Preface

Document conventions

The document conventions describe text formatting conventions, command syntax conventions, and important notice formats used in Ivanti technical documentation.

Text formatting conventions

Text formatting conventions such as boldface, italic, or Courier font may be used in the flow of the text to highlight specific words or phrases.

Format	Description
bold text	Identifies command names
	Identifies keywords and operands
	Identifies the names of user-manipulated GUI elements
	Identifies text to enter at the GUI
<i>italic text</i>	Identifies emphasis
	Identifies variables
	Identifies document titles
Courier Font	Identifies command output
	Identifies command syntax examples

Command syntax conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.

Convention	Description
<i>italic text</i>	Identifies a variable.
[]	Syntax components displayed within square brackets are optional. Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Non-printing characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, member[member...].
\	Indicates a "soft" line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

Notes and Warnings

Note, Attention, and Caution statements might be used in this document.

A Note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An Attention statement indicates a stronger note, for example, to alert you when traffic might be interrupted or the device might reboot.

CAUTION

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

Requesting Technical Support

Technical product support is available through the Ivanti Global Support Center (PSGSC). If you have a support contract, file a ticket with PSGSC.

- Product warranties—For product warranty information, visit <https://support.pulsesecure.net/product-service-policies/>

Self-Help Online Tools and Resources

For quick and easy problem resolution, Ivanti provides an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://support.pulsesecure.net>
- Search for known bugs: <https://support.pulsesecure.net>
- Find product documentation: <https://www.ivanti.com/support/product-documentation>
- Download the latest versions of software and review release notes: <https://support.pulsesecure.net>
- Open a case online in the CSC Case Management tool: <https://support.pulsesecure.net>
- To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://support.pulsesecure.net>

For important product notices, technical articles, and to ask advice:

- Search the Pulse Secure Knowledge Center for technical bulletins and security advisories: <https://kb.pulsesecure.net>
- Ask questions and find solutions at the Pulse Community online forum: <https://community.pulsesecure.net>

Opening a Case with PSGSC

You can open a case with PSGSC on the Web or by telephone.

- Use the Case Management tool in the PSGSC at <https://support.pulsesecure.net>.
- Call 1-844 751 7629 (Toll Free, US).

For international or direct-dial options in countries without toll-free numbers, see <https://support.pulsesecure.net/support/support-contacts/>

Introducing REST

REST (REpresentational State Transfer) is a framework for API design. It is based on generic facilities of the standard HTTP protocol, including the six basic HTTP methods (GET, POST, PUT, DELETE, HEAD, INFO) and the full range of HTTP return codes.

A REST interface partitions the API into a series of "resources," each of which can be accessed using one or more HTTP methods. (In the Traffic Manager, only the GET, PUT, and DELETE methods are used; HEAD, POST and INFO are not currently implemented). Each method operates in the Traffic Manager as follows:

- **GET:** Obtain a representation of the resource, without modifying server state (except perhaps for logging purposes).
- **PUT:** Create a new resource or apply some change to a resource. Where the resource exists, only those properties specified in the request are modified; all others remain unchanged. If a resource object does not exist, a new one is created.
- **DELETE:** Delete an existing resource.

Importantly, each resource is uniquely identified with an address, or URI (Uniform Resource Identifier). In other words, if you know the URI you can access the resource (subject to the normal authorization/authentication processes associated with accessing the administrative systems of the Traffic Manager).

Since all resources have URIs, resources can point to other resources by embedding the URIs of related resources within their representations.

In the Traffic Manager, all resources are represented and stored as JSON (JavaScript Object Notation) structures. Requests and responses that interact with the Traffic Manager through the REST API must adopt the same format.

The full range of HTTP return codes is available in REST, although in practice a useful subset can be identified and applied consistently. So, for example, it should be evident from the response itself whether a request has succeeded or not, without any need for parsing the body of the response. However, the Traffic Manager always attempts to provide extra information regarding a failure into the response body. For more details, see [Errors](#).

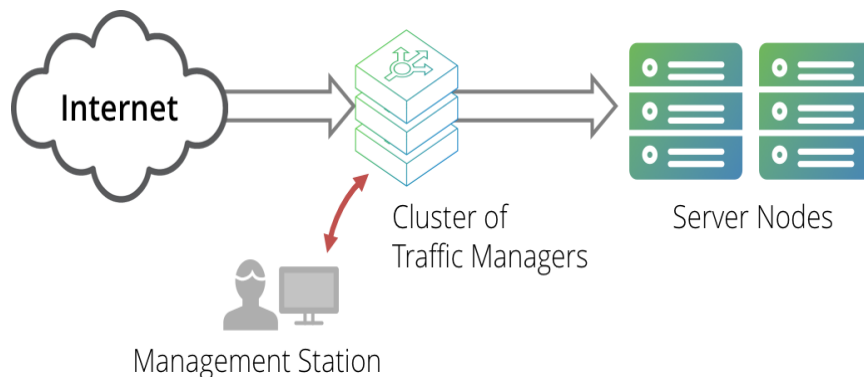

Why use a REST API

REST interfaces have become popular in public APIs because of their inherent simplicity. An API can focus on available resources, with details regarding updating and deleting of each resource delegated to the appropriate HTTP method in predictable ways.

The purpose of implementing a REST API is not primarily to add functionality but to add structure. Because of the inherent similarity of all REST APIs (by virtue of their underlying HTTP structure), familiarity with any REST API brings familiarity with all of them. In many cases it is just as easy to implement to a REST design as it is to use a more ad hoc API design, while reaping the benefits that come with well-understood REST conventions.

Finally, the availability of return codes is another example of leveraging known semantics when building a useful API. Without a meaningful return code it becomes necessary to parse every response to find out whether it worked or not. In addition, most modern browsers and Web programming frameworks expect that specific HTTP error codes are set in the event of error and respond differently depending on the code. This is especially apparent in the case of AJAX requests, which are often handled differently by many modern Javascript frameworks depending on the status code returned from the server.

A REST-Based Architecture

A cluster of Traffic Managers is typically managed through the web-based administration user interface (Admin UI) on one of the cluster members. The Traffic Manager's REST API provides an alternative means to remotely administer, configure, and monitor a Traffic Manager cluster.

The REST service is enabled by default for new Traffic Manager instances. To toggle the REST service between enabled and disabled, see [Enabling and Disabling the API](#).

For Traffic Managers running version 11.0 or earlier, the REST service is disabled by default. To preserve the integrity of your configuration, the REST service state is unchanged during an upgrade to a Traffic Manager version later than 11.0.

The Traffic Manager REST API can be used by any HTTP client or application environment that supports HTTP services.

A management application can issue a REST request to any one of the Traffic Managers in a cluster. The application may be running on a stand-alone management server, one of the server nodes, or even on one of the Traffic Managers. All Traffic Managers in the cluster automatically synchronize their configuration, so a configuration change sent to one machine is automatically replicated across the cluster.

ATTENTION

When upgrading your Traffic Manager cluster to the latest software version, do not attempt to use the REST API until all cluster members have been successfully upgraded. As configuration is automatically synchronized across all cluster members, only one Traffic Manager should be used to update the entire cluster at a time. Use of the REST API on a cluster in a mixed-version state can result in unexpected behavior. For more information on upgrading, see the Pulse Secure Virtual Traffic Manager: Installation and Getting Started Guide applicable to your product variant.

ATTENTION

Due to the nature of the REST API's ability to access and modify your Traffic Manager configuration, it is strongly recommended that you disallow access to this service from outside of your trusted network.

Scope of This Release

This document describes the features and capabilities of the REST API for the Pulse Secure Virtual Traffic Manager 21.4 release. The REST API version referred to in this document is 8.3.

The API performs basic type checking, although Ivanti recommends that your client applications provide suitable validation to ensure the suitability of the configuration data being provided to the Traffic Manager.

All defined users in the system have the ability to authenticate a connection through the Traffic Manager REST API. However, you cannot modify the users configuration file in any way, so it is not possible to add, edit, or delete users through the API.

A full list of specific features, capabilities, and API versions supported by this release can be found in the release notes supplied with your product variant.

Typical Usage in the Traffic Manager

This chapter describes the usage, syntax, and structure of the Traffic Manager REST API.

The Resource Model

The Traffic Manager REST API is made up of a hierarchy of resources that are manipulated using standard HTTP calls to a listener service running along side the Traffic Manager. HTTP URIs are used to address the resources in the system.

There are three resource types:

- Configuration: to represent Traffic Manager configuration objects.
- Counters: for reporting through SNMP counters.
- Information: for system information.

Counters and Information resources are read-only, whereas Configuration resources are fully interactive and map directly to the native Traffic Manager configuration system. Each concept, such as pools, virtual servers, TrafficScript rules, or Service Level Monitoring classes, has an associated configuration resource model.

All resources are represented as JSON structures (MIME type application/json), and objects of each resource type are captured in this format.

Typically, a configuration resource follows this format:

```
{
  "properties": {
    "sectionname": {
      "key1": "stringvalue1",
      "key2": numericvalue2,
      "key3": booleanvalue3
    }
  }
}
```

A single instance of a resource, for example a virtual server, contains a primary group entitled "properties". This contains all configuration keys attributable to this resource type.

