cipher Suites and Protocols (recommended), and then click Apply.
Outbound HTTP Proxy

Use the Outbound HTTP Proxy page to configure the proxy parameters for communication from Sentry to Cloud or Access.

Configuring Outbound HTTP Proxy

The Outbound HTTP Proxy page allows the administrator the flexibility to configure Standalone Sentry with outbound HTTP proxy server settings. The traffic from Sentry passes through the proxy to Cloud or Access. Sentry will use the User Name and Password for authentication if requested by the proxy.

Procedure
1. In Standalone Sentry System Manager, go to Settings > Services > Sentry > Outbound HTTP Proxy.
2. Select MobileIron Cloud to configure the outbound proxy server settings for Cloud.
   a. Enter the Proxy Host.
   b. Enter the Proxy Port.
   c. Enter the User Name.
   d. Enter the Password.
   a. Enter the Proxy Host.
   b. Enter the Proxy Port.
   c. Enter the User Name.
   d. Enter the Password.
4. Click Apply.

Log representation and format

The following provide the representation and format of the data captured in audit and health logs:

• Audit log representation and format
• Health log representation and format

Audit log representation and format

An audit entry is created for each request from a device. A corresponding response entry is created for each request. The audit logs are in JSON format.

The following provide the format for audit log entries:

• Audit log entry for a request
• Audit log entry for a response
• Audit log entry for IP VPN response to tunnel establishment request
• Audit log entry for IP VPN internal connection
Audit log entry for a request

The following provides a description of the fields in the audit log entry for a request.

**TABLE 29. FIELD DESCRIPTIONS FOR A REQUEST IN AUDIT LOG**

Standalone Sentry Security Settings

The following describe the security settings in the Standalone Sentry System Manager:

Overview of Standalone Sentry security settings
Local Users
Password policy
Certificate Management
Access Control Lists
Networks and Hosts
Network Services
Access Control Lists: ACLs

Overview of Standalone Sentry security settings

The Security tab in System Manager contains links for configuring aspects of Sentry access. The following table summarizes the tasks associated with each link.

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Source: Local Users</td>
<td>Create, delete, and manage local users.</td>
</tr>
<tr>
<td>Identity Source: Password Policy</td>
<td>Configure complex passwords for Standalone Sentry.</td>
</tr>
<tr>
<td>Certificate Mgmt</td>
<td>View and manage certificates for Portal HTTPS</td>
</tr>
<tr>
<td>Access Control Lists: Networks &amp; Hosts</td>
<td>Create and manage entries for networks and hosts</td>
</tr>
<tr>
<td>Access Control Lists: Network Services</td>
<td>Create and manage entries for network services</td>
</tr>
<tr>
<td>Access Control Lists: ACLs</td>
<td>Compile access control lists</td>
</tr>
</tbody>
</table>

Local Users

All users in the Standalone Sentry System Manager database are local users having the following privileges, which cannot be changed:
- Command Line Interface (CLI)
- System Manager access
Adding local users for System Manager

You can add local users in the Standalone Sentry System Manager.

Procedure
1. Go to Security > Local Users.
2. Click Add. The Add New User window displays.
3. Use the following guidelines to complete the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Enter the unique identifier to assign to this user.</td>
</tr>
<tr>
<td>First Name</td>
<td>Enter the user’s first name.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Enter the user’s last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a password for the user. For password requirements, see Password policy</td>
</tr>
<tr>
<td>Confirm Password</td>
<td>Confirm the password for the user.</td>
</tr>
<tr>
<td>Group</td>
<td>This field is not configurable.</td>
</tr>
<tr>
<td>Email</td>
<td>Enter the user’s email address.</td>
</tr>
<tr>
<td>EDIPI</td>
<td>Enter the unique identifier assigned to this user. This is a mandatory field to configure CAC.</td>
</tr>
</tbody>
</table>

4. Click Apply.
5. Click Save.

Editing local users for System Manager

You can change the information for local users in the Standalone Sentry System Manager.

Procedure
1. Go to Security > Local Users.
2. Select the user ID of the entry to display the information for that user.
3. Make your changes.

NOTE: You cannot change the user ID.
4. Click Apply.
5. Click Save.

Deleting local users for System Manager

You can delete local users in the Standalone Sentry System Manager.

Procedure
1. Go to Security > Local Users.
2. Select the checkbox for the user you want to delete.
3. Click Delete.
NOTE: You cannot delete the user ID you logged in with.

4. Click Save.

Password policy

Password policy lets you configure complex passwords for Standalone Sentry.

Configuring password policy

To configure the settings in the Standalone Sentry System Manager, go to Security > Identity Source.

Before you begin

- Verify that you have added local users for System Manager.

Procedure

2. Select Password Policy.
3. Configure the password policy for local users appropriately.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum Number of Character Classes in Password</td>
<td>1 to 4. Passwords must contain at least one upper case character, one lower case character, and one numeric character by default.</td>
</tr>
<tr>
<td>Lower Case</td>
<td>Enable or Disable</td>
</tr>
<tr>
<td>Upper Case</td>
<td>Enable or Disable</td>
</tr>
<tr>
<td>Numeric</td>
<td>Enable or Disable</td>
</tr>
<tr>
<td>Special Character</td>
<td>Enable or Disable. Password can contain special characters only from this set &quot;!={[,.;~}},@#^</td>
</tr>
<tr>
<td>Minimum Password Length</td>
<td>Passwords must have at least 6 characters. The length is set to 8 by default.</td>
</tr>
<tr>
<td>Maximum Password Length</td>
<td>Password length can extend up to 128 characters. The length is set to 32 by default.</td>
</tr>
<tr>
<td>Number of Failed Attempts</td>
<td>Failed password attempts are limited from 1 to 16. The number of attempts is set to 5 by default.</td>
</tr>
<tr>
<td>Auto-Lock Time</td>
<td>0-3600 seconds. You can set the time for password auto-lock.</td>
</tr>
<tr>
<td>Enforce Passcode History (Last 4 passwords)</td>
<td>Enable or Disable</td>
</tr>
</tbody>
</table>

4. Click Apply.
5. Click **Yes** to confirm the change.
6. Click **OK** to save the password policy configuration.

## Certificate Management

Use the Certificate Management feature in the Sentry System Manager in **Security > Certificate Mgmt** to manage the certificate required for browsers to access the Standalone Sentry System Manager.

You can perform the following tasks from the Certificate Management screen:

- Generate a self-signed certificate
- Generate a certificate signing request (CSR) for a certificate authority (CA)
- Upload a certificate.

**NOTE:** When you update a certificate, you are prompted to confirm that you want to proceed because the HTTP service needs to be restarted, resulting in service disruption.

### Generating a self-signed certificate for the Standalone Sentry portal

If you use a self-signed certificate, a browser that is connecting to the Sentry System Manager is warned that the Sentry certificate is not from a trusted source. Therefore, MobileIron recommends that you use a certificate from a trusted Certificate Authority (CA).

To generate a self-signed certificate, in the Sentry System Manager go to **Security > Certificate Mgmt**.

**Procedure**

1. Click the **Manage Certificate** link for **Portal HTTPS**.
2. For **Certificate Options**, select **Generate Self-Signed Certificate** from the dropdown list.

**Figure 19. Generate self-signed certificate**

3. Click the **Generate Self Signed Certificate** button.
Generating a certificate signing request (CSR)

To get a certificate from a trusted Certificate Authority (CA), use the Security > Certificate Mgmt page to generate a certificate signing request (CSR) to the CA. Once you receive the signed certificate, you can use the same page to upload it to Sentry.

Procedure
1. Click the Manage Certificate link for Portal HTTPS.
2. For Certificate Options, select Generate CSR from the dropdown list.
3. Use the following guidelines to complete the displayed form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common Name</td>
<td>Enter the server host name.</td>
</tr>
<tr>
<td>E-Mail</td>
<td>Enter the email address of the contact person in your organization who should receive the resulting certificate.</td>
</tr>
<tr>
<td>Company</td>
<td>Enter the name of the company requesting the certificate.</td>
</tr>
<tr>
<td>Department</td>
<td>Enter the department requesting the certificate.</td>
</tr>
<tr>
<td>City</td>
<td>Enter the city in which the company is located.</td>
</tr>
<tr>
<td>State</td>
<td>Enter the state in which the company is located.</td>
</tr>
<tr>
<td>Country</td>
<td>Enter the two-character abbreviation for the country in which the company is located.</td>
</tr>
<tr>
<td>Key Length</td>
<td>Select 2048 or 3072 to specify the length of each key in the pair. Longer keys provide stronger security, but may impact performance.</td>
</tr>
</tbody>
</table>

4. Click Generate.
   A message similar to the following displays.
5. Copy the content between BEGIN RSA PRIVATE KEY and END RSA PRIVATE KEY to another text file.
6. Click Close.
7. Submit the file you created in step Certificate Management to the certifying authority.

Uploading certificates

To upload the CA certificate from the certifying authority in the Standalone Sentry System Manager go to Security > Certificate Mgmt.

Procedure
1. Click the Manage Certificate link for Portal HTTPS.
2. For Certificate Options, select Upload Certificate.
3. Select the certificates as indicated in the following table:

<table>
<thead>
<tr>
<th>Certificate</th>
<th>File to Select</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key file</td>
<td>The file created in Generating a certificate signing request (CSR).</td>
</tr>
<tr>
<td>Server certificate</td>
<td>The CA certificate file you received from the certifying authority.</td>
</tr>
<tr>
<td>CA certificate</td>
<td>The generic CA certificate file.</td>
</tr>
</tbody>
</table>

4. Click the Upload Certificate button.

Viewing certificates

To view a certificate, in the Standalone Sentry System Manager go to Security > Certificate Mgmt and click the View Certificate link for Portal HTTPS.
Access Control Lists

Use the Access Control Lists screen in the Standalone Sentry System Manager in Security > Access Control Lists to compile and manage the rules that define inbound and outbound access for network hosts and services.

Each access control list (ACL) consists of one or more access control entries (ACEs). Configuring ACLs requires the following tasks:
1. Configure entries for each network and host requiring an ACL.
2. Configure entries for any network services requiring an ACL.
3. Create an ACL.

Adding an ACL

To configure an access control list in the Standalone Sentry System Manager, go to Security > Access Control Lists.

Procedure
1. In the Standalone Sentry System Manager, go to Security > Access Control Lists.
2. Click Add.
3. In the Name field, enter a name to identify the ACL.
4. In the Description field, enter text to clarify the purpose of the ACL.
5. Click Save.
   The lower portion of the screen is now enabled.
6. **Click Add** to add an access control entry (ACE) to the ACL. Each ACE consists of a combination of the network hosts and services you configured for use in ACLs.