Counter resources contain dynamically generated data to correspond to SNMP counters in the Traffic Manager.

Sections

Sections are designed to contain properties (or "keys") that have a commonality of purpose or perhaps apply in certain circumstances. For example, monitor classes may have keys that apply only to monitors of particular types.

In a configuration resource, the properties group contains several sections, one for each logical set of keys. There is always a section entitled "basic," containing common configuration items, followed by one or more additional sections according to the specification of the resource.

A counter resource contains a single section, "statistics," listing the SNMP counters associated with the resource. Similarly, an information resource contains a single section, "information," listing the system information properties applicable to this Traffic Manager.

Data Types

Each key:value pair is then presented as a comma-separated list within each section, according to the specification shown throughout this guide. Key names are always delimited by quotes, with the values according to the following rules:

Type	Value
Boolean	A value of true or false (case-sensitive). For example: <code>"key1": true,</code> <code>"key2": false</code>
Int	A numeric positive or negative value with no decimal point. For example: <code>"key1": 1024,</code> <code>"key2": -10</code>
Unsigned Int	A numeric positive value with no decimal point. For example:

Type	Value
	<pre>"key1": 0, "key2": 50</pre>
Float	<p>A numeric positive or negative value that can have a decimal point.</p> <p>For example:</p> <pre>"key1": 1.0, "key2": -1024.111</pre>
String	<p>A set of alpha-numeric characters that may not include new-lines. Non-alpha characters must use correct character escapes.</p> <p>For example:</p> <pre>"key1": "Hello world", "key2": "", "key3": "Hello y\'all"</pre>
Freeform String	<p>A set of alpha-numeric characters that can contain new-lines. Non-alpha characters must use correct character escapes, and a newline must be represented by a \n.</p> <p>For example:</p> <pre>"key1": "Multi-line\nString",</pre>
Password	<p>A string that cannot be read, only written to. When read, it is displayed as a structure that indicates if the password has been set (is non-empty).</p> <p>For example, when reading the key:</p> <pre>"key1": { "password_set": false }, "key2": { "password_set": true }</pre> <p>When writing to the key, the structure can be unchanged, or a new password can be set:</p> <pre>"key2": { "password_set": true }, "key1": "secret123"</pre>
Time	<p>Times are represented as strings in ISO8601 time format, including a time zone designator.</p>

Type	Value
	<p>For example:</p> <pre>{Year}-{Month}-{Day}T{Hour}:{Minute}:{Second}{Time Zone}</pre>
Set	<p>This is a collection of unique unordered items of a particular type, stored as an array.</p> <p>For consistency, a set is rendered in alpha-numeric order.</p> <p>For example:</p> <pre>"key": ["Item A", "Item B", "Item D"]</pre>
List	<p>This is a collection of ordered items of a particular type. It may contain duplicates and is stored as a standard array.</p> <p>For example:</p> <pre>"key": ["Item A", "Item C", "Item A"]</pre>
Tables	<p>This is a special type designed to allow nested data within a single config key. In some circumstances, you might wish to specify a list or array of data items, such as a list of pool nodes, where each item has one or more extra pieces of configuration data to be attached to it.</p> <p>Each one of these nested list entries expects a value known as the "primary key", used to identify it. Each sub-key value should then be specified in the same way.</p> <p>For example:</p> <pre>"key": [{ "prmkey": "Hello World", "subkey1": false, "subkey2": ["Item 1", "Item 2"] }, { "prmkey": "Other text", "subkey1": true, "subkey2": [] }]</pre>

Type	Value
	<pre>},]</pre>

Resource URI Patterns

Resource URIs are case-sensitive.

The Traffic Manager provides access to its resources through a common base URI that identifies the root of the resource model:

```
https://<host>:<port>/api/tm/<version>
```

In this URI path:

- **<host>**: The hostname of the Traffic Manager whose REST API you are accessing.
- **<port>**: The port that the REST API is published on (typically "9070").
- **<version>**: The version number of the REST API you are accessing. Details of supported versions are contained in the release notes supplied with your product variant.

All client applications and scripts that access the Traffic Manager REST API must use the same supported major version of the API at any one time. The Traffic Manager does not support interactions using multiple versions concurrently.

In the previous example, a scheme of HTTPS is used to signify an encrypted connection from a remote client. HTTP is supported only where the connection is to a server on the same host. For further details, see [Authentication](#).

The Traffic Manager presents different resource types at specific child nodes under this root URI.

Configuration Resources

Configuration resources map to objects in the Traffic Manager's configuration system. To access configuration resources, use the following URI pattern:

```
https://<host>:<port>/api/tm/<version>/config/active
```

Instances of a particular configuration resource, such as a virtual server, are persistently stored and alter the host Traffic Manager's behavior if changed. Additionally, changes you make here are synchronized automatically to all other Traffic Managers in the cluster.

To view or modify a stored configuration resource record, append the full path to the end of the base URI. For example, to issue a request for a virtual server resource named "Web", use the following URI:

```
https://myhost:9070/api/tm/8.3/config/active/virtual_servers/Web
```

Counter and Information Resources

Counter resources map to SNMP counter objects generated by the Traffic Manager. To access counter resources, use the following URI pattern:

```
https://<host>:<port>/api/tm/<version>/status/<tm>/statistics
```

Information resources provide basic information data about your cluster members. To access information resources, use the following URI pattern:

```
https://<host>:<port>/api/tm/<version>/status/<tm>/
```

Unlike configuration resources, instances of counter and information resources are specific to each Traffic Manager in the cluster. You can access the data for all of your cluster members from the base URI of any one of them by specifying the desired member hostname in the /<tm>/ child node.

For example, to request the SNMP counter data from cluster member "myhost2" for a pool named "P1", use the following URI:

```
https://myhost:9070/api/tm/8.3/status/myhost2/statistics/pools/P1
```

The child node <tm> also accepts the special node name "local_tm", to refer to the REST API of the Traffic Manager you are accessing. For further information, see [Traversing the Tree](#).

Traversing the Tree

Resource URIs can be either:

- Resources.
- A directory structure containing child elements denoting sub-directories or resource nodes.

You can test the overall availability of the REST API by querying the following URI in a compatible Web browser or JSON/REST query application:

```
https://<host>:<port>
```

(As mentioned above, <host> is the hostname of the Traffic Manager and <port> is the port that the REST API is published on).

Some versions of Internet Explorer are unable to directly render the "application/json" MIME type data returned from a Traffic Manager REST API query. Ivanti recommends using an alternative browser. However, to resolve the issue for affected browsers, amend the Windows registry as shown here:

1. Open Notepad and enter the following text:

```
Windows Registry Editor Version 5.00;
Tell IE 7,8,9,10,11 to open JSON documents in the browser on Windows XP and later.
25336920-03F9-11cf-8FD0-00AA00686F13 is the CLSID for the "Browse in place".
[HKEY_CLASSES_ROOT\MIME\Database\Content Type\application/json]
"CLSID"="{25336920-03F9-11cf-8FD0-00AA00686F13}"
"Encoding"=hex:08,00,00,00
```

2. Save the document as "IE-Json.reg" and then run it.
3. Restart Internet Explorer and re-enter a REST URI to confirm the JSON results appear within the browser.

For further information, see <http://www.codeproject.com/Tips/216175/View-JSON-in-Internet-Explorer>.

A GET request for this URI should yield the following result:

```
{
  "children": [{
    "name": "api",
    "href": "/api/"
  }]
},
```

This shows that the REST service at <host>:<port> contains a single child element "/api". As discussed in [Resource URI Patterns](#), the full root URI of the configuration resource model then becomes:

```
https://myhost:9070/api/tm/8.3/config/active
```

Therefore, requesting this URI results in a list of child elements similar to the following example:

```
{
  "children": [{
    "name": "action_programs",
    "href": "/api/tm/8.3/config/active/action_programs/"
  }, {
    "name": "actions",
    "href": "/api/tm/8.3/config/active/actions/"
  }, {
    "name": "aptimizer",
    "href": "/api/tm/8.3/config/active/aptimizer/"
  }, {
    "name": "bandwidth",
    "href": "/api/tm/8.3/config/active/bandwidth/"
  }, {
    "name": "cloud_api_credentials",
    "href": "/api/tm/8.3/config/active/cloud_api_credentials/"
  }, {
    ...
  } (truncated)
  ...
  }, {
    "name": "virtual_servers",
    "href": "/api/tm/8.3/config/active/virtual_servers/"
  }
}]
}
```

This output identifies all configuration resource types available through the Traffic Manager being queried. Each is identified by a name and href attribute combination.

A query for a specific resource type shows all instances of that resource defined within the Traffic Manager configuration. For example, the following URI lists all virtual servers:

```
https://myhost:9070/api/tm/8.3/config/active/virtual_servers
```

The output shows each stored virtual server, as per the following example:

```
{
  "children": [{
    "name": "vs1",
    "href": "/api/tm/8.3/config/active/virtual_servers/vs1"
  }, {
```

```
    "name": "vs2",
    "href": "/api/tm/8.3/config/active/virtual_servers/vs2"
  }]
}
```

SNMP counter and system information resources are unique to each Traffic Manager in the cluster. You can access the data for each cluster member from the API of whichever Traffic Manager you are connected to.

To list the available Traffic Managers in your cluster, perform a request for the following URI:

```
https://myhost1:9070/api/tm/8.3/status
```

The response is a list of child elements similar to the following:

```
{
  "children": [{
    "name": "myhost1.example.com",
    "href": "/api/tm/8.3/status/myhost1.example.com/"
  }, {
    "name": "myhost2.example.com",
    "href": "/api/tm/8.3/status/myhost2.example.com/"
  }, {
    "name": "myhost3.example.com",
    "href": "/api/tm/8.3/status/myhost3.example.com/"
  }, {
    "name": "local_tm",
    "href": "/api/tm/8.3/status/local_tm/"
  }]
}
```

The list also includes the "local_tm" child node that corresponds to the REST API of the Traffic Manager you are currently accessing. This provides a consistent programmatic interface to access resources for the local Traffic Manager only, no matter which host's API you are connected to. For example, the following URI can be used on the API of any Traffic Manager in the cluster, and the response contains results for that Traffic Manager only:

```
/api/tm/8.3/status/local_tm/information
```

To view (or modify, in the case of configuration resources) a stored record for a particular resource type, append the full path to the end of this base URI. For example, a request for a virtual server configuration resource named "Web" looks like this:

```
https://myhost:9070/api/tm/8.3/config/active/virtual_servers/Web
```

Equally, a request for the SNMP counter output for a pool named "P1" looks like this:

```
https://myhost:9070/api/tm/8.3/status/local_tm/statistics/pools/P1
```

The Traffic Manager REST Service

The Traffic Manager REST API is an HTTP service running on the Traffic Manager server. By default, it is available on TCP port 9070, although this can be reconfigured. The REST service supports HTTP versions: 0.9, 1.0, and 1.1; Version 1.1 is recommended.

When connecting to the local machine using a loop-back interface (for example, 127.0.0.1 or "localhost"), plain HTTP must be used. When connecting from a remote machine, connections must be encrypted using SSL (HTTPS).

The service uses the same SSL certificate as the Traffic Manager's admin server, which by default is an automatically generated self-signed certificate. Any HTTP client used to connect to the REST API should have the server's self-signed certificate added to its trusted certificate catalogue. Alternatively the admin server/REST certificate can be replaced with one signed by a trusted certificate authority.

The Pulse Secure Virtual Web Application Firewall REST Interface

The Pulse Secure Virtual Web Application Firewall (vWAF) component maintains a separate REST interface to facilitate control of vWAF-specific resources. You can reach this interface through the standard Traffic Manager REST service, using the following path:

```
https://<host>:<port>/api/af/<version>
```

<version> can be any specific currently published API version, or you can use the string "latest" to access the most current version. Full details of the available resources and actions that can be performed through the vWAF REST API can be found in the vWAF user documentation.

To access the vWAF REST interface, you must first install and activate the vWAF component on your Traffic Manager. You must also enable the Traffic Manager REST service through the Admin UI (for details, see [Enabling and Disabling the API](#)).

The Traffic Manager operates as a proxy to the vWAF REST service, and communicates with it through a designated port. To view and modify this port, click **System > Application Firewall > Local Application Firewall Ports** in the Admin UI. Any problems accessing the vWAF REST interface can often be resolved by setting this value to a known free port. Contact your support provider if you require any further information.

Authentication

A REST-based management application communicates with a configuration service running on the Admin Server (the Traffic Manager-based service used to provide the Admin UI), so the same security considerations apply:

- REST requests are authenticated using HTTP Basic Auth.
- REST traffic over HTTPS is automatically encrypted using SSL. Traffic over HTTP is not encrypted, so should only be used inside a secure environment or to/from localhost.
- The Traffic Manager Admin Server authenticates itself with its SSL certificate, which is generally self-signed. You might need to ensure that your REST application accepts self-signed certificates, or install a trusted SSL certificate in your Traffic Manager.
- REST requests are authenticated using the same user credentials as defined in the Administration Server. Individual object access is synonymous with page access in the Admin UI. For example, if a user wishes to view and manipulate pool objects, they must have been granted access to pools on the access permissions page.

Supported HTTP Methods

The REST service supports three primary HTTP methods for accessing and modifying data in the Traffic Manager configuration system:

- GET
- PUT
- DELETE

GET is used when making read-only requests for a resource, whereas PUT is used when updating existing data or adding new configuration objects. DELETE is used when you wish to completely remove configuration objects from the Traffic Manager.

Each of these methods is discussed in more detail in the sections that follow.

The REST service additionally supports the POST method for uploading files to the Traffic Manager, specifically with respect to configuration backup TAR archive files. For more information, see [Configuration Backups](#).

Requesting a Resource

A client interacts with the Traffic Manager REST API by performing operations on its resources. An operation is distinguished by the HTTP method it uses and the path and query components of the associated URI. Some operations, however, are not applicable to every resource.

The GET method is used to retrieve the current representation of the resource it is used on. It does not alter the resource in any way or have any other side effects.

This is achieved by sending a HTTP GET request to the server with no body. The request must accept a response in JSON format only (by specifying an "Accept" header type of application/json), and authorization is provided using *HTTP Basic Auth* (for more details, see [Authentication](#)). Such a request resembles the following:

```
GET /api/tm/8.3/config/active/bandwidth/BWClass1 HTTP/1.1
Authorization: Basic YWRtaW46c2Vjc2VjcmV0MTIz
Accept: application/json
```

If successful, the server returns a "200 OK" response code with the full resource in the response body. The above Bandwidth class example might produce the following output:

```
{
  "properties": {
    "basic": {
      "maximum": 10000,
      "note": "This is my bandwidth class",
      "sharing": "cluster"
    }
  }
}
```

This is a JSON structure representing the configuration keys present in the requested bandwidth class object. In this case, it consists of a single "basic" section containing three key:value pairs. Other resource types might contain different or additional sections and corresponding keys.

Setting Configuration for a Resource

This section does not apply to read-only resources such as SNMP counters or system information.

Changing data items in the Traffic Manager configuration system is achieved through a PUT request to a configuration type resource. This applies to either creating new resource items or updating the properties of an existing resource item.

When creating a new resource item, the request URI must contain the full path to the intended item, with the name being the final element of the path. For example, creating a new bandwidth class called "mynewclass" requires using the following URI:

```
/api/tm/8.3/config/active/bandwidth/mynewclass
```

For both creation and update operations, the request body must contain a representation of the resource properties in JSON format (with the appropriate body "Content-Type" header set). Partial updates to configuration resources can be performed by only including the properties that need to be altered. Other properties are left unchanged.

For PUT requests, ensure that the request body is encoded as UTF-8.

The REST service returns a "200 OK" response for a correctly updated configuration set, or "201 Created" for establishing a new configuration object of a particular resource type. In these cases, the full resource is returned as the response body. The only exception to this rule is when updating a raw file, which instead returns a "204 No Content" empty-body response.

You might want to exercise some care when creating or updating resources. The changes are permanent and no warning is given for existing configuration that is overridden. If you attempt to create a new resource where one of the same name already exists, you overwrite the properties of the existing record. It is recommended that you build such validation into your REST client application.

Removing Resources

This section does not apply to read-only resources such as SNMP counters or system information.

A HTTP DELETE request for the full URI of a configuration item can be sent to the REST server to permanently remove it. On success, a "204 No Content" empty-body response is returned.

Further Aspects of the Resource Model

Enumerated Types

Some configuration keys can accept one or more of a pre-defined set of values. This is known as an enumerated key type, and the list of possible values (with long description) is provided in the reference guide later in this document.

Uploading Files

Resources that represent real files (such as TrafficScript rules) can also be presented in a raw format, where the data returned is the contents of the file. The MIME type of the request payload should be set to application/octet-stream.

Custom Configuration Sets

You can store and retrieve arbitrary name:value configuration pairs in the Traffic Manager configuration system using the REST API. This configuration is replicated across your cluster, and is only accessible through the REST API, SOAP API, and ZCLI.

To store a custom configuration, create an instance of the "custom" resource and set your name:value data to the "string_lists" property. For example, to create a resource called "customdata", use the following URI:

```
https://myhost:9070/api/tm/8.3/config/active/custom/customdata
```

Set the request body to a JSON structure resembling the following:

```
{
  "properties": {
    "basic": {
      "string_lists": [{
        "name": "customname1",
        "value": ["val1", "val2"]
      }, {
        "name": "customname2",
        "value": "val3"
      }]
    }
  }
}
```

```
}
```

Using this system, you can organize your custom configuration into logical groups, initially by an instance of the "custom" resource, and within this, by a name:value pair. Each value can itself be a single item or a list of items.

Errors

If the REST server is unable to handle a HTTP request, it returns a HTTP response with an appropriate HTTP error code. The response body is in JSON and contains a data structure describing the error with a unique identifier (separate to the numeric error code) and a description.