7. Use the following guidelines to complete the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Network</td>
<td>Select the network from which access will originate. This list is populated with the networks and hosts you created for use with ACLs. See “Networks and Hosts” on Networks and Hosts.</td>
</tr>
<tr>
<td>Destination Network</td>
<td>Select the network being accessed. This list is populated with the networks and hosts you created for use with ACLs. See “Networks and Hosts” on Networks and Hosts.</td>
</tr>
<tr>
<td>Service</td>
<td>Select the network service to which this entry permits or denies access. This list is populated with the services you created for use with ACLs. See “Network Services” on Network Services.</td>
</tr>
<tr>
<td>Action</td>
<td>Select Permit or Deny from the dropdown list.</td>
</tr>
<tr>
<td>Connections Per Minute</td>
<td>Enter the number of connections to allow per minute.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter text to describe the purpose of this entry.</td>
</tr>
</tbody>
</table>

8. **Click Save.**

**Editing an ACL**

To edit an access control list in the Standalone Sentry System Manager, go to **Security > Access Control Lists.**

**Procedure**

1. In the Standalone Sentry System Manager, go to **Security > Access Control Lists.**
2. Click the name in the ACLs list.
3. To delete an ACE, click its checkbox and click **Delete**.
4. To add an ACE, click **Add**.
5. To insert an ACE, select the ACE above which you want to insert a new ACE and click **Insert**.
6. Click **Save**.

**Copying an ACL**

To create a copy of an existing ACL in Standalone Sentry, go to **Security > Access Control Lists**.

**Procedure**
1. In the Standalone Sentry System Manager, go to **Security > Access Control Lists**.
2. Select the ACL to be copied.
3. Click the **Copy** button.
4. Enter a name for the new ACL.
5. Click **OK**.

**Deleting an ACL**

To delete an existing ACL in Standalone Sentry, go to **Security > Access Control Lists**.

**Procedure**
1. In the Standalone Sentry System Manager, go to **Security > Access Control Lists**.
2. Select the ACL to be deleted.
3. Click **Delete**.

**Networks and Hosts**

Use the Networks and Hosts screen to manage the servers and subnets you will use to compile Access Control Lists (ACLs).
Adding a host or subnet for compiling ACLs

To add a host or subnet for compiling ACLs in the Standalone Sentry System Manager, go to Security > Access Control Lists > Network & Hosts.

Procedure
1. Click Add.

2. Use the following guidelines for completing the displayed form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to use to identify this host or network.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter additional text to provide supporting information about this host or network.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Subnet or Host from the dropdown menu.</td>
</tr>
<tr>
<td>Network/Host</td>
<td>Enter the IP address for this network or host.</td>
</tr>
</tbody>
</table>

3. Click Save.
   This host or network will now be available for ACLs configured in the ACLs screen.
Network Services

Use the Network Services screen to manage available services. MobileIron prepopulates this screen with common services.

**Figure 25. Network services for ACL**

Adding a network service

To add a network service for compiling ACLs in the Standalone Sentry System Manager, go to Security > Access Control Lists > Network Services.

**Procedure**

1. Click Add.

**Figure 26. Add network service**

2. Use the following guidelines to complete the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to use to identify this service.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter additional text provide supporting information about this service.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Select TCP, UDP, or IP from the dropdown menu.</td>
</tr>
<tr>
<td>Source Port</td>
<td>Enter the number of the source port for this service. Enter 0 to allow any source port.</td>
</tr>
<tr>
<td>Destination Port</td>
<td>Enter the number of the destination port for this service. Enter 0 to allow any destination port.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

**Access Control Lists: ACLs**

See "Access Control Lists" on Access Control Lists.
Standalone Sentry Maintenance Settings

The following describe the maintenance settings in the Standalone Sentry System Manager:

- Overview of Sentry maintenance features
- Updating Standalone Sentry software
- Exporting the configuration
- Importing a configuration
- Clearing the configuration
- Rebooting

Overview of Sentry maintenance features

The **Maintenance** tab in the Standalone Sentry System Manager provides basic maintenance features for Standalone Sentry appliance. The following table summarizes these features.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software Updates</td>
<td>Upgrade Standalone Sentry software.</td>
</tr>
<tr>
<td>Export Configuration</td>
<td>Save the system configuration file.</td>
</tr>
<tr>
<td>Import Configuration</td>
<td>Import a saved system configuration file.</td>
</tr>
<tr>
<td>Clear Configuration</td>
<td>Clear the current system settings.</td>
</tr>
<tr>
<td>Reboot</td>
<td>Restart the Standalone Sentry.</td>
</tr>
</tbody>
</table>

### TABLE 34. CONFIGURATION LINKS IN THE MAINTENANCE TAB

**Updating Standalone Sentry software**

**NOTE:** If you are upgrading using a URL and not using the **Default** setting, use the CLI upgrade method. See Upgrading using CLI.

**Before you begin**

See the *MobileIron Standalone Sentry Release and Upgrade Notes* for release specific information.

**Procedure**

1. In Sentry System Manager, go to **Maintenance > Software Updates**.
2. **Software Version**: Check the Standalone Sentry version.
3. Set up the Software Repository Configuration.
   a. Enter the credentials assigned by MobileIron Support.
   b. For URL, Default is selected.
   c. Click Apply.
   d. Click OK to dismiss the success popup.
4. (Optional) If you are using a proxy server to support.mobileiron.com, set up Software Repository Proxy Configuration.
   a. Hostname/IP: Enter the proxy server hostname or IP address.
   b. Port: Enter the port number on the proxy server for Sentry.
   c. (optional) If needed, enter the credentials for the proxy server.
   d. Click Apply.
   e. Click OK to dismiss the success popup.
5. Click Check Updates.
   The available updates are listed.
6. Click Download Now if you want to download the update now and complete the installation at a later time.
7. Refresh the screen and click Check Updates.
   After the download is complete, the status for the update changes to Downloaded.
8. Click Stage for Install when you are ready to install.
   If you had already downloaded the selected update, the system stages the update for installation.
   If you did not previously download the selected update, it is downloaded and staged for installation.
   After the software update has been staged for installation, the status for the update changes to Reboot to Install. You can now install the update by rebooting the system. If the status of an update is not Reboot to Install, rebooting the system will not install the update.
9. Click Reboot in the left navigation pane to install the software update.

Verifying that the upgrade is complete

The following allow you to verify that the Standalone Sentry update is complete.

Procedure
1. In Standalone Sentry System Manager, go to Maintenance > Software Updates.
   Confirm that the version displayed is the current version.
2. In Standalone Sentry System Manager, go to Troubleshooting > Service Diagnosis.
   Confirm that status for the services listed shows Success.
3. Enroll a test device and validate email flow by sending and receiving email on the device.

Software update status

The following tables describes the status shown for each software upgrade:
Table 35. Software Upgrade Status

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Downloaded</td>
<td>The update is not yet downloaded. <strong>Next Step:</strong> Click <strong>Download Now</strong> or <strong>Stage for Install</strong> to download the update.</td>
</tr>
<tr>
<td>Download in progress</td>
<td>The download is in progress. Refresh the browser to update the status. <strong>Next Step:</strong> Click <strong>Stage for Install</strong> to stage the update for installation. The software update must be staged before installing.</td>
</tr>
<tr>
<td>Downloaded</td>
<td>The software update has been downloaded. <strong>Next Step:</strong> Click <strong>Stage for Install</strong> to stage the update for installation. The software update must be staged before installing.</td>
</tr>
<tr>
<td>Reboot to install</td>
<td>The software update was successfully downloaded and update is staged for the installation. <strong>Next Step:</strong> Click <strong>Reboot</strong> in the left navigation pane to install the software update.</td>
</tr>
</tbody>
</table>

Exporting the configuration

To back up the system configuration, you can export the Standalone Sentry configuration settings to XML format.

**Procedure**
1. Select **Export Configuration**.

![FIGURE 27. EXPORT CONFIGURATION](image)

2. Click **Export**.

Importing a configuration

You can import a Standalone Sentry configuration from a local XML file or FTP site.

**Procedure**
1. In the Standalone Sentry system manager, go to **Maintenance**.
2. Select **Import Configuration**.
3. Click **Browse** to select an import file.
4. Click **Import**.

### Clearing the configuration

**Clear Configuration** allows you to clear unsaved configuration settings and return to the default configuration.

**Procedure**

1. In the Standalone Sentry system manager, go to **Maintenance**.
2. Click **Clear Configuration**.

### Rebooting

You can reboot the Standalone Sentry to clear the current configuration settings and restart all server modules.

**Procedure**

1. In the Standalone Sentry system manager, go to **Maintenance**.
2. Select **Reboot** in the navigation pane.
3. Click the **Reboot** button.
Troubleshooting

The following describe the troubleshooting settings in the Standalone Sentry System Manager:

Overview of the Standalone Sentry Troubleshooting tab
Logs
Network Monitor
Service Diagnosis
Sentry Statistics

Overview of the Standalone Sentry Troubleshooting tab

Use the Troubleshooting tab to investigate possible problems with Standalone Sentry operation. In most cases, you will use this tab under the direction of MobileIron Customer Support.

Table 36. Configuration Links in the Troubleshooting Tab

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logs</td>
<td>Configure and upload log files.</td>
</tr>
<tr>
<td>Network Monitor</td>
<td>Produce a TCP dump for Sentry.</td>
</tr>
<tr>
<td>Service Diagnosis</td>
<td>Check the health of related servers.</td>
</tr>
<tr>
<td>Sentry Statistics</td>
<td>Produce an operational report.</td>
</tr>
</tbody>
</table>

Logs

The Logs page allows you to the following:
- Log management
- View module logs
- Export logs

Log management

You can enable or disable logging and control the details collected in Sentry logs for the following services:
- MICS (MobileIron Configuration Service)
- Sentry

For the Sentry service, you can do the following:
• Specify whether to exclude interactions between Sentry and the device or between Sentry and the backend resource.
• Specify levels of increasing detail.
• Filter logs based on specific attributes, such as Device ID.

**Figure 31. Troubleshooting**

The following table describes the options for managing logs.

**Table 37. Options for Managing Logs**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MICS</td>
<td>Includes messages related to the MobileIron Configuration System module that supports the Sentry.</td>
</tr>
<tr>
<td>Sentry</td>
<td>Includes messages related to Sentry operation.</td>
</tr>
<tr>
<td>To/From Device</td>
<td>Includes messages related to interactions between Sentry and the registered ActiveSync devices.</td>
</tr>
<tr>
<td>To/From ActiveSync Server</td>
<td>Includes messages related to interactions between Sentry the configured ActiveSync servers.</td>
</tr>
<tr>
<td>Level 1</td>
<td>Includes HTTP response/request lines and a few supporting operational messages. This level of provides the least detailed logging.</td>
</tr>
<tr>
<td>Level 2</td>
<td>Includes Level 1 content, HTTP headers, and additional operational messages.</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Sufficient when network issues are suspected. Primarily used for troubleshooting AppTunnel issues.</td>
</tr>
</tbody>
</table>
| Level 3 | Includes Level 1 and Level 2 content and the information associated with the messages.  
Enabled when you know that there are no network issues, but there may be an issue with ActiveSync.  
This is the most common level requested by MobileIron support. The logs contain WBXML.  
Log data includes email, calendar, and contact information. |
| Level 4 | Includes all available log data.  
Enabled if parsing errors or missing data is suspected. Enable, only when requested by MobileIron Support.  
Log data includes email, calendar, and contact information |

**Related topics**
- Turning logging on or off
- Filtering log entries
- Disabling filters
- Deleting filters
- Viewing logs

**Turning logging on or off**

You can turn logging on or off by either selecting or deselecting the MICS or Sentry options under Log Management.