The unique identifier is made up of 2 parts:

```
{section}.{error_type}
```

Some errors might provide additional formatted information, specified with an optional "error_info" parameter. For example, the REST API uses this parameter to return per-property errors when a value fails validation. The following structure demonstrates the general form of an error:

```
{
  "error": {
    "error_id":    "{error identifier}",
    "error_text":  "{error description}",
    "error_info": {error specific data structure, optional}
  }
}
```

A validation error occurs when one or more of the properties within a configuration resource fail a validation check. The error_info section then contains a sub-error for each property that failed validation. These sub-errors are like normal errors in that they contain an identifier (error_id) and a human readable text description (error_text):

```
{
  "error": {
    "error_id":    "resource.validation_failed",
    "error_text":  "Some of the properties in the resource failed validation.",
    "error_info": {
      "basic": {
        "key1": {
          "error_id": "num.range",
          "error_text": "Value must be in range 1000 - 2000."
        }
      }
    }
  }
}
```

```
    }  
  }  
}  
}  
}
```

Configuration Backups

The REST service supports the ability to create new backup sets of your Traffic Manager configuration.

When a user creates a new backup in the Admin UI, the Traffic Manager copies the current configuration folder (\$ZEUSHOME/zxtm/conf) into a new backup directory under \$ZEUSHOME/zxtm/confarchive. The name of the backup directory reflects the name chosen in the Admin UI.

Each backup set is saved with a series of metadata files:

Filename	Purpose
DESCRIPTION	Description of the backup
NAME	Optional file containing the name of the backup
VERSION_<version>	File to indicate the software version of the Traffic Manager used to create the backup. This file has no contents.
TIMESTAMP	File indicating when the backup was created.
PARTIAL	Indicates that the backup is a partial backup.

To learn more about configuration backups, see the Pulse Secure Virtual Traffic Manager: User's Guide.

The REST service exposes only the name and description metadata for your backups, although each listed file is still present in a backup archive on the Traffic Manager.

Backups are represented through the REST API as child resources of the System Information resource:

```
/api/tm/8.3/status/<tm>/backups/full
```

As with all System Information resources, you must specify the cluster member you want to interrogate (denoted by <tm> in the URI shown). Each child resource of this URI is named in accordance with the corresponding backup name.

Listing Existing Backups

To see the configuration backups currently stored in a Traffic Manager, perform a GET request for the backups parent resource:

```
/api/tm/8.3/status/<tm>/backups/full
```

If successful, the server returns a "200 OK" response code with the backup list in the response body:

```
{
  "children": [{
    "name": "Backup 1",
    "href": "/api/tm/3.9/status/mytm/backups/full/Backup%201/"
  }, {
    "name": "vTMBBackup-May16",
    "href": "/api/tm/3.9/status/mytm/backups/full/vTMBBackup-May16/"
  }, {
    "name": "another backup",
    "href": "/api/tm/3.9/status/mytm/backups/full/another%20backup/"
  }]
}
```

To observe the metadata for a specific backup, perform a GET request for a child name. For example, a request for `/api/tm/8.3/status/<tm>/backups/full/vTMBBackup-May16` might return the following JSON structure in the response body:

```
{
  "properties": {
    "backup": {
      "description": "Backup for May 2016",
      "time_stamp": 1462445371,
      "version": "21.4"
    }
  }
}
```

Creating a Backup

To create a new backup, use an HTTP PUT request to the backups URI:

```
/api/tm/8.3/status/<tm>/backups/full/<backup_name>
```

Set `<backup_name>` as the name of the backup you want to create.

The request body must contain a JSON resource representing the backup, with an optional description:

```
{
  "properties": {
    "backup": {
      "description": "My vTM backup for today",
    }
  }
}
```

Set the Content-Type header to "application/json".

If your backup request is successful, the Traffic Manager returns a "201 Created" response with the full backup metadata in the response body. If the Traffic Manager cannot create the backup, the response contains an HTTP error and the body contains an explanation of why the backup was unsuccessful.

Make sure your backup name does not already exist. The Traffic Manager does not override existing backups and instead returns an error in the response.

Restoring a Backup

Restoring a backup means your current configuration is overwritten permanently and all unsaved changes are lost. Ivanti strongly recommends only performing the following procedure if you are sure of the results.

To restore a backup to be your current Traffic Manager configuration, send a PUT request with the name of the selected backup in the URI, with a "restore" argument:

```
/api/tm/8.3/status/<tm>/backups/full/MyBackup?restore
```

Set the request body to an empty properties structure, such as the following:

```
{
  "properties":{
  }
}
```

If your restore request is successful, the Traffic Manager returns a "200 OK" response with the backup metadata in the response body. If the Traffic Manager is unable to restore the backup, the response contains an HTTP error and the body contains an explanation of why the operation was unsuccessful.

Downloading Backups

To download a backup as a TAR archive file, perform a GET request with the name of the required backup appended to the base backups URI. For example:

```
/api/tm/8.3/status/<tm>/backups/full/MyBackup
```

Set the "Accept" header to "application/x-tar".

When the request is made, a TAR file will be generated, which will be streamed to the client.

Some backup clients are able to make the request, but cannot properly handle an application/x-tar response. In this case, Ivanti recommends a command line tool such as CURL. The following command is an example of how to download a backup with CURL:

```
curl -H "accept:application/x-tar"  
-u <username>:<password>  
http://<host>:<port>/api/tm/8.3/status/<tm>/backups/full/MyBackup > MyBackup.tar
```

Uploading Backups

To upload a configuration backup file to your Traffic Manager /confarchive directory, use an HTTP POST request to the base backups URI:

```
/api/tm/8.3/status/<tm>/backups/full
```

The name of the backup is not required in the URI; instead, the Traffic Manager uses the contents of the "NAME" file in the backup TAR archive file. Make sure the backup name does not already exist in the Traffic Manager backups list.

Before you send the request, attach your backup archive file and set the Content-Type header to "application/x-tar". The actual process of uploading or attaching the archive file depends on your REST client.

The REST service returns a "201 Created" response for a correctly uploaded configuration backup archive file. If the Traffic Manager is unable to upload the backup file, the response contains an HTTP error and the body contains an explanation of why the operation was unsuccessful.

Deleting Backups

To delete a configuration backup, perform a DELETE request with the full URI of the backup you want to remove. For example, to remove a backup called "MyBackup", use the following URI:

```
/api/tm/8.3/status/<tm>/backups/full/MyBackup
```

If the request is successful, a "204 No Content" empty-body response is returned.

Traffic Manager UI Features

Enabling and Disabling the API

To enable or disable the REST service, click **System > Security > REST API** in the Traffic Manager Admin UI. You can additionally use this page to set the TCP port that the service listens on. The default port is 9070, however any unreserved port can be used here provided it does not conflict with other services already running on the Traffic Manager system. Click **Update** to apply any changes.

ATTENTION

The REST API is currently not available in conjunction with the Traffic Manager's Multi-Site Manager (MSM) feature. Attempts to enable the REST service whilst MSM is operational are denied. Equally, attempting to enable MSM whilst the REST service is running triggers an error. The current state of the Traffic Manager remains unchanged in either of these situations.

To manually restart the REST API service, click **System > Traffic Managers** and then, in the Software Restart section, click **Restart REST API....** The Traffic Manager asks you to confirm the restart on the next screen. Note that any existing connections are lost while the service restarts.

Controlling Timeout Events

The **System > Security > REST API** page provides a number of settings to control how the Traffic Manager responds to certain timeout events that occur through use of the REST API. These are:

Setting	Description
rest!auth_timeout	The timeout period, in seconds, for the REST Authentication cache. As REST does not include the concept of a "session", each request must include user and password credentials. These credentials are validated each time; however, to save requesting repeated external authentications for the same user (from the same IP address), a cache of recent authentications is maintained. This timeout is the maximum amount of time a given user's credentials can stay in the cache.

Setting	Description
	<p>A setting of 0 (zero) disables the cache, forcing every REST request to be authenticated as it is received. However, this affects the performance of the API.</p> <p>(Default: 120 seconds)</p>
rest!replulltime	<p>This is the <i>lull time</i> for configuration replication using REST.</p> <p>This is the time, in seconds, of inactivity through the REST API before configuration replication starts. Increasing this value delays configuration replication among a cluster of Traffic Managers.</p> <p>(Default: 5 seconds)</p>
rest!repabstime	<p>This is the absolute timeout prior to configuration replication using REST.</p> <p>This is the longest time, in seconds, before configuration replication using REST starts, regardless of activity through the API.</p> <p>(Default: 20 seconds)</p>
rest!reptimeout	<p>The configuration replication duration timeout using REST.</p> <p>This is the time, in seconds, allowed for the process of configuration replication to complete. On a system with slow cluster communications or a very large configuration, increasing this value improves replication reliability.</p> <p>(Default: 10 seconds)</p>

Configuring the IP Addresses That the REST API Listens On

System > Security > REST API contains a setting, rest!bindips, that can be used to control the IP address(es) that the REST API listens on for connections. This can be a space-separated or comma-separated list of IPv4 or IPv6 addresses. Alternatively, it can contain an entry of "*", in which case the REST API listens on all IP addresses.

If you configure the Traffic Manager to use a management IP address during initial configuration, `rest!bindips` defaults to this same IP address. You can, however, override this later with a separate IP address or list of IP addresses specific to the REST API.