**Procedure**
1. Select or deselect the MICS checkbox to turn on or off MICS logging.
2. Select or deselect the Sentry checkbox to turn on or off Sentry logging.
3. If you turn on Sentry logging, select log options, level, and filters.
4. Click **Apply**.

**Filtering log entries**

The Filtering section of the Log Management screen enables you to isolate entries based on the following attributes:
- device-id—filters the logs based on the device id
- device-ip—filters the logs based on a specific ip address
- user-id—filters the logs based on a specific user id
  User id must be an exact match, but it is case insensitive.
The following example shows how to restrict the display to entries containing user ID johnd.

**FIGURE 32. FILTER LOG ENTRIES**

If multiple filters are specified, Sentry performs a logical OR operation; Sentry selects the log lines matching at least one of the filters.

**Procedure**
1. Select the **Enable Filters** checkbox.
2. Click the green + button to display a filter entry.
3. Select an attribute from the **Attribute** drop-down list.
4. In the **Value** field, enter the value you want to match. The field is free-form and case-sensitive.
5. In the **Tag Name** field, enter a string that identifies the filter. The tag name is added to the log output. Tag names are especially useful when you apply multiple filters. Adding a tag name is optional.
6. Click **Apply**.

**Disabling filters**

Disabling a filter removes the effect of the filter. Select the **Disable** checkbox to disable the filter. Clear it to re-enable the filter.

**Deleting filters**

If you do not intend to reuse a filter, you can delete it. To delete a filter, click the red – button.

**View logs**

The Troubleshooting > Logs page enables you to view the contents of logs directly from the console. Logging must be turned on.
### TABLE 38. DESCRIPTION OF AVAILABLE LOGS

<table>
<thead>
<tr>
<th>Log Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MICS</td>
<td>MobileIron Configuration Service log entries. Sentry System Manager logs include IP, DNS, debugging, and upgrade configuration.</td>
</tr>
<tr>
<td>Sentry</td>
<td>Sentry operation log entries</td>
</tr>
<tr>
<td>System</td>
<td>Sentry status log entries</td>
</tr>
<tr>
<td>Syslog</td>
<td>A superset of the information in the MICS log. Includes Sentry system level information and WARN and above application logs.</td>
</tr>
<tr>
<td>Catalina</td>
<td>MobileIron application loading status. Includes the Sentry application server (tomcat) console logs.</td>
</tr>
<tr>
<td>Catalina2</td>
<td>MobileIron application loading status. Includes the Sentry System Manager (MICS) application server (tomcat2) console logs.</td>
</tr>
</tbody>
</table>

### Viewing logs

The **View Module Logs** section in the **Troubleshooting > Logs** page contains links to logs for Sentry modules.

#### Procedure

1. In the View Module Logs section, click the link for the log you want to view.

#### Figure 33. LOG VIEW

![Log View](image)

The displayed window shows the most recent log entries. The window scrolls dynamically as the MobileIron Server adds entries to the log.

2. Click x to close the log view window.

**NOTE:** If you close the log view window and then re-open it, the displayed window shows only log entries made since you closed the window.

To remove existing log entries from the log view window and view only new log entries, click the **Clear Window** button.
Exporting logs

The Export Logs section allows you to download logs.

Downloading logs

The following procedure describes how to download Sentry logs. Logs are downloaded to your local drive.

Procedure
1. Go to Troubleshooting > Logs.
2. Scroll down to the Export Logs section.
3. In the Export Logs section, select Download from the Type drop-down list.
4. If you have received a MobileIron support ticket number associated with this upload, enter it in the Support Ticket Number field.
5. Click Download.

Network Monitor

The Network Monitor page enables you to produce a TCP dump for a Standalone Sentry physical interface. The information provided might assist in troubleshooting device connectivity problems. Click Download to store the results in a pcap file.

Use the following guidelines to complete this screen:
### TABLE 39. NETWORK MONITOR FIELD DESCRIPTIONS

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Select the physical interface for which you want to produce a TCP dump. If you have configured multiple interfaces, select <strong>All</strong> to get a TCP dump for all physical interfaces at one time.</td>
</tr>
<tr>
<td>Filter</td>
<td>not implemented.</td>
</tr>
<tr>
<td>Max. packet size</td>
<td>not implemented.</td>
</tr>
<tr>
<td>Max no. of Packets</td>
<td>not implemented.</td>
</tr>
<tr>
<td>Start</td>
<td>Click to start TCP dump. TIP: A growing file size indicates that the TCP dump is running.</td>
</tr>
<tr>
<td>Stop</td>
<td>Click to stop TCP dump. TIP: Click stop after reproducing the issue.</td>
</tr>
<tr>
<td>Download</td>
<td>Click to download TCP dump. If you click <strong>Download</strong> before starting the TCP dump you may not have any data to download. After starting a TCP dump, you may choose to download later after reproducing the issue. TIP: A growing file size indicates that the TCP dump is running.</td>
</tr>
</tbody>
</table>

### Service Diagnosis

You can use the **Service Diagnosis** page under **Troubleshooting** to check the health of the following services:

- EAS
- NTP
- DNS
- EMM (MobileIron Core or Mobileiron Cloud)
Click **Verify All** to recheck the listed services, or click **Verify** next to a specific service to verify just that service.

Clicking **Verify** next to the EMM (MobileIron Core or MobileIron Cloud) entry causes Standalone Sentry to make another attempt to contact the MobileIron EMM server. The resulting **Message** field of the EMM entry indicates whether the server is reachable.

Some reasons that the EMM may not be reachable include:
- Network errors.
- Actions taken by MobileIron Technical Support for troubleshooting.

### ActiveSync server status

You can check the ActiveSync server status by doing one of the following:
- In the Admin Portal, go to **Settings > Service Diagnostic**.
- In the Standalone Sentry System Manager, go to **Troubleshooting > Service Diagnosis**.

### Sentry Statistics

You can download statistics for Sentry operation. These statistics encompass the entire Sentry implementation and all connecting devices. They are most useful for charting true activity peaks so that you can schedule maintenance appropriately. Also, MobileIron technical support can use these statistics for troubleshooting issues.

When Sentry Statistics is enabled or when Start is selected, the settings persists across Sentry restart. The settings in Sentry Statistics are saved as the following properties in `/mi/alcor/config/v2/local/alcor-local.properties`:

```
alcor.local.config.enable.sentry.global.statistics.report=true
alcor.local.config.statistics.log.interval.min=5
```

Sentry statistics collection is a continuous process. If Sentry statistics is started, the statistics are written to `global-stats.csv`. When Standalone Sentry restarts, the data is archived.

Use this page for the following:
Download Sentry Statistics

Click the Download button to download a ZIP file containing the global statistics and device statistics for the Sentry. The ZIP file contains two CSV files:

- global-stats.csv
  Provides overall Sentry statistics, useful for charting peak activity and for troubleshooting.
- all-device-stats.csv
  Provides statistics for each device, useful for troubleshooting issues on a specific device.

Change Statistics collection

You can make the following changes to Sentry Statistics collection:

- start
- stop
- reset
- change the interval
TABLE 40. STATISTICS COLLECTION OPTIONS

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>Select to start Sentry statistics collection. When the Sentry Statistics view shows <strong>Start</strong> as selected, statistics collection is written to global-stats.csv. This setting is not persistent. When Standalone Sentry restarts, the setting defaults to <strong>Stop</strong>. Statistics in global-stats.csv are archived.</td>
</tr>
<tr>
<td>Stop</td>
<td>Select to turn off Sentry statistics collection. When the Sentry Statistics view shows <strong>Stop</strong> as selected, statistics collection is no longer written to global-stats.csv.</td>
</tr>
<tr>
<td>Apply &amp; Reset Statistics</td>
<td>Click to clear the existing statistics file and restart statistics collection.</td>
</tr>
</tbody>
</table>

**Changing the log interval**

Sentry statistics are recorded to global-stats.csv every 5 minutes by default when statistics collection is enabled. You can change the statistics collection interval.

**Procedure**

1. Delete the current interval from the **Log Interval** field.
2. Enter a new interval.
3. Click **Apply**.

**NOTE:** Changes to Snapshot Interval are persistent after a Standalone Sentry restart.

**Sentry Utilization**

To view the latest Sentry resource utilization information, click **Refresh**.

There is up to a one minute lag in updating the information.

**System utilization alerts**

The Standalone Sentry monitors system utilization at 30 minute intervals. An alert is raised if utilization exceeds the default threshold level.

If you configured a syslog server in the Sentry System Manager, these alerts can be made available on the syslog server.

Alerts are generated for the following parameters
### Table 41. System Utilization Alert Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thread Pool Utilization</td>
<td>80%</td>
</tr>
<tr>
<td>CPU Utilization</td>
<td>70%</td>
</tr>
<tr>
<td>System Memory Utilization</td>
<td>70%</td>
</tr>
</tbody>
</table>
Monitoring

The following describe the monitoring settings in the Standalone Sentry System Manager:

Overview of the Standalone Sentry Monitoring tab
Alert Viewer
Alert Configuration

Overview of the Standalone Sentry Monitoring tab

Use the Monitoring tab to view email and AppTunnel alerts. The alerts include, HTTP (email and apps), Kerberos, and ActiveSync status errors. Alerts that are warning and above are shown.

<table>
<thead>
<tr>
<th>Alerts Viewer</th>
<th>View alerts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert Configuration</td>
<td>Configure notifications</td>
</tr>
</tbody>
</table>

Alert Viewer

Use this page to view Sentry alerts. Sentry reports multiple types of alerts. Each alert has its own alert ID, and each alert ID is linked to an article in the MobileIron Knowledge Base if one is available. The Knowledge Base article gives more information on the alert and the related error codes. For ActiveSync traffic, separate alert IDs are provided and each alert ID for ActiveSync traffic corresponds to an ActiveSync command, such as Sync, Ping, or Sendmail, supported by Standalone Sentry.

Note the Following:
- Set the logging level at 3 or more (Sentry System Manager > Troubleshooting > Logs). The Monitoring tab will not show any alerts if logging level is 2 or less.
- The page is not automatically refreshed. Reload the page to refresh the alerts.
- Alerts for ping status 2 are also seen. Ping status 2 is not an error.
- After Standalone Sentry is restarted, only the most recent 1000 lines will be displayed.

Filtering Standalone Sentry alerts

Filtering allows you to narrow down the alerts to a specified set. The filter is applied only to the alerts displayed in the Alert Viewer page.
Procedure

1. In the Standalone Sentry System Manager, go to Monitoring > Alert Viewer.

   ![Alert Viewer Screen](image1)

2. Enter a text string in the text box.
   Regular expressions are supported. Case is ignored. Example: Error and ERROR will return the same results.

3. Click Filter.
   Only alerts containing the text string are displayed.
   Click Clear to clear the filter and return the complete set of alerts.
   Click Reload to return an updated set of alerts based on the current filter settings. Reload does not clear the filter. Refreshing the browser will clear the filter.

Alert Configuration

Use this page to configure notifications for Standalone Sentry alerts, such as email address to which notifications are sent.

![Alert Configuration Screen](image2)
Configuring Sentry alert notifications

Sentry alert notification is configured in the Standalone Sentry System Manager in Monitoring > Alert Configuration.

Procedure
1. In the Sentry System Manager go to Monitoring > Alert Configuration.
2. Use the guidelines in the table to configure notifications.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notifications</td>
<td>Select the checkbox to enable alert notifications.</td>
</tr>
<tr>
<td>Email List</td>
<td>Enter the email address to send the alerts. Enter multiple email addresses as a comma separated list.</td>
</tr>
<tr>
<td>Alerts Per Hour</td>
<td>Enter a number. This is the number of alerts in an hour that can be emailed to you. For example, if you enter the number 1, you will get one alert once every hour. If there are more than one alerts for that hour, only the first alert is emailed to you. Subsequent alerts within the hour are not emailed. The clock is reset at the top of each hour.</td>
</tr>
<tr>
<td>Batch Time Interval</td>
<td>Enter a number. Batch notifications are emailed at the interval set in this field.</td>
</tr>
<tr>
<td>Default</td>
<td>Select the default action for email alert notification. The default action is applied to alerts that do not have a specific email notification action configured.</td>
</tr>
</tbody>
</table>

**Discard**: An email notification is not sent for the alerts.

**Realtime Notification**: Email notification is sent immediately after the alert. Apply this action to alerts that require immediate attention.

**Batch Notification**: Alerts are combined into a single email notification. Use batch notification for non-critical alerts.

3. Click Apply.

NOTE: You must also configure Email Settings in the Sentry System Manager to receive alert notifications by email.

Managing alert notification

Configure a notification action to a Standalone Sentry alert in Monitoring > Alert Notifications in the Standalone Sentry system manager.
Procedure

1. In the **Alert Notification Management** section, click **Add**.
2. In the **Add Alert ID** pop up, enter an **Alert ID**.
3. From the drop down List, select a notification action.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discard</td>
<td>A notification is not sent for the alert.</td>
</tr>
<tr>
<td>Realtime Notification</td>
<td>Alert notification is sent in real time. Apply this action to alerts that require immediate attention.</td>
</tr>
<tr>
<td>Batch Notification</td>
<td>The Alert is batched into a single notification. Apply this action to non-critical, but important alerts.</td>
</tr>
</tbody>
</table>

4. Click **Apply**.
Command Line Interface

The Standalone Sentry command line reference provides commands to configure many features that are also available in the Standalone Sentry System Manager user interface.

Standalone Sentry CLI also includes commands that are specific to a MobileIron unified enterprise management (UEM) platform. The MobileIron UEM platforms are:

- MobileIron Core
- MobileIron Cloud

If you execute a UEM platform-specific CLI command in a deployment that does not use that UEM platform, an error message displays.

Example:

```plaintext
config# debug sentry check-in
This command is not applicable for the EMM Server
config#
```

The following CLI commands are specific to Standalone Sentry:

- Purging the cache
- Logging
- Configuring garbage collection (GC)
- Monitoring Sentry
- Configuring a syslog server
- Reporting
- Clearing the redirect URL
- Configuring access to MobileIron UEM
- Enabling and disabling iptables
- curl
- Regenerating the Standalone Sentry self-signed certificate
- Checking Kerberos Key Distribution Center (KDC) connectivity
- Verifying Kerberos configuration
- Initializing Kerberos
- Stopping and restarting Standalone Sentry services
- Configuring kernel parameters
- Using the Splunk forwarder service
- Changing TLS protocols
- Checking TLS compliance
- Enabling and disabling SSL HSTS
- Upgrading using CLI
- Configuring a proxy server for upgrades
- Upgrading multiple Sentry
- Viewing auto-upgrade details
Purging the cache

MobileIron does not recommend purging the cache unless required for debugging purposes. These commands are accessible from CONFIG mode.

The purge features available through the CLI are described below:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purge the device cache</td>
<td>debug sentry device-cache purge all</td>
</tr>
<tr>
<td>Purge the device cache of a specific device</td>
<td>debug sentry device-cache purge entry &lt;device-id&gt; &lt;user-id&gt;</td>
</tr>
<tr>
<td>Purge the Kerberos cache</td>
<td>debug sentry kerberos-cache purge &lt;upn-string&gt;</td>
</tr>
</tbody>
</table>

- **To purge the device cache**, enter the following command:
  debug sentry device-cache purge all
  Example of purging the device cache:
  ```
  config# debug sentry device-cache purge all
  ```

- **To purge the device cache of a specific device**, enter the following command:
  debug sentry device-cache purge entry <device-id> <user-id>
  - device-id
    The id of the device for which you want information.
  - user-id
    The User associated with the device.
  Example:
  ```
  config# debug sentry device-cache purge entry Appl7S032TF7A4S testuser2674
  ```

- **To purge the Kerberos cache for a specific UPN**, enter the following command:
  debug sentry kerberos-cache purge <upn-string>
  - upn-string
    The UPN of the Kerberos user for which you want to purge the cached information.
  Example of purging the cache for a Kerberos user:
  ```
  config# debug sentry kerberos-cache purge user@ironmobile.com
  Purged 1 entries from cache
  ```

Purging CRL cache

You can purge CRL cache entry by using CRL ID:

```
/usr/bin/curl -XPOST http://localhost:<port>/asproxy/crl-cache?action=purge&crl-id=<crl_id>
```
Logging

The logging commands are accessible from CONFIG mode. Log configuration is not persistent after a reboot.

The logging features available through the CLI are described below:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Sentry logging</td>
<td>debug sentry log enable {device</td>
</tr>
<tr>
<td>Specify filters</td>
<td>debug sentry log filter &lt;tag&gt; {device-id</td>
</tr>
<tr>
<td>Specify verbosity</td>
<td>debug sentry log verbosity {level_1</td>
</tr>
<tr>
<td>Disable Sentry logging</td>
<td>no debug sentry log</td>
</tr>
<tr>
<td>Delete log filters</td>
<td>no debug sentry log filter &lt;tag&gt;</td>
</tr>
<tr>
<td>Disable initialization log</td>
<td>no debug sentry init-log</td>
</tr>
<tr>
<td>messages</td>
<td></td>
</tr>
<tr>
<td>Enable initialization log</td>
<td>debug sentry init-log {level_1</td>
</tr>
<tr>
<td>messages</td>
<td></td>
</tr>
</tbody>
</table>

- **To enable Sentry logging**, enter config mode and type the following command:
  
debug sentry log enable {device | server | both}
  
  - device
    Optional. Logging is enabled to and from devices.
  - server
    Optional. Logging is enabled to and from the ActiveSync Server.
  - both
    Optional. Logging is enabled to and from both devices and the ActiveSync Server. This value is the default if no parameter is specified.
  
  Example of enabling logging to and from devices:
  
  config# debug sentry log enable device
  Successful

- **To create a filter**, enter the following command after logging is enabled:
  
debug sentry log filter <tag> {device-id | device-ip | user-id | bundle-id | service-name | config-uuid} <value>
  
  - tag
    The tag name that you are assigning to the filter
  - device-id | device-ip | user-id | bundle-id | service-name | config-uuid
    The attribute—device id, device ip, or user id—that corresponds to this filter
  - value
    Specify the value of the attribute
  
  Example of creating a filter for a specific user:
  
  config# debug sentry log filter KensDevice user-id ksmith
  Successful
You can verify that the filter was created by using the following command, in EXEC mode, to view a list of filters:

```
config# end
#show sentry log filter
TAG ENABLED TYPE VALUE
KensDevice true user-id ksmith
```

- **To set the log detail level**, enter the following command after logging is enabled:
  ```
default]
  level_1|lowest
  level_2|lowest
  level_3|lowest
  level_4|highest

- level_1|lowest
  Includes HTTP response/request lines and a few supporting operational messages. level_1|lowest is the default setting.
- level_2
  Includes Level 1 content, HTTP headers, and additional operational messages.
- level_3
  Includes Level 1 and Level 2 content and the information associated with the messages.
- level_4|highest
  Includes all available log data.

Example of setting the log detail level:
```
config# default]
level_1|lowest
```

- **To disable Sentry logging**, enter the following command:
  ```
default]
  no default]
```

Example of disabling the Sentry logging:
```
config# no debug sentry log
```

- **To delete Sentry log filters**, enter the following command:
  ```
default]
  no default]
```

Example of deleting filters using the CLI:
```
config# no debug sentry log filter KensPhone
```

- **To disable log messages during Standalone Sentry initialization**, enter the following command:
  ```
default]
  no default]
```

Example of disabling log messages during Standalone Sentry initialization:
```
config# no debug sentry init-log
```

Restart tomcat service to take this effective.

- **To enable log messages during Standalone Sentry initialization**, enter the following command:
  ```
default]
  debug sentry init-log [level_1|lowest|level_2|level_3|level_4|highest]
```

To set log verbosity, enter one of the following options:
- level_1|lowest
  Includes HTTP response/request lines and a few supporting operational messages.
- level_2
  Includes Level 1 content, HTTP headers, and additional operational messages.
- level_3
  Includes Level 1 and Level 2 content and the information associated with the messages.
- level_4|highest
  Includes all available log data. level_4|highest is the default setting.
Example of setting the log detail level:
```
config# debug sentry init-log level 2
```
Restart tomcat service to make this effective.

## Configuring garbage collection (GC)

Garbage Collection (GC) logs are enabled by default. The GC logs are automatically added to show-tech.

### Table 45. Configuring Garbage Collection

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable GC logging and rotation</td>
<td><code>sentry gc-log [file-count] [file-size]</code></td>
</tr>
<tr>
<td></td>
<td><code>file-count</code>: The number of GC log files to use when rotating logs. Enter a number between 1 and 100. The default is 5.</td>
</tr>
<tr>
<td></td>
<td><code>file-size</code>: The size of GC log file at which point the log will be rotated. Enter a file size between 8K and 300M. The default is 20M.</td>
</tr>
<tr>
<td>Disable Sentry GC logging and rotation</td>
<td><code>no sentry gc-log</code></td>
</tr>
<tr>
<td></td>
<td>Requires a restart of Sentry services for changes to take effect.</td>
</tr>
</tbody>
</table>

## Monitoring Sentry

The CLI provide commands to monitor and capture additional information about Sentry server. These commands help debug issues in complex deployments. Enter these commands in CONFIG mode.

The monitoring features include enabling, disabling, port change for packet captures, duration of packet captures, monitoring threads percentage, and monitoring trigger time.

### Table 46. Monitoring Sentry

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Sentry Monitor</td>
<td><code>debug sentry monitor enable</code></td>
</tr>
<tr>
<td>Disable Sentry Monitor</td>
<td><code>no debug sentry monitor enable</code></td>
</tr>
<tr>
<td>Port change for packet captures</td>
<td><code>debug sentry monitor capture port [port_number]</code></td>
</tr>
<tr>
<td></td>
<td>If the port number is not provided, the default port 443 is used.</td>
</tr>
</tbody>
</table>
TABLE 46. MONITORING SENTRY (CONT.)

| Feature                                                       | Command                                           |
|                                                              |                                                   |
| Duration of packet captures performed during data collection | debug sentry monitor capture time [capture_time]  |
|                                                              | Capture time is measured in seconds. If capture_time is not provided, the default capture time of 600 seconds is used. |
| Sentry server is monitored for the number of running threads over the threshold | debug sentry monitor threads percentage [percentage]  |
|                                                              | If the percentage is not provided, the default value for percentage is 90. |
| Sentry monitoring triggers a Sentry restart after the configured time. | debug sentry monitor trigger [time_in_minutes]  |
|                                                              | If the time is not set, the default time of 600 seconds is used. |

Configuring a syslog server

Configuring a remote log server to send Sentry syslog data is a two step process and requires the following:

1. Adding a syslog server
2. Enabling log data

To view Sentry facility configuration see:

- Displaying syslog configuration

Adding a syslog server

To add or edit a syslog server, type the following command in CONFIG mode:

```
syslog <server> [port] <protocol> <facility> <log-level> [state]
```

To delete a syslog server, type the following command in CONFIG mode:

```
no syslog <server> [port]
```

TABLE 47. ADDING A SYSLOG SERVER

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>IP address or hostname of the syslog server.</td>
</tr>
<tr>
<td>port</td>
<td>Syslog server port. Use port 514 if you are adding MobileIron Monitor. If the port number is not provided, the default port 514 is used.</td>
</tr>
<tr>
<td>protocol</td>
<td>Protocol of the syslog server. The options are:</td>
</tr>
<tr>
<td></td>
<td>• UDP</td>
</tr>
<tr>
<td></td>
<td>• TCP</td>
</tr>
</tbody>
</table>
### Table 47. Adding a Syslog Server (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| facility  | Type of log messages sent to the syslog server. The options are:  
  • general  
  • health-monitor  
  • audit  

| log-level | Minimum severity level of log messages to be sent. The options are:  
  • emerg  
  • alert  
  • crit  
  • err  
  • warning  
  • notice  
  • info  
  • debug  
  
  CLI does not limit log-level by the facility choice. |
|-----------|-------------|
| state     | State of the syslog server. The options are:  
  • enable  
  • disable  
  
  If state is not specified, syslog is enabled by default. |

### Enabling log data

After adding a syslog server, you need to also enable the log data for the facility you selected for the syslog server. Sentry forwards the log data that is enabled to the syslog server. General log data is enabled by default. No additional action is required if you chose General facility when you added the syslog server.

To enable log data for the facility, enter the following command in CONFIG mode:

```
sentry {audit | health-monitor}
```

### Table 48. Enabling Log Data

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable sentry audit log data</td>
<td>sentry audit</td>
</tr>
<tr>
<td>Enable sentry health monitoring</td>
<td>sentry health-monitor</td>
</tr>
<tr>
<td>Disable sentry audit</td>
<td>no sentry audit</td>
</tr>
<tr>
<td>Disable sentry health monitoring</td>
<td>no sentry health-monitor</td>
</tr>
</tbody>
</table>
Displaying syslog configuration

To view syslog server facility configuration use the following commands in EXEC or PRIVILEGED mode:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display syslog configuration</td>
<td>show logging</td>
</tr>
<tr>
<td>Display sentry audit configuration</td>
<td>show sentry audit config</td>
</tr>
<tr>
<td>Display sentry health monitoring</td>
<td>show sentry health-monitor</td>
</tr>
</tbody>
</table>

**Example**

```shell
sentry# show logging
+-----------------+-----------------+-----------------+-----------------+-------------------+-------------------+
<table>
<thead>
<tr>
<th>Hostname / IP Address</th>
<th>Port</th>
<th>Protocol</th>
<th>Facility Type</th>
<th>Log Level</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>app1111.auto1.mycompany.com</td>
<td>514</td>
<td>UDP</td>
<td>health-monitor</td>
<td>info</td>
<td>enable</td>
</tr>
</tbody>
</table>
```

**Reporting**

The CLI provides commands to support the reporting features. The commands are accessible from exec mode.

The reporting features include configuration, cache reporting for systems and devices, statistics for systems and devices, and Kerberos-related reporting.

- Displaying Sentry configuration
- Displaying information for entries in the device cache
- Displaying information about Kerberos modules
- Displaying Sentry statistics
- Displaying information about servers
- Displaying Sentry system resources
- Displaying Sentry log configuration
- Displaying Sentry log filters

**Displaying Sentry configuration**

You can request a report of the entire configuration or filter by a string of text so that the output only displays rows matching the filter-string text.

To show the Sentry log configuration, enter the following command:

```shell
show sentry config-properties [filter-string]
```

- filter-string
  - Optional. Specify text to filter the output.

Example of a request for output of the Sentry log configuration for asproxy.client:

```shell
#show sentry config-properties asproxy.client
```
asproxy.client.port = 80
asproxy.client.tls.port = 443

If you do not specify a filter, the output includes all configuration information.

### Displaying information for entries in the device cache

You can display information for entries in the Sentry device cache. You can also display information about the in-memory device list, the persistent device list, and connectivity to MobileIron UEM.

**Caution:** The purpose of these commands is to assist MobileIron Technical Support with troubleshooting. Do not depend on the output’s format for use with any programs.

**Table 50. Displaying Information for Entries in the Device Cache**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display a list of entries in the Sentry device cache.</td>
<td>show sentry device-cache dump {all</td>
</tr>
<tr>
<td>Display detailed information for a specific entry.</td>
<td>show sentry device-cache entry &lt;tunnel-id&gt; &lt;user-id&gt;</td>
</tr>
<tr>
<td>Display the entries associated with a device id</td>
<td>show sentry device-cache device &lt;device-id&gt;</td>
</tr>
<tr>
<td>Display the entries associated with a user id</td>
<td>show sentry device-cache user &lt;user-id&gt;</td>
</tr>
<tr>
<td>Display the entries with the specified number of minimum connections</td>
<td>show sentry device-cache min-connection &lt;value&gt;</td>
</tr>
<tr>
<td>Show the entries that need validation from UEM.</td>
<td>show sentry device-cache validation-pending {yes</td>
</tr>
<tr>
<td>Show the status of the Sentry-device cache.</td>
<td>show sentry device-cache status</td>
</tr>
<tr>
<td>Show the connection status to UEM.</td>
<td>show sentry status</td>
</tr>
</tbody>
</table>

- **To display the entries in the device cache,** type the following command:
  
  ```
  show sentry device-cache dump {all | active-sync | app-tunnel}
  - all
  Displays all entries in the cache in table format.
  #show sentry device-cache dump all
  - active-sync
  Displays the ActiveSync entries in the cache in table format.
  #show sentry device-cache dump active-sync
  - app-tunnel
  Displays the app tunnel entries in the cache in table format.
  #show sentry device-cache dump app-tunnel
  ```

- **To display detailed information about a specific entry in the device cache,** type the following command:
show sentry device-cache entry <tunnel-id> <user-id>
  - tunnel-id
  The Tunnel ID of the entry in the device cache for which you want information. You can view the Tunnel-ID in
  the output from show sentry device-cache dump.
  - user-id
  The User ID associated with the entry.

- **To display all entries associated with a specific device,** type the following command:
  
  show sentry device-cache device <device-id>
  
  - device-id
    The device-id for which you want to display all entries.
    If you provide a partial device id, the rows for all matching devices are displayed.

  Example of a request for a report for a specific device-id:

  sentry# show sentry device-cache device 0V55EEVSRT5UVFA05AUBLF904S

  S: Tunnel State {A:Allowed, B:Blocked, P:Policy Pending, W:Wipe Pending}
  Vs: EMM Validation State {Y:validated, N:not-validated}
  Cn: Connection count
  Ver: AppTunnel Version or ActiveSync Version
  Time: Timestamp of the last request or connection
  Application[/ID]: Application[/ActiveSync Device ID (if application is 'ActiveSync')] Tunnel-ID: Generic Tunnel ID

  Index User S Vs Cn Ver Time Application[/ID] Tunnel-ID
  1 testuser3351 A Y 0 14.1 2015-08-27 18:30:57 GMT ActiveSync/0V55EEVSRT5UVFA05AUBLF904S
  0V55eevsrt5uvfa05aublf9o4s

  sentry#

- **To display all entries associated with a specific user,** type the following command:
  
  show sentry device-cache user <user-id>
  
  - user-id
    The user-id for which you want to display all entries.
    If you provide a partial userid, the rows for all matching users are displayed.

  Example of a request for a report for a specific user-id:

  sentry# show sentry device-cache user testuser3351

  S: Tunnel State {A:Allowed, B:Blocked, P:Policy Pending, W:Wipe Pending}
  Vs: EMM Validation State {Y:validated, N:not-validated}
  Cn: Connection count
  Ver: AppTunnel Version or ActiveSync Version
  Time: Timestamp of the last request or connection
  Application[/ID]: Application[/ActiveSync Device ID (if application is 'ActiveSync')] Tunnel-ID: Generic Tunnel ID

  Index User S Vs Cn Ver Time Application[/ID] Tunnel-ID
  1 testuser3351 A Y 0 14.1 2015-08-27 18:30:57 GMT ActiveSync/0V55EEVSRT5UVFA05AUBLF904S
  0V55eevsrt5uvfa05aublf9o4s

  sentry#

- **To display the entries with the specified minimum number of connections,** enter the following
  command:

  show sentry device-cache min-connection <value>

  - value
    The number of connections, at a minimum, for which you want to display the associated entries.

  Example of a request for a list of devices that have the minimum number of connections:

  #show sentry device-cache min-connection 1

- **To display the entries that require EMM validation,** enter the following command:

  show sentry device-cache validation-pending {yes | no}
Example of a request for a list of devices that require validation from MobileIron EMM:

```
#show sentry device-cache validation-pending yes
```

- **To display information about the persistent device list and the in-memory device list,** enter the following command:
  
  ```
  show sentry device-cache status
  ```

  Example of the command:

- **To display information about the Standalone Sentry's connection to the EMM server,** enter the following command:

  ```
  show sentry status
  ```

  Example of the command and its output:

  ```
  #show sentry status
  EMM server type : Core
  Connectivity to Core : Connected
  Last connectivity change detected by : Periodic connectivity check
  Last connectivity change time : Fri Aug 03 18:55:16 UTC 2012
  
  Core periodic connectivity check status
  Current time : Fri Aug 03 21:32:49 UTC 2012
  Last successful : Fri Aug 03 21:25:17 UTC 2012
  Last failed : Never
  Next scheduled : Fri Aug 03 21:40:17 UTC 2012
  