ATTENTION

`rest!bindips` is a machine-specific setting and is not included in the cluster configuration that is replicated out to joining Traffic Manager instances. If you intend to join an unrestricted Traffic Manager into a cluster that has been previously configured to use a management IP address, you must ensure `rest!bindips` is set on the new instance before you join the cluster to avoid exposing unintended access.

The addresses that are bound to are listed in the error log. Addresses to which the REST API cannot be bound are also logged. If no addresses can be bound, the REST API shuts down.

Restricting Access to Trusted Users

In addition to username/password access, click **System > Security > Restricting Access** to further restrict access to the administrative capabilities of your Traffic Manager system to a set of trusted IP addresses, CIDR subnets, or DNS wildcards. Access to the REST API is also affected by this capability.

Log Messages in the Traffic Manager

The Event Log

A number of specific API-related messages might be found in the Traffic Manager event log under certain conditions:

- "REST API started: https://<URI>"
Raised when the REST Daemon starts.
- "REST API is shutting down"
Raised when the REST Daemon closes down.
- "On IPv6 host but cannot set unspecified ip address to ::"
Raised when the REST Daemon can't set itself up to listen on the IPv6 wildcard address.
- "Could not open Traffic Manager PID file for read: <error>"

Raised when REST Daemon can't identify the Traffic Manager PID, and so can't signal it to reload its config after a change has been made via the REST API.

- "Could not open Traffic Manager PID file: <error>"

Raised when REST Daemon can't identify the Traffic Manager PID, and so can't signal it to reload its config after a change has been made via the REST API.

- "Failed to write to audit log: <error>"

Raised when the REST Daemon can't add lines to the audit log.

The Audit Log

The audit log records login attempts, configuration changes, and user logouts. It also records changes made using the Traffic Manager Control API, and through the Traffic Manager Command-Line Interface (CLI). Configuration changes made through the REST API follow the same behavior.

In addition to the typical configuration messages entered into the audit log, the Traffic Manager also provides the ability to track user activity in the REST API. It does this by grouping REST request/response exchanges made in close succession from a given user into a "session".

The Traffic Manager logs the first request in a group of one or more requests from a particular user/ip address combination in the audit log as a "session start". Requests received after the initial request are deemed to be part of the same user session. Then, after a specified timeout interval since the most recent request was received from the same user, a "session end" is logged.

Examples and Use-Cases

This chapter provides examples and use-cases for the REST API.

Typical Usage

ATTENTION

The following examples are developed to work with version 8.3 of the Traffic Manager REST API. Ivanti makes no warranty as to their suitability for older versions.

The following code samples demonstrate how to interact with the REST API for a variety of purposes. The examples are based on Perl using the "REST::Client" module to handle the connections to the Traffic Manager REST daemon.

For further information on REST::Client, see the CPAN Web site: www.cpan.org.

A typical Perl client connection might resemble the following:

```
#!/usr/bin/perl

use REST::Client;
use strict;

# Set up the connection
my $client = REST::Client->new();
$client->setHost( 'https://myhost:9070' );
$client->addHeader( 'Authorization', 'Basic YWRtaW46am9iYmll' );
$client->addHeader( 'Content-Type', 'application/json' );

# Perform a HTTP GET on this URI
$client->GET( '/api/tm/8.3/config/active' );

# Print out the response body
print $client->responseContent();
```

In the above example, a new connection is established to the REST service on the Traffic Manager "myhost" on port 9070.

The setHost() function allows us to set up a definitive hostname and port to which all requests are made. This is an optional feature, and the full hostname can be supplied when making the actual request if multiple hosts are required.

Two HTTP headers can be added here, one to provide Basic Auth authentication and the other to provide a declaration of the Content Type when making PUT requests. In the majority of cases, the content type is "application/json", apart from transactions involving raw files where it is necessary to use "application/octet-stream".

A GET request is sent to the REST service with a target of the resource URI as the supplied argument. Typically, the above script outputs a JSON structure showing the Traffic Manager resource tree at the top level:

```
{
  "children": [{
    "name": "rules",
    "href": "/api/tm/8.3/config/active/rules/"
  }, {
    "name": "actions",
    "href": "/api/tm/8.3/config/active/actions/"
  },
  ...
  (truncated)
  ...
  {
    "name": "auth",
    "href": "/api/tm/8.3/config/active/auth/"
  }
  ]
}
```

Each of the following examples make use of a further Perl module "JSON" in order to encode and decode between the JSON string used by REST::Client and a native Perl structure. This is done to simplify the parsing algorithm within the script. Further information regarding the JSON Perl module can be found at the CPAN Web site: www.cpan.org.

Listing Running Virtual Servers

In this example, we collect data on stored virtual servers by querying the "vservers" resource and identifying which ones are enabled (running).

The code structure is as follows:

- Instantiate a new REST Client object.
- Specify the hostname and port of the REST service to which all requests are to be directed.

- Add required HTTP headers for authentication and content type.
- Send a GET request for the “vservers” resource in order to return a list of all Virtual Servers on the system.
- Check the response body, and decode from JSON into a Perl structure. This value is a hash ref.
- Identify the “children” hash key, and iterate through the array to which it points.
- Each array item contains a hash of “name” and “href” associative values.
- Using the “name” value, perform a new GET request to return the full configuration for this named virtual server resource.
- Again, using the decoded JSON response body, identify the Boolean value of the “enabled” key in the “basic” configuration section. If it is “true”, this virtual server is running so print it’s name to STDOUT.

ATTENTION

This script does not contain any error checking in order to best demonstrate the basic functionality. It is strongly recommended you incorporate return value checking and other validation mechanisms as appropriate.

```
#!/usr/bin/perl

use REST::Client;
use JSON;
use strict;

# Set up the connection
my $client = REST::Client->new();
$client->setHost( 'https://myhost:9070' );
$client->addHeader( 'Authorization', 'Basic YWRtaW46am9iYmll' );
$client->addHeader( 'Content-Type', 'application/json' );

# Request a list of all virtual servers
$client->GET( '/api/tm/8.3/config/active/vservers' );

# Decode response into a perl structure for easy parsing
my $response = decode_json( $client->responseContent() );

# Obtain a reference to the children array
my $vsArrayRef = $response->{children};
```

```
# For each VS, make a request for its configuration and
# check the Boolean value of the 'enabled' key
foreach my $vs ( @$vsArrayRef ) {
    my $vsName = $vs->{name};
    $client->GET( "/api/tm/8.3/config/active/vservers/$vsName" );
    my $vsConfig = decode_json( $client->responseContent() );
    if( $vsConfig->{properties}->{basic}->{enabled} eq "true" ) {
        # Print the name of this matched VS
        print "$vsn\n";
    }
}
```

The expected output of a script such as this would be:

```
$ ./listVS.pl
Main Website
Intranet
Support Site
```

Adding a Node to a Pool

Provisioning systems can dynamically deploy applications across servers, perhaps in reaction to increased server load. This example demonstrates an application that modifies the nodes that a pool balances traffic to.

The code structure is as follows:

- Instantiate a new REST Client object.
- Specify the hostname and port of the REST service to which all requests are to be directed.
- Add required HTTP headers for authentication and content type.
- Send a GET request for the pool that the new node is added to. Check the response body, and decode from JSON into a Perl structure. This value is a hash ref.
- The new node must be added to the table of existing nodes before writing the data back to the pool resource. Failing to do this results in the existing table being overwritten with a single row containing the new node. Each of the subkeys associated with the node have default values and do not need to be specified.

- Re-encode the Perl structure into JSON and pass as an argument to the PUT request (using the pool name URI as the target).
- In this example, the script performs a check on the response code to ensure any problems are reported back (where the response code is not 200 OK).
- There is an optional portion of code at the end to iterate through the stored node table to ensure that the new node name appears.

```
#!/usr/bin/perl -w

use REST::Client;
use JSON;
use strict;

# Set up the connection
my $client = REST::Client->new();
$client->setHost( 'http://localhost:9070' );
$client->addHeader( 'Authorization', 'Basic YWRtaW46am9iYmll' );
$client->addHeader( 'Content-Type', 'application/json' );

# Our pool and new node details
my $poolName = "WebPool";
my $newNode = { "node" => "www3.pulsesecure.net:80" };

# Get the config for the pool in question
$client->GET( "/api/tm/8.3/config/active/pools/$poolName" );
my $poolConfig = decode_json( $client->responseContent() );

# Find the existing nodes table (a hashref), and add our new node
my $nodesRef = $poolConfig->{properties}->{basic}->{nodes_table};
push @$nodesRef, $newNode;

# Re-encode as a JSON string
my $poolStr = encode_json( $poolConfig );

# Now send a PUT request to the REST service
$client->PUT( "/api/tm/8.3/config/active/pools/$poolName",
            $poolStr );

# Print out the response code if we were NOT successful
if( $client->responseCode() ne '200' ) {
```

```
        die "FAILED with HTTP code: " . $client->responseCode();
    }

    # We're done! Verify that the node has been added
    $client->GET( "/api/tm/8.3/config/active/pools/$poolName" );
    $poolConfig = decode_json( $client->responseContent() );
    print "Stored nodes for pool '$poolName':\n";
    foreach my $tablerow ( @{$poolConfig->{properties}->{basic}->{nodes_table}} ) {
        print "$tablerow->{node}\n";
    }
}
```

The expected output of a script such as this would be:

```
$ ./addNode.pl
Stored nodes for pool 'WebPool':
www1.pulsesecure.net:80
www2.pulsesecure.net:80
www3.pulsesecure.net:80
```

Resource Model Reference

This chapter provides a complete reference listing for the Traffic Manager REST API resource model.

About the Resource Model Reference

This chapter lists all the configuration, counter, and information resources available through the REST API model.

Each section relates to a specific resource and lists its name, description, unique URI path, and a table of properties.

For each property, you can find the description and data type. Additional information is provided where applicable, such as default value, permitted values (for enumerated types), and SNMP counter name. For Table-type properties, a list of the Primary and Sub keys is provided.

The path to use in your URIs is listed for each resource. For example, the URI path for a virtual server configuration resource is "virtual_servers", so to address a stored virtual server named "foo", you would use:

```
/api/tm/8.3/config/active/virtual_servers/foo
```

Getting Information About the Structure of Resources

To obtain information about the structure of resources through the REST API itself, use the "metadata" query string argument with any request URI. For example:

```
https://<host>:<port>/api/tm/8.3/config/active/virtual_servers?metadata
https://<host>:<port>/api/tm/8.3/config/active/virtual_servers/foo?metadata
https://<host>:<port>/api/tm/8.3/status/local_tm/statistics/pools/mypool?metadata
https://<host>:<port>/api/tm/8.3/status/myvtm/state?metadata
```

You can append ?metadata to a resource type ("/virtual_servers") or to an instance of a resource ("/virtual_servers/foo"). The Traffic Manager returns the relevant details in a "metadata" element in the JSON response. For example:

```
"metadata":{
  "description": "description of the resource",
  "properties": {
    "sectionA": {
      "property1": {
```

```

        "description": "description of property1",
        "type": "property type",
        "default": <default value>
    }
}
}
}

```

The response contains resource level metadata, along with a "properties" element. This follows the same structure as a typical "properties" element, with sections and properties. All properties contain values for the "description", "type", and "default" value. The default value matches the type of the property.

Configuration Resources

Action Program

URI Endpoint: /api/tm/8.3/config/active/action_programs

This is a program or script that can be referenced and used by actions of type 'Program'

Property	Description
There are no properties to display for this resource.	

Admin SSL Trusted Certificate

URI Endpoint: /api/tm/8.3/config/active/ssl/admin_cas

The conf/ssl/admin_cas directory contains SSL certificate authority certificates (CAs) and certificate revocation lists (CRLs) which can be used when validating connections made by the admin server for user authentication. CAs and CRLs can be managed under the Catalogs > SSL > Admin CAs and CRLs section of the Admin Server UI or by using functions under the Catalog.SSL.AdminCertificateAuthorities section of the SOAP API and CLI.

Property	Description
There are no properties to display for this resource.	

Alerting Action

URI Endpoint: /api/tm/8.3/config/active/actions

A response to an event occurring in your traffic manager. An example of an action might be sending an email or writing a line to a log file.

Property	Description
note	<p>A description of the action.</p> <ul style="list-style-type: none">Type: FreeformStringRequired: falseDefault value: <none>
syslog_msg_len_limit	<p>Maximum length in bytes of a message sent to the remote syslog. Messages longer than this will be truncated before they are sent.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "2048"
timeout	<p>How long the action can run for before it is stopped automatically (set to 0 to disable timeouts).</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "60"
type	<p>The action type.</p> <ul style="list-style-type: none">Type: Enum(String)Required: trueDefault value: <none>Permitted values: "email": E-Mail

Property	Description
	"log": Log to File "program": Program "soap": SOAP Callback "syslog": Log to Syslog "trap": SNMP Notify or Trap
verbose	Enable or disable verbose logging for this action. <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
Properties for the "email" section:	
from	The e-mail address from which messages will appear to originate. <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "vTM@%hostname%"
server	The SMTP server to which messages should be sent. This must be a valid IPv4 address or resolvable hostname (with optional port). <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
to	A set of e-mail addresses to which messages will be sent. <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>

Property	Description
Properties for the "log" section:	
file	<p>The full path of the file to log to. The text %zeushome% will be replaced with the location where the software is installed.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
Properties for the "program" section:	
arguments	<p>A table containing arguments and argument values to be passed to the event handling program.</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• name (String): The name of the argument to be passed to the event handling program. (Required)• Sub keys:<ul style="list-style-type: none">• value (String): The value of the argument to be passed to the event handling program. (Required)• description (String): A description for the argument provided to the program.
program	<p>The program to run.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
Properties for the "soap" section:	
additional_data	Additional information to send with the SOAP call.

Property	Description
	<ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
password	<p>The password for HTTP basic authentication.</p> <ul style="list-style-type: none">Type: PasswordRequired: falseDefault value: <none>
proxy	<p>The address of the server implementing the SOAP interface (For example, https://example.com).</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
username	<p>Username for HTTP basic authentication. Leave blank if you do not wish to use authentication.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
Properties for the "syslog" section:	
sysloghost	<p>The host and optional port to send syslog messages to (if empty, messages will be sent to localhost).</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
Properties for the "trap" section:	

Property	Description
auth_password	<p>The authentication password for sending a Notify over SNMPv3. Blank to send unauthenticated traps.</p> <ul style="list-style-type: none">Type: PasswordRequired: falseDefault value: <none>
community	<p>The community string to use when sending a Trap over SNMPv1 or a Notify over SNMPv2c.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
hash_algorithm	<p>The hash algorithm for SNMPv3 authentication.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "md5"Permitted values: "md5": MD5 "sha1": SHA-1
priv_password	<p>The encryption password to encrypt a Notify message for SNMPv3. Requires that authentication also be configured. Blank to send unencrypted traps.</p> <ul style="list-style-type: none">Type: PasswordRequired: falseDefault value: <none>
traphost	<p>The hostname or IPv4 address and optional port number that should receive traps.</p>

Property	Description
	<ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
username	<p>The SNMP username to use to send the Notify over SNMPv3.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
version	<p>The SNMP version to use to send the Trap/Notify.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "snmpv1"Permitted values:<ul style="list-style-type: none">"snmpv1": SNMPv1"snmpv2c": SNMPv2c"snmpv3": SNMPv3

Aptimizer Application Scope

URI Endpoint: /api/tm/8.3/config/active/aptoptimizer/scopes

Application scopes define criteria that match URLs to specific logical web applications hosted by a virtual server.

Property	Description
canonical_hostname	If the hostnames for this scope are aliases of each other, the canonical hostname will be used for requests to the server.

Property	Description
	<ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
hostnames	<p>The hostnames to limit acceleration to.</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>
root	<p>The root path of the application defined by this application scope.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "/"

BGP Neighbor

URI Endpoint: /api/tm/8.3/config/active/bgpneighbors

The conf/bgpneighbors directory contains configuration files for BGP neighbors. The name of a file is the name of the neighbor configuration that it defines. BGP neighbors can be managed under the System > Fault Tolerance > BGP Neighbors section of the Admin UI, or by using functions under the BGPNeighbors section of the SOAP API and CLI.

Property	Description
address	<p>The IP address of the BGP neighbor</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>

Property	Description
advertisement_interval	<p>The minimum interval between the sending of BGP routing updates to neighbors. Note that as a result of jitter, as defined for BGP, the interval during which no advertisements are sent will be between 75% and 100% of this value.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "5"
as_number	<p>The AS number for the BGP neighbor</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "65534"
authentication_password	<p>The password to be used for authentication of sessions with neighbors</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
holdtime	<p>The period after which the BGP session with the neighbor is deemed to have become idle - and requires re-establishment - if the neighbor falls silent.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "90"
keepalive	<p>The interval at which messages are sent to the BGP neighbor to keep the mutual BGP session established.</p> <ul style="list-style-type: none">Type: UInt

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: "30"
machines	<p>The traffic managers that are to use this neighbor</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>

Bandwidth Class

URI Endpoint: /api/tm/8.3/config/active/bandwidth

A Bandwidth class, which can be assigned to a virtual server or pool in order to limit the number of bytes per second used by inbound or outbound traffic.

Property	Description
maximum	<p>The maximum bandwidth to allocate to connections that are associated with this bandwidth class (in kbits/second).</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "10000"
note	<p>A description of this bandwidth class.</p> <ul style="list-style-type: none">• Type: FreeformString• Required: false• Default value: <none>
sharing	<p>The scope of the bandwidth class.</p> <ul style="list-style-type: none">• Type: Enum(String)

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: "cluster"Permitted values:<ul style="list-style-type: none">"cluster": Bandwidth is shared across all traffic managers"connection": Each connection can use the maximum rate"machine": Bandwidth is shared per traffic manager

Cloud Credentials

URI Endpoint: /api/tm/8.3/config/active/cloud_api_credentials

Cloud credentials used in cloud API calls

Property	Description
api_server	<p>The vCenter server hostname or IP address.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
cloud_api_timeout	<p>The traffic manager creates and destroys nodes via API calls. This setting specifies (in seconds) how long to wait for such calls to complete.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "200"

Property	Description
cred1	<p>The first part of the credentials for the cloud user. Typically this is some variation on the username concept.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
cred2	<p>The second part of the credentials for the cloud user. Typically this is some variation on the password concept.</p> <ul style="list-style-type: none">• Type: Password• Required: false• Default value: <none>
cred3	<p>The third part of the credentials for the cloud user. Typically this is some variation on the authentication token concept.</p> <ul style="list-style-type: none">• Type: Password• Required: false• Default value: <none>
script	<p>The script to call for communication with the cloud API.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
update_interval	<p>The traffic manager will periodically check the status of the cloud through an API call. This setting specifies the interval between such updates.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "30"

Custom configuration set

URI Endpoint: /api/tm/8.3/config/active/custom

Custom configuration sets store arbitrary named values. These values can be read by SOAP or REST clients.