  EMM server fail-open status : Allow
  Last fail-open status change detected by : Sentry initialization
  Last fail-open status change time : Tue Aug 02 23:05:08 UTC 2012
  ```

  The Standalone Sentry detects changes to EMM connectivity in one of the following ways:
  - The Standalone Sentry checks EMM connectivity on a regular basis. This is known as the periodic connectivity check.
  - The Standalone Sentry checks EMM connectivity when the Sentry initializes.
  - The administrator can manually check EMM connectivity by using the Verify button on the Troubleshooting > Service Diagnosis page of the Standalone Sentry Web Portal.

### Displaying information about Kerberos modules

You can display the Kerberos and UPN information. The new CLI commands for Kerberos reporting are described below.

**Table 51. Displaying Information about Kerberos Modules**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display the SPN, timeout, and cache size for Kerberos</td>
<td><code>show sentry kerberos</code></td>
</tr>
<tr>
<td>Display Kerberos UPN information</td>
<td><code>show sentry kerberos cache dump [upn-filter]</code></td>
</tr>
<tr>
<td>Display Kerberos information related to a specific UPN</td>
<td><code>show sentry kerberos cache upn &lt;upn-string&gt;</code></td>
</tr>
</tbody>
</table>

- **To display Kerberos information for the Sentry,** enter the following command:

  ```
  show sentry kerberos
  ```

  Example of a request for Kerberos information:

  ```
  #show sentry kerberos
  ```
sentry-spn = HTTP/sentry.company.com
cache-ticket-idle-timeout = 48
cache-size = 1

- To display information for all UPNs in the Kerberos cache, enter the following command:
  show sentry kerberos cache dump [upn-filter]
  - upn-filter
    Optional. Full or partial UPN to filter on. Shows only the rows matching this string.
    Example of a request to display Kerberos UPN information for UPNs that match the upn-filter:
    # show sentry kerberos cache dump user
    Indx User-UPN Created(m) IdleTime(m)
    1 user@ironmobile.com 1010 7

- To display Kerberos information for a specific UPN in the Kerberos cache, enter the following command:
  show sentry kerberos cache upn <upn-string>
  - upn-string
    The full UPN of the UPN for which you want to display information.
    Example of a request to display Kerberos UPN information for a specific UPN:
    # show sentry kerberos cache upn user@ironmobile.com
    Kerberos Cache for UPN: user@ironmobile.com
    [0]user-upn = user@ironmobile.com
    [0]idle-time-min = 7
    [0]creation-time = Fri Jan 13 01:44:11 UTC 2012

Displaying Sentry statistics

Displays statistics for Sentry. You can specify parameters for global statistics or statistics for a specific device.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Sentry statistics for a specific device</td>
<td>show sentry statistics entry &lt;device-id&gt; &lt;user-id&gt;</td>
</tr>
<tr>
<td>Display Sentry global statistics for a specific device</td>
<td>show sentry statistics global [device</td>
</tr>
<tr>
<td>Display complete global Sentry system statistics</td>
<td>show sentry statistics global system [filter-string]</td>
</tr>
<tr>
<td>Display complete global Sentry statistics for a server</td>
<td>show sentry statistics global server [filter-string]</td>
</tr>
</tbody>
</table>

- To display complete Sentry statistics for a specific device, type the following command:
  show sentry statistics entry <device-id> <user-id>
  - device-id
    The id of the device for which you want information.
  - user-id
    The User associated with the device.
  Example:
  sentry#show sentry statistics entry ApplDN6FM6SZDKPH testuser2885
d-connection = 4
s-connections = 4
d-bytes-rcvd = 8572
s-bytes-sent = 8368
s-bytes-rcvd = 2704
d-bytes-sent = 2704
d-http-requests = 20
s-http-requests = 16
d-http-responses = 16
d-http-449 = 0
s-http-449 = 0
permits = 16
pendings = 0
blocks = 0

d-http-503-c2s = 0
d-http-400-c2s = 0
active-sync-status-reports = 0
sentry#
• **To display complete global Sentry statistics for devices**, type the following command:
  
  ```plaintext
  show sentry statistics global device <filter-string>
  ```

  - **filter-string**
    
    The full or partial string of one of the fields in the statistics report. The filter-string can either be a field name or a value in the field.

  Example of a request to display global statistics for devices, filtered on http-status:

  ```plaintext
  # show sentry statistics global device http-status
  http-status-200 = 388
  http-status-401 = 32
  http-status-404 = 0
  http-status-409 = 0
  http-status-5xx = 0
  http-status-other = 0
  ```

• **To display complete global Sentry system statistics**, type the following command:
  
  ```plaintext
  show sentry statistics global system [filter-string]
  ```

  - **filter-string**
    
    The full or partial string of one of the fields in the statistics report. The filter-string can either be a field name or a value in the field.

  Example of a request to display global Sentry statistics, filtered on peak:

  ```plaintext
  # show sentry statistics global system peak
  peak-heap-mem-used-MB = 389
  peak-date-heap-mem-used-MB = Thu Aug 27 22:32:30 UTC 2015
  peak-buff-cached-mem-used-MB = 1189
  peak-date-buff-cached-mem-used-MB = Thu Aug 27 22:33:30 UTC 2015
  peak-process-virtual-mem-used-MB = 2988
  peak-process-resident-mem-used-MB = 1049
  peak-date-process-resident-mem-used-MB = Thu Aug 27 22:34:30 UTC 2015
  peak-cpu-% = 14
  peak-date-cpu-% = Thu Aug 27 22:32:30 UTC 2015
  peak-mem-% = 39
  peak-date-mem-% = Thu Aug 27 22:32:30 UTC 2015
  peak-running-threads = 1
  peak-device-cache-size = 2
  peak-date-device-cache-size = Thu Aug 27 22:32:30 UTC 2015
  peak-user-url-cache-size = 0
  peak-date-user-url-cache-size = Thu Aug 27 22:32:30 UTC 2015
  peak-kerb-servtkt-cache-size = 0
  ```

  The full global statistics report can be downloaded in CSV format using the user interface. See [Sentry Statistics](#).

• To display complete global Sentry statistics for a server, type the following command:
  
  ```plaintext
  show sentry statistics global server <filter-string>
  ```

  - **filter-string**
    
    The full or partial string of one of the fields in the statistics report. The filter string can either be a field name or a value in the field.

  Example:

  ```plaintext
  sentry#show sentry statistics global server
  hc-connections = 6
  hc-bytes-sent = 816
  hc-bytes-rcvd = 1116
  hc-http-requests = 6
  hc-http-responses = 6
  hc-err-conn-timeout = 0
  hc-err-so-timeout = 0
  ```
Displaying information about servers

- To display server details and connection status, type the following command in EXEC mode:
  show sentry server status
  Example:
  sentry# show sentry server status

  Name/IP Status Failed Count

  Service Name : <ANY>
  Server Type : App Tunnel
  Server Scheduling : PRIORITY
  Server Declared Last Failure
  Name/IP Status Successful Failed Count

  Live Never 0

  Service Name : default
  Server Type : Active-Sync
  Server Scheduling : PRIORITY
  Active Background Health Check : Enabled
  Server Declared Last Last Failure
  Name/IP Status Successful Failed Count

  Live Never 0

Displaying Sentry system resources

- To display Sentry system resources, type the following command:
  show sentry utilization
  Example:
  sentry# show sentry utilization
  Number of Connected Devices : 0
  Number of Open Connections : 0
  Thread Pool Utilization : 0.0%
  CPU Utilization : 0%
  System Memory Utilization : 23%
  Heap Memory Utilization : 15%
Displaying Sentry log configuration

You can display the Sentry log configuration. To change the log configuration, see the commands in Logging.

To display the Sentry log configuration, type the following command:

```
show sentry log
```

Example of a request to display log configuration information:

```
# show sentry log
log-from-to = both
enable = true
verbosity = level3
```

Displaying Sentry log filters

You can display the log filters that are currently configured on Sentry. To configure the log filters, see Logging.

To display the Sentry log filters, type the following command:

```
show sentry log filter
```

Example of a request to display the log filters:

```
# show sentry log filter
TAG ENABLED TYPE VALUE
KensPhone true user-id ksmith
```

Displaying Sentry GC log configuration

You can display the garbage collection (GC) currently configured on Sentry. To configure GC, see Configuring garbage collection (GC).

To display the Sentry GC configuration, type the following command:

```
show sentry gc-log
```

Clearing the redirect URL

To clear a redirect URL from the Sentry, enter the following command:

**TABLE 53. CLEARING THE REDIRECT URL**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear redirect URL</td>
<td>debug sentry device-cache clear-redirect-url {all</td>
</tr>
</tbody>
</table>

To clear the redirect URL for a specific device, enter the following CLI command:
debug sentry device-cache clear-redirect-url entry <device-id> <user-id>

• <device-id>
The device id of the device for which you want to delete the redirect URL.
• <user-id>
The User associated with the device.

Example:
sentry/config#debug sentry device-cache clear-redirect-url entry
Appl75032TF7A4S testuser2674
sentry/config#

To clear the redirect URL for all devices, enter the following CLI command:
debug sentry device-cache clear-redirect-url all

Example
config# debug sentry device-cache clear-redirect-url all

**Configuring access to MobileIron UEM**

To configure new device access to the UEM server when the UEM server is not reachable, enter one of the following commands:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow new devices to access the server.</td>
<td>sentry emm-fail-open</td>
</tr>
<tr>
<td>Block new devices from accessing the server.</td>
<td>no sentry emm-fail-open</td>
</tr>
</tbody>
</table>

• To allow new devices to access the server when the UEM server is not reachable, type the following command in CONFIG mode:
sentry emm-fail-open
Example:
sentry/config# sentry emm-fail-open
sentry/config#

• To block new devices from accessing the server when the UEM server is not reachable, type the following command in CONFIG mode:
no sentry emm-fail-open
Example:
sentry/config# no sentry emm-fail-open
sentry/config#

**Enabling and disabling iptables**

The iptables service is enabled by default. Any changes to the configuration is persistent. A write is not required to save any changes in the configuration.
NOTE: If the iptables service is disabled, you cannot configure ACLs in the Sentry System Manager.

To enable or disable the iptables service at system startup, enter one of the following commands in CONFIG mode:

**TABLE 55. ENABLING AND DISABLING IPTABLES**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the iptables service.</td>
<td>service iptables enable</td>
</tr>
<tr>
<td>Disable the iptables service.</td>
<td>no service iptables</td>
</tr>
</tbody>
</table>

- To enable the iptables service, type the following command in CONFIG mode:
  
  `service iptables enable`

  Example:
  
  `sentry/config# service iptables enable`
  `sentry/config#`

- To disable the iptables service, type the following command in CONFIG mode:
  
  `no service iptables`

  Example:
  
  `sentry/config# no service iptables`
  `sentry/config#`

- To view whether the iptables service is enabled or disabled at system startup, type one of the following commands in EXEC mode:

  `show service`

  or

  `show running-config`

  Example:

  `sentry#show service`  
  +------------------------+------------+-----------+
  | Servicename | Enabled | Max.Sessions | 
  +------------------------+------------+-----------+
  ssh yes | 5 | 
  ntp yes | 
  iptables yes | 

  Example:

  `sentry#show running-config`  
  Display running configuration  
  interface GigabitEthernet 1  
  ip address 10.10.27.14 255.255.0.0  
  no shutdown  
  end  
  interface GigabitEthernet 2  
  no ip address  
  shutdown  
  end  
  interface GigabitEthernet 3  
  no ip address  
  shutdown  
  end  
  interface GigabitEthernet 4  
  no ip address  
  shutdown  
  end  
  ip route 0.0.0.0 0.0.0.0 10.10.1.1  
  no dbconfig  
  service ssh 5  
  service ntp`
no service iptables
ip name-server 10.10.15.6 0
ip name-server 10.11.50.31 1
ip domain-name auto.mobileiron.com
ntp 172.16.0.235 1
hostname app264.auto.mobileiron.com
timeout 0
system user miadmin ***
sentry#

• To view the iptables service status, type the following command in EXEC PRIVILEGED mode:
  #service iptables status
  Example:
  sentry# service iptables status

**curl**

A new **curl** CLI command is added to allow you to run cURL operation from EXEC Privileged mode.

The cURL features available through CLI are described in the following table:

**TABLE 56. CURL COMMANDS**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>cURL to the ActiveSync destination server</td>
<td>curl active-sync &lt;dest&gt; [port] [scheme] [protocol] [user]</td>
</tr>
<tr>
<td>cURL to the AppTunnel destination server</td>
<td>curl app-tunnel &lt;dest&gt; [port] [method] [scheme] [protocol] [user]</td>
</tr>
</tbody>
</table>

• **To curl to the ActiveSync destination server**, enter the following command:
  ```bash
  curl active-sync <dest> [port] [scheme] [protocol] [user]
  ```
  - dest
    Required. The IP address or hostname of the destination server.
  - port
    Optional. The port for the destination server. The default used is 443.
  - scheme
    Optional. The HTTP scheme. Enter HTTP or HTTPS. The default used is HTTPS.
  - protocol
    Optional. The SSL protocol version. Enter TLSv1, or SSLv2. The entry is ignored if SSL is not required. The default used is TLSv1.
  - user
    Optional. Enter the username for the destination server.
  Example:
  ```bash
  #curl active-sync activesyncserver.domainname.com
  ```

• **To curl to the AppTunnel destination server**, enter the following command:
  ```bash
  curl app-tunnel <dest> [port] [method] [scheme] [protocol] [user]
  ```
  - dest
    Required. The IP address or hostname of the destination server.
  - port
    Optional. The port for the destination server. The default used is 443.
Regenerating the Standalone Sentry self-signed certificate

You can regenerate the Standalone Sentry self-signed certificate using the command line interface (CLI). You can regenerate only the self-signed certificate or both self-signed and CA certificates.

Impact of regenerating the Standalone Sentry self-signed certificate

Regenerating the self-signed certificate will impact email and app tunnel deployments. The self-signed certificate will have to be re-pushed to the devices.

Regenerating the CA certificate, in addition, impacts MobileIron Tunnel. For MobileIron Tunnel, the CA certificate must be manually uploaded to the device.

How to regenerate the Standalone Sentry self-signed certificate

To regenerate the Standalone Sentry certificates, enter the following CLI command in configuration mode:

```
certificate {portal}
```

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regenerate Standalone Sentry self-signed portal certificate</td>
<td>certificate portal</td>
</tr>
</tbody>
</table>

To regenerate Standalone Sentry self-signed portal certificate, enter the following CLI command:

```
certificate portal
```

Example

```
config# certificate portal
Services will be disrupted.
Would you like to proceed? [y/n]:
```
If Standalone Sentry does not use a self-signed certificate

If Standalone Sentry does not use a self-signed certificate, then the `certificate {portal | sentry} command` will return the following message:

"Non Self-Signed Certificate in use. No Action performed"

Checking Kerberos Key Distribution Center (KDC) connectivity

To check connectivity and reachability to a KDC host use the following CLI command:

`debug sentry kerberos kdc`

This allows you to check that the port on the KDC host is reachable and ensure that the port is not blocked by firewall.

Executing the `debug sentry kerberos kdc` CLI command causes a TCP connection to the specified KDC host. If a port is not specified, the default KDC port 88 is used. The TCP connection is dropped immediately after establishing a connection without either sending or receiving any data.

Checking connectivity to a KDC host

To check connectivity to a KDC host, enter the following CLI command in configuration mode:

`debug sentry kerberos kdc <hostname> [port]`

- `hostname`
  The hostname for the KDC server.
- `port`
  The port for the KDC server. If port is not specified, the default port 88 is used.

**Successful example**

```
sentry/config# debug sentry kerberos kdc win2k8.acmetwo.acme.com
Connecting to KDC win2k8.acmetwo.acme.com, port 88
Connection successful.
Address: win2k8.acmetwo.acme.com/192.0.2.0:88
sentry/config#
```

**Failure example**

```
sentry/config# debug sentry kerberos kdc win2k8.acmeone.acme.com
Connecting to KDC win2k8.acmeone.acme.com, port 88
Connection failed.
java.net.UnknownHostException: win2k8.acmeone.acme.com
at java.net.AbstractPlainSocketImpl.connect(AbstractPlainSocketImpl.java:184)
at java.net.SocksSocketImpl.connect(SocksSocketImpl.java:392)
at java.net.Socket.connect(Socket.java:589)
at java.net.Socket.connect(Socket.java:538)
at java.net.Socket.<init>(Socket.java:434)
at java.net.Socket.<init>(Socket.java:211)
at com.mobileiron.alcor.controller.SentryAdminController.debugKerberosKDC(SentryAdminController.java:1085)
```
Verifying Kerberos configuration

To verify the Kerberos constrained delegation (KCD) setup, use the following CLI command:

```
debug sentry kerberos request-ticket
```

The CLI command issues a Kerberos ticket for a particular user. These tickets are issued for testing and debugging only and are not cached or reused.

**Table 58. Verifying Kerberos configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request a kerberos ticket on behalf of a user with a host:port combination</td>
<td><code>debug sentry kerberos request-ticket host-port &lt;upn&gt; &lt;realm&gt; &lt;hostname&gt; [port]</code>&lt;br&gt;• <code>upn</code>: user’s UPN&lt;br&gt;• <code>realm</code>: user’s REALM&lt;br&gt;• <code>hostname</code>: backend server’s hostname&lt;br&gt;• <code>port</code>: backend server’s port&lt;br&gt;The default value for port is 443.</td>
</tr>
<tr>
<td>Request a kerberos ticket on behalf of a user with an SPN</td>
<td><code>debug sentry kerberos request-ticket spn &lt;upn&gt; &lt;realm&gt; &lt;spn&gt;</code>&lt;br&gt;• <code>upn</code>: user’s UPN&lt;br&gt;• <code>realm</code>: user’s REALM&lt;br&gt;• <code>spn</code>: service principal name</td>
</tr>
</tbody>
</table>

Initializing Kerberos

To initialize Kerberos, use the following CLI command:

```
debug sentry kerberos init
```

The CLI command initializes Kerberos. If Kerberos is already initialized, executing the command has not impact.

Stopping and restarting Standalone Sentry services

You can stop, start, or restart the following Standalone Sentry services from the Standalone Sentry command line interface (CLI):

- `iptables`
- `tomcat`
- `tomcat2`

Restarting a service, stops the service and then restarts the service automatically.
### TABLE 59. STOPPING AND RESTARTING STANDALONE SENTRY SERVICES

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop a service</td>
<td>`service [iptables</td>
</tr>
<tr>
<td>Start a service</td>
<td>`service [iptables</td>
</tr>
<tr>
<td>Restart a service</td>
<td>`service [iptables</td>
</tr>
<tr>
<td>View service status</td>
<td>`service [iptables</td>
</tr>
</tbody>
</table>

This allows the administrator to stop, start, or restart a Standalone Sentry service without having to reboot Standalone Sentry and prevents disruption to other services that are running.

### Impact of stopping and restarting Standalone Sentry services

- Stopping or restarting tomcat2 will impact access to Standalone Sentry system manager UI and CLI commands. The Standalone Sentry system manager will not be available and you will be able to execute only a subset of the CLI commands.
- Stopping or restarting tomcat or iptables services will impact Standalone Sentry traffic till the service is back up and running.
- After stopping a service through the CLI, restarting Standalone Sentry also restarts the service.

### How to stop and restart Standalone Sentry services

- **To stop a service**, enter the following command:
  
  ```
  service [iptables | tomcat | tomcat2] stop
  ```

  Example for stopping tomcat:

  ```
  sentry# service tomcat stop
  ```

- **To start a service**, enter the following command:

  ```
  service [iptables | tomcat | tomcat2] start
  ```

  Example for starting tomcat:

  ```
  sentry# service tomcat start
  ```

- **To restart a service**, enter the following command:

  ```
  service [iptables | tomcat | tomcat2] restart
  ```

  Example for restarting tomcat:

  ```
  sentry# service tomcat restart
  ```

- **To view service status**, enter the following command:

  ```
  service [iptables | tomcat | tomcat2] status
  ```

  Example for viewing tomcat:

  ```
  sentry# service tomcat status
  ```

### Configuring kernel parameters

To configure kernel parameters, enter the following command in CONFIG mode:

```
kparam {rp_filter | log_martians | kernel_panic | tcp_sack} [kvalue]
```
**TABLE 60. CONFIGURING KERNEL PARAMETERS**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set this value to filter the kernel parameters.</td>
<td>kparam rp_filter [kvalue]</td>
</tr>
<tr>
<td></td>
<td>kvalue is 0, 1 or 2.</td>
</tr>
<tr>
<td>Set this value to allow any unsigned integer value.</td>
<td>kparam log_martians [kvalue]</td>
</tr>
<tr>
<td></td>
<td>kvalue is 0 or 1.</td>
</tr>
<tr>
<td>Set this value to allow safe recovery of any kernel malfunction.</td>
<td>kparam kernelpanic [kvalue]</td>
</tr>
<tr>
<td></td>
<td>kvalue is an integer equal to or greater than 0.</td>
</tr>
<tr>
<td>Set this value to configure TCP SACK.</td>
<td>kparam tcp_sack [kvalue]</td>
</tr>
<tr>
<td></td>
<td>kvalue is kvalue is 0 or 1.</td>
</tr>
</tbody>
</table>

**Using the Splunk forwarder service**

You can enable and perform other actions for the Splunk forwarder service from the Standalone Sentry command line interface (CLI).

The following table lists the commands.

**TABLE 61. SPLUNK FORWARDER SERVICE CLI COMMANDS IN STANDALONE SENTRY**

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the Splunk forwarder service</td>
<td>service splunk-forwarder enable</td>
<td>CONFIG</td>
</tr>
<tr>
<td>Disable the Splunk forwarder service</td>
<td>no service splunk-forwarder</td>
<td>CONFIG</td>
</tr>
<tr>
<td>Start Splunk forwarder service</td>
<td>service splunk-forwarder start</td>
<td>EXEC PRIVILEGED</td>
</tr>
<tr>
<td>Stop Splunk forwarder service</td>
<td>service splunk-forwarder stop</td>
<td>EXEC PRIVILEGED</td>
</tr>
<tr>
<td>Status of the Splunk forwarder service</td>
<td>service splunk-forwarder status</td>
<td>EXEC PRIVILEGED</td>
</tr>
<tr>
<td>Restart the Splunk forwarder service</td>
<td>service splunk-forwarder restart</td>
<td>EXEC PRIVILEGED</td>
</tr>
<tr>
<td>Verify if the service is enabled or disabled</td>
<td>show service</td>
<td>EXEC</td>
</tr>
</tbody>
</table>

**Changing TLS protocols**

To change the TLS protocol version, use the following CLI command in CONFIG mode:
You can configure the following TLS versions:

- TLSv1
- TLSv1.1
- TLSv1.2.

Enter the versions as a comma-separated list. The updates will be applied to port 8443 and 9090 only. By default, TLSv1 is disabled and TLSv1.1 and TLSv1.2 are enabled on ports 8443 and 9090.

Example:
```
sentry/config# httpd protocol protocol-list
tlsv1.1,tlsv1.2
Changes will issue restart of httpd service and Sentry system service might be disrupted. Would you like to proceed? [y/n]: y
sentry/config# do show httpd protocol
+-------------------------+---------+------------+
<table>
<thead>
<tr>
<th>Port</th>
<th>TLS Protocols Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>8443</td>
<td>TLSv1.1,TLSv1.2</td>
</tr>
<tr>
<td>9090</td>
<td>TLSv1.1,TLSv1.2</td>
</tr>
</tbody>
</table>
```

Checking TLS compliance

For improved security, MobileIron recommends that TLS v1.2 is used and TLS v1.0 and v1.2 are disabled. You can check which servers that MobileIron Sentry connects with support TLS v1.2 using one of the following methods from the Standalone Sentry command line interface (CLI):

- Using CLI command to check TLS compliance
- Running TLS compliance utility

Both methods return an OK or FAILED value for each server that is checked.

OK indicates that Standalone Sentry is able to successfully connect with the server on TLS v1.2.

FAILED indicates that Standalone Sentry cannot connect with the server on TLS v1.2.

The results are also recorded into a log file /var/log/TLSTrafficTool-timestamp.log. The log file is included in ShowTech-All. In case of failure, additional error message content as provided by OpenSSL displays and is recorded in the log file. MobileIron recommends upgrading the failed servers to support TLS v1.2.

Using CLI command to check TLS compliance

You can use a CLI command instead of the utility.

Use the following Standalone Sentry command in EXEC PRIVILEGED mode to check TLS compliance:
```
tlscheck {all | server <server> [port]}
```
The command checks the servers that Sentry connects with and returns an OK or FAILED value for each server it checks.

To check TLS compliance for all servers that Standalone Sentry connects with, enter the following command:

tlscheck all

To check TLS compliance for specified servers that Standalone Sentry connects with, enter the following command:

tlscheck server server [port]

where:

- server is the IP address or the hostname of the server
- port is the port on which the server listens. If the port is not specified, 443 is used.

**Running TLS compliance utility**

MobileIron provides an utility that you can execute from the Standalone Sentry CLI that checks if Sentry can successfully connect with the server on TLS v1.2.

From the Standalone Sentry command line interface, enter the following command in EXEC PRIVILEGED mode:

```
#install rpm url url_for_the_rpm
```

The command executes a script that checks the servers that Sentry connects with and returns an OK or FAILED value for each server it checks. The script uninstalls after each run.

**Enabling and disabling SSL HSTS**

Enabling HSTS (RFC 6797) enforces secure HTTPS connection between a web browser and Standalone Sentry. By default, HSTS is disabled.

Before enabling HSTS ensure the following:

- Standalone Sentry uses a root or intermediate certificate from a publicly trusted CA.
- You have policies and processes to ensure that the certificate is current.
- Port 443 is open.

To enable SSL HSTS, use the following CLI command in CONFIG mode:

```
httpd hsts enable
```

If HSTS is enabled, the following header is added to the HTTP response:

```
Strict-Transport-Security "max-age=31536000; includeSubDomains; preload"
```

To disable SSL HSTS, use the following CLI command in CONFIG mode:

```
no httpd hsts
```
NOTE: After disabling HSTS, also clear HSTS for the Standalone Sentry FQDN from your browser cache.
Otherwise, the browser continues to attempt to load the Standalone Sentry FQDN with a secure connection and you will not be able to access the site.

To view the current status of SSL HSTS, use the following CLI command in EXEC mode:
```
show httpd hsts
```

# Upgrading using CLI

The following describe the steps for upgrading the Standalone Sentry version using CLI:

1. Configuring your update repo
2. Initiating the upgrade
3. Rebooting Standalone Sentry
4. Verifying that the upgrade is complete

## Configuring your update repo

The following procedure describes the steps to update the repo.

**Procedure**

1. Log into the Standalone Sentry command line interface (CLI) using the administrator account you created during installation.
2. Enter the following command to switch to EXEC Privileged mode:
   ```
   enable
   ```
3. Enter the password for enabling the EXEC Privileged mode.
   The command line prompt changes:
   ```
   #
   ```
4. Enter the following command to enable CONFIG mode:
   ```
   configure terminal
   ```
5. Enter the following command to specify the URL and credentials for the repo:
   ```
   software repository https://support.mobileiron.com/mi/sentry/<version>/ <username> <password>
   ```
   where `<username>` and `<password>` are your company’s software download/documentation credentials as provided by MobileIron Support.
   For the upgrade URL, see the *Standalone Sentry Release Notes* for the release.

**NOTE:**
- The CLI upgrade will fail if the trailing ‘/’ after the version number is missing.
  Example: Enter `...sentry/9.0.0/`.
  If the trailing ‘/’ is missing, you will see the following error message:
  ```
  Unable to find applicable update packages in software repository. Please check URL.
  ```
6. Enter the following command to exit CONFIG mode:
   ```
   end
   ```
Initiating the upgrade

The following procedure describes the steps to initiate the upgrade.

Procedure
1. In EXEC Privileged mode enter the following command:
   `software checkupdate`
2. Confirm that there are no errors displayed.
3. Enter the following command to download the latest available updates:
   `software update`

Rebooting Standalone Sentry

The following procedure describes the steps to reboot Standalone Sentry.

Procedure
1. After all the listed updates are installed, in EXEC Privileged mode, enter the following command to reload the appliance:
   `reload`
   The following message displays:
   `System configuration may have been modified. Save? [yes/no]`
2. Enter yes.
   The following message displays:
   `Proceed with reload? [yes/no]`
3. Enter yes.

Verifying that the upgrade is complete

The following procedure describes the steps to verify the upgrade.

Procedure

In EXEC Privileged mode enter:
   `show version`

The Sentry Standalone version should be the version to which you upgraded.

Configuring a proxy server for upgrades

In cases where you may have a proxy server sitting between Standalone Sentry and support.mobileiron.com, you can configure the upgrade to go through the proxy server. The following table describes the commands for configuring a proxy server for software upgrades:
**Table 62. Configuring proxy server for software upgrades**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Command in CONFIG mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure a proxy server for software upgrades</td>
<td>software outbound-proxy &lt;hostname&gt; &lt;port&gt; [username] [password]</td>
</tr>
<tr>
<td></td>
<td>• hostname: The hostname or IP address of the proxy server.</td>
</tr>
<tr>
<td></td>
<td>• port: Port number on the proxy server for Sentry.</td>
</tr>
<tr>
<td></td>
<td>• username: Username to authenticate to the proxy server if authentication is required.</td>
</tr>
<tr>
<td></td>
<td>• password: Password to authenticate to the proxy server if authentication is required.</td>
</tr>
<tr>
<td>Disable proxy server configuration</td>
<td>no software outbound-proxy</td>
</tr>
<tr>
<td><strong>Feature</strong></td>
<td><strong>Command in EXEC or PRIVILEGED mode</strong></td>
</tr>
<tr>
<td>Display proxy server information</td>
<td>show software outbound-proxy</td>
</tr>
</tbody>
</table>

Example for configuring a proxy server for software upgrades:

```
sentry/config# software outbound-proxy proxyserver.company.com 8080
```

**Upgrading multiple Sentry**

You can upgrade multiple Standalone Sentry at the same time using the Sentry CLI.

**Before you begin**

- Download the upgradeConfig.json file from the MobileIron support site to a location where Standalone Sentry can access the file.
- Edit the upgradeConfig.json file with the following details:
  - targetVersion: Enter the version of the Sentry that you want to upgrade to.
  - emailTo: Enter the email (comma separated email IDs) to receive upgrade notifications.
  - sentryGroup: Group the existing Sentries in your deployment.
  - sentryList (on-prem): Enter the FQDN of the Sentry that you want to upgrade.
  - sentryList (cloud): Enter the IP Address for the Sentry on cloud that you want to upgrade.
  - sentryUpgradeGroupList: Enter the Sentry groups that you want to upgrade.

**Procedure**

1. Log into the CLI using the administrator account you created during installation.
2. Enter the following command to switch to EXEC Privileged mode:
   ```
   enable
   ```
3. Enter the password for enabling the EXEC Privileged mode.
   The command line prompt changes:
   ```
   #
   ```
4. Enter the following command to enable CONFIG mode:
   ```
   configure terminal
   ```
5. Enter the following command to configure software autoupgrade:

```
software autoupgrade <urlstring> [username] [password]
```

where
- `upgrade URL string` is the location where the `upgradeConfig.json` file is hosted.
- `username` and `password` are credentials to access the `upgradeConfig.json` file.

6. Enter the following command to exit:

```
end
```

**Related topics**
- Disabling auto-upgrade
- Viewing auto-upgrade details

**Viewing auto-upgrade details**

Do the following to view the auto-upgrade configuration details.

**Procedure**

1. Log into the Standalone Sentry command line interface (CLI) using the administrator account you created during installation.
2. Enter the following command to switch to EXEC Privileged mode:

```
enable
```
3. Enter the password for enabling the EXEC Privileged mode.
   - The command line prompt changes:
   ```
   #
   ```
4. Enter the following command to view auto-upgrade configuration:

```
show software autoupgrade
```
   - The auto-upgrade configuration details are displayed.
5. Enter the following command to exit:

```
end
```

**Disabling auto-upgrade**

When auto-upgrade is enabled, Standalone Sentry checks for upgrades every thirty minutes. Do the following to disable auto-upgrade.

**Procedure**

1. Login to the CLI using the administrator account you created during installation.
2. Enter the following command to switch to EXEC Privileged mode:

```
enable
```
3. Enter the password for enabling the EXEC Privileged mode.
   - The command line prompt changes:
   ```
   #
   ```
4. Enter the following command to enable CONFIG mode:

```
configure terminal
```
5. Enter the following command to disable auto-upgrade:
no software autoupgrade
The auto-upgrade configuration details are removed.
6. Enter the following command to exit:
   end