Property	Description
string_lists	<p>This table contains named lists of strings</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• name (String): Name of list (Required)• Sub keys:<ul style="list-style-type: none">• value (List(String)): Named list of user-specified strings. (Required)

DNS Zone

URI Endpoint: /api/tm/8.3/config/active/dns_server/zones

The conf/dnsserver/zones/ file contains zone metadata

Property	Description
origin	<p>The domain origin of this Zone.</p> <ul style="list-style-type: none">• Type: String• Required: true• Default value: <none>
zonefile	<p>The Zone File encapsulated by this Zone.</p> <ul style="list-style-type: none">• Type: String

Property	Description
	<ul style="list-style-type: none">Required: trueDefault value: <none>

DNS Zone File

URI Endpoint: /api/tm/8.3/config/active/dns_server/zone_files

The conf/dnsserver/zonefiles/ directory contains files that define DNS zones.

Property	Description
There are no properties to display for this resource.	

Event Type

URI Endpoint: /api/tm/8.3/config/active/event_types

Configuration that ties actions to a set of events that trigger them.

Property	Description
actions	<p>The actions triggered by events matching this event type, as a list of action references.</p> <ul style="list-style-type: none">Type: List(Reference(config-event-action))Required: falseDefault value: <none>
built_in	<p>If set to Yes this indicates that this configuration is built-in (provided as part of the software) and must not be deleted or edited.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false

Property	Description
note	<p>A description of this event type.</p> <ul style="list-style-type: none">Type: FreeformStringRequired: falseDefault value: <none>
Properties for the "cloudcredentials" section:	
event_tags	<p>Cloud credentials event tags</p> <ul style="list-style-type: none">Type: List(String)Required: falseDefault value: <none>
objects	<p>Cloud credentials object names</p> <ul style="list-style-type: none">Type: List(String)Required: falseDefault value: <none>
Properties for the "config" section:	
event_tags	<p>Configuration file event tags</p> <ul style="list-style-type: none">Type: List(String)Required: falseDefault value: <none>
Properties for the "faulttolerance" section:	
event_tags	<p>Fault tolerance event tags</p> <ul style="list-style-type: none">Type: List(String)Required: falseDefault value: <none>

Property	Description
Properties for the "general" section:	
event_tags	<p>General event tags</p> <ul style="list-style-type: none">• Type: List(String)• Required: false• Default value: <none>
Properties for the "glb" section:	
event_tags	<p>GLB service event tags</p> <ul style="list-style-type: none">• Type: List(String)• Required: false• Default value: <none>
objects	<p>GLB service object names</p> <ul style="list-style-type: none">• Type: List(String)• Required: false• Default value: <none>

Extra File

URI Endpoint: /api/tm/8.3/config/active/extra_files

A user-uploaded file. Such files can be used in TrafficScript code using the resource.get function.

Property	Description
There are no properties to display for this resource.	

GLB Service

URI Endpoint: /api/tm/8.3/config/active/glb_services

A global load balancing service is used by a virtual server to modify DNS requests in order load balance data across different GLB locations.

Property	Description
algorithm	<p>Defines the global load balancing algorithm to be used.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "hybrid"Permitted values: <p>"chained": Sends traffic to one location at a time, until that location fails where the next one in the chain is used.</p> <p>"geo": Distributes traffic based solely on the geographic location of each client.</p> <p>"hybrid": Distribute traffic based on both the load and geographic location.</p> <p>"load": Distributes traffic based on the current load to each location.</p>

Property	Description
	<p>"round_robin": Distributes traffic by assigning each request to a new location in turn. Over a period of time, all locations will receive the same number of requests.</p> <p>"weighted_random": Distributes traffic in a random way, but according to a weighted policy defined by individual location weights</p>
all_monitors_needed	<p>Do all monitors assigned to a location need to report success in order for it to be considered healthy?</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
autorecovery	<p>The last location to fail will be available as soon as it recovers.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
chained_auto_failback	<p>Enable/Disable automatic failback mode.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
chained_location_order	<p>The locations this service operates for and defines the order in which locations fail.</p> <ul style="list-style-type: none">• Type: List(String)• Required: false• Default value: <none>

Property	Description
disable_on_failure	<p>Locations recovering from a failure will become disabled.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
dnssec_keys	<p>A table mapping domains to the private keys that authenticate them</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• domain (String): A domain authenticated by the associated private keys. (Required)• Sub keys:<ul style="list-style-type: none">• ssl_key (Set(String)): Private keys that authenticate the associated domain. (Required)
domains	<p>The domains shown here should be a list of Fully Qualified Domain Names that you would like to balance globally. Responses from the back end DNS servers for queries that do not match this list will be forwarded to the client unmodified. Note: "*" may be used as a wild card.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
enabled	<p>Enable/Disable our response manipulation of DNS.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false

Property	Description
geo_effect	<p>How much should the locality of visitors affect the choice of location used? This value is a percentage, 0% means that no locality information will be used, and 100% means that locality will always control which location is used. Values between the two extremes will act accordingly.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "50"
last_resort_response	<p>The response to be sent in case there are no locations available.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
location_draining	<p>This is the list of locations for which this service is draining. A location that is draining will never serve any of its service IP addresses for this domain. This can be used to take a location off-line.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
location_settings	<p>Table containing location specific settings.</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• location (String): Location to which the associated settings apply. (Required)• Sub keys:

Property	Description
	<ul style="list-style-type: none">weight (UInt): Weight for this location, for use by the weighted random algorithm.ips (Set(String)): The IP addresses that are present in a location. If the Global Load Balancer decides to direct a DNS query to this location, then it will filter out all IPs that are not in this list. (Required)monitors (Set(String)): The monitors that are present in a location.
return_ips_on_fail	<p>Return all or none of the IPs under complete failure.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
rules	<p>Response rules to be applied in the context of the service, in order, comma separated.</p> <ul style="list-style-type: none">Type: List(Reference(config-trafficscript))Required: falseDefault value: <none>
ttl	<p>The TTL for the DNS resource records handled by the GLB service.</p> <ul style="list-style-type: none">Type: IntRequired: falseDefault value: "-1"
Properties for the "log" section:	
enabled	<p>Log connections to this GLB service?</p> <ul style="list-style-type: none">Type: BooleanRequired: false

Property	Description
	<ul style="list-style-type: none">Default value: false
filename	<p>The filename the verbose query information should be logged to. Appliances will ignore this.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "%zeushome%/zxtm/log/services/%g.log"
format	<p>The format of the log lines.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "%t, %s, %l, %q, %g, %n, %d, %a"

Global Settings

URI Endpoint: /api/tm/8.3/config/active/global_settings

General settings that apply to every machine in the cluster.

Property	Description
accepting_delay	<p>How often, in milliseconds, each traffic manager child process (that isn't listening for new connections) checks to see whether it should start listening for new connections.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "50"
afm_enabled	<p>Is the application firewall enabled.</p> <ul style="list-style-type: none">Type: BooleanRequired: false

Property	Description
	<ul style="list-style-type: none">• Default value: false
chunk_size	<p>The default chunk size for reading/writing requests.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "16384"
client_first_opt	<p>Whether or not your traffic manager should make use of TCP optimisations to defer the processing of new client-first connections until the client has sent some data.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
cluster_identifier	<p>Cluster identifier. Generally supplied by Services Director.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
license_servers	<p>A list of license servers for FLA licensing. A license server should be specified as a <ip/host>:<port> pair.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
max_fds	<p>The maximum number of file descriptors that your traffic manager will allocate.</p> <ul style="list-style-type: none">• Type: UInt• Required: false

Property	Description
	<ul style="list-style-type: none">Default value: "1048576"
max_tcp_buff_mem	<p>The maximum amount of memory allowed to be used to buffer network data in user space for all TCP connections. The TCP data buffered are either received from clients but before sending to pool nodes, or received from pool nodes but before sending to clients. This is specified as either a percentage of system RAM, 5% for example, or an absolute size such as 1024MB and 2GB. A numeric value without suffix MB, GB or % defaults to MB. A value of 800 means 800MB. A value of 0 means unlimited.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
monitor_memory_size	<p>The maximum number of each of nodes, pools or locations that can be monitored. The memory used to store information about nodes, pools and locations is allocated at start-up, so the traffic manager must be restarted after changing this setting.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "4096"
rate_class_limit	<p>The maximum number of Rate classes that can be created. Approximately 100 bytes will be pre-allocated per Rate class.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "25000"
shared_pool_size	<p>The size of the shared memory pool used for shared storage across worker processes (e.g. bandwidth shared data). This is specified as either a percentage of system RAM, 5% for example, or an absolute size such as 10MB.</p>

Property	Description
	<ul style="list-style-type: none">Type: StringRequired: falseDefault value: "10MB"
slm_class_limit	<p>The maximum number of SLM classes that can be created. Approximately 100 bytes will be pre-allocated per SLM class.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "1024"
so_rbuff_size	<p>The size of the operating system's read buffer. A value of 0 (zero) means to use the OS default; in normal circumstances this is what should be used.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>

enabled	<p>Export metadata about transactions processed by the traffic manager to an external location.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
endpoint	<p>The endpoint to which transaction metadata should be exported. The endpoint is specified as a hostname or IP address with a port.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
tls	<p>Whether the connection to the specified endpoint should be encrypted.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
tls_verify	<p>Whether the server certificate presented by the endpoint should be verified, preventing a connection from being established if the certificate does not match the server name, is self-signed, is expired, is revoked, or has an unknown CA.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
Properties for the "watchdog" section:	
timeout	<p>The maximum time in seconds a process can fail to update its heartbeat, before the watchdog considers it to have stalled.</p>

Property	Description
	<ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "5"
Properties for the "web_cache" section:	
avg_path_length	<p>The estimated average length of the path (including query string) for resources being cached. An amount of memory equal to this figure multiplied by max_file_num will be allocated for storing the paths for cache entries. This setting can be increased if your web site makes extensive use of long URLs.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "512"
disk	<p>Whether or not to use a disk-backed (typically SSD) cache. If set to Yes cached web pages will be stored in a file on disk. This enables the traffic manager to use a cache that is larger than available RAM. The size setting should also be adjusted to select a suitable maximum size based on your disk space. Note that the disk caching is optimized for use with SSD storage.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
disk_dir	<p>If disk caching is enabled, this sets the directory where the disk cache file will be stored. The traffic manager will create a file called webcache.data in this location. Note that the disk caching is optimized for use with SSD storage.</p> <ul style="list-style-type: none">• Type: String• Required: false

Property	Description
	<ul style="list-style-type: none">Default value: "%zeushome%/zxtm/internal"
max_file_num	<p>Maximum number of entries in the cache. Approximately 0.9 KB will be pre-allocated per entry for metadata, this is in addition to the memory reserved for the content cache and for storing the paths of the cached resources.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10000"
max_file_size	<p>Largest size of a cacheable object in the cache. This is specified as either a percentage of the total cache size, 2% for example, or an absolute size such as 20MB.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "2%"
max_path_length	<p>The maximum length of the path (including query string) for the resource being cached. If the path exceeds this length then it will not be added to the cache.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "2048"
normalize_query	<p>Enable normalization (lexical ordering of the parameter-assignments) of the query string.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true

Property	Description
size	<p>The maximum size of the HTTP web page cache. This is specified as either a percentage of system RAM, 20% for example, or an absolute size such as 200MB.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: "20%"
verbose	<p>Add an X-Cache-Info header to every HTTP response, showing whether the request and/or the response was cacheable.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false

Kerberos Configuration File

URI Endpoint: /api/tm/8.3/config/active/kerberos/krb5confs

A Kerberos krb5.conf file that provides the raw configuration for a Kerberos principal.

Property	Description
There are no properties to display for this resource.	

Kerberos Keytab

URI Endpoint: /api/tm/8.3/config/active/kerberos/keytabs

A Kerberos keytab file contains credentials to authenticate as (a number of) Kerberos principals.

Property	Description
There are no properties to display for this resource.	

Kerberos Principal

URI Endpoint: /api/tm/8.3/config/active/kerberos/principals

A Kerberos principal can be used by the traffic manager to participate in a Kerberos realm.

Property	Description
kdcs	<p>A list of <hostname/ip>:<port> pairs for Kerberos key distribution center (KDC) services to be explicitly used for the realm of the principal. If no KDCs are explicitly configured, DNS will be used to discover the KDC(s) to use.</p> <ul style="list-style-type: none">Type: List(String)Required: falseDefault value: <none>
keytab	<p>The name of the Kerberos keytab file containing suitable credentials to authenticate as the specified Kerberos principal.</p> <ul style="list-style-type: none">Type: StringRequired: trueDefault value: <none>
krb5conf	<p>The name of an optional Kerberos configuration file (krb5.conf).</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
realm	<p>The Kerberos realm where the principal belongs.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
service	<p>The service name part of the Kerberos principal name the traffic manager should use to authenticate itself.</p>

Property	Description
	<ul style="list-style-type: none">Type: StringRequired: trueDefault value: <none>

License

URI Endpoint: /api/tm/8.3/config/active/license_keys

A license key is an encoded text file that controls what functionality is available from each traffic manager in the cluster. Every production traffic manager must have a valid licence key in order to function; a traffic manager without a license will operate as Community Edition, which provides most of the functionality, but places restrictions on bandwidth and cluster size.

Property	Description
There are no properties to display for this resource.	

Location

URI Endpoint: /api/tm/8.3/config/active/locations

These are geographic locations as used by Global Load Balancing services. Such a location may not necessarily contain a traffic manager; instead it could refer to the location of a remote datacenter.

Property	Description
id	<p>The identifier of this location.</p> <ul style="list-style-type: none">Type: UIntRequired: trueDefault value: <none>
latitude	<p>The latitude of this location.</p> <ul style="list-style-type: none">Type: Float

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: "0.0"
longitude	<p>The longitude of this location.</p> <ul style="list-style-type: none">• Type: Float• Required: false• Default value: "0.0"
note	<p>A note, used to describe this location.</p> <ul style="list-style-type: none">• Type: FreeformString• Required: false• Default value: <none>
type	<p>Does this location contain traffic managers and configuration or is it a recipient of GLB requests?</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "config"• Permitted values:<ul style="list-style-type: none">"config": Configuration"glb": GLB

Log Export

URI Endpoint: /api/tm/8.3/config/active/log_export

Definitions of log files which should be exported to the analytics engine

Property	Description
appliance_only	<p>Whether entries from the specified log files should be exported only from appliances.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
enabled	<p>Export entries from the log files included in this category.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
files	<p>The set of files to export as part of this category, specified as a list of glob patterns.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
history	<p>How much historic log activity should be exported.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "none"• Permitted values:<ul style="list-style-type: none">"all": Export all historic entries"none": Do not export any historic entries"recent": Export recent historic entries, according to the 'history_period' setting
history_period	<p>The number of days of historic log entries that should be exported.</p>

Property	Description
	<ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
metadata	<p>This is table 'metadata'</p> <ul style="list-style-type: none">Type: TableRequired: falsePrimary key:<ul style="list-style-type: none">name (String): The name of a metadata item which should be sent to the analytics engine along with entries from these log files. (Required)Sub keys:<ul style="list-style-type: none">value (String): Additional metadata to include with the log entries when exporting them to the configured endpoint. Metadata can be used by the system that is receiving the exported data to categorise and parse the log entries. (Required)
note	<p>A description of this category of log files.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>

Monitor

URI Endpoint: /api/tm/8.3/config/active/monitors

Monitors check important remote services are running, by periodically sending them traffic and checking the response is correct. They are used by virtual servers to detect the failure of backend nodes.

Property	Description
back_off	<p>Should the monitor slowly increase the delay after it has failed?</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
delay	<p>The minimum time between calls to a monitor.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "3"
failures	<p>The number of times in a row that a node must fail execution of the monitor before it is classed as unavailable.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "3"
health_only	<p>Should this monitor only report health (ignore load)?</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
machine	<p>The machine to monitor, where relevant this should be in the form <hostname>:<port>, for "ping" monitors the :<port> part must not be specified.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
note	<p>A description of the monitor.</p>

Property	Description
	<ul style="list-style-type: none">Type: FreeformStringRequired: falseDefault value: <none>
scope	<p>A monitor can either monitor each node in the pool separately and disable an individual node if it fails, or it can monitor a specific machine and disable the entire pool if that machine fails. GLB location monitors must monitor a specific machine.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "pernode"Permitted values:<ul style="list-style-type: none">"pernode": Node: Monitor each node in the pool separately"poolwide": Pool/GLB: Monitor a specified machine
timeout	<p>The maximum runtime for an individual instance of the monitor.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "3"
type	<p>The internal monitor implementation of this monitor.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "ping"Permitted values:

Property	Description
	<p>"connect": TCP Connect monitor</p> <p>"http": HTTP monitor</p> <p>"ping": Ping monitor</p> <p>"program": External program monitor</p> <p>"rtsp": RTSP monitor</p> <p>"sip": SIP monitor</p> <p>"tcp_transaction": TCP transaction monitor</p>
use_ssl	<p>Whether or not the monitor should connect using SSL.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
verbose	<p>Whether or not the monitor should emit verbose logging. This is useful for diagnosing problems.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
Properties for the "http" section:	
authentication	<p>The HTTP basic-auth <user>:<password> to use for the test HTTP request.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>

Property	Description
body_regex	<p>A regular expression that the HTTP response body must match. If the response body content doesn't matter then set this to .* (match anything).</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
host_header	<p>The host header to use in the test HTTP request.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
path	<p>The path to use in the test HTTP request. This must be a string beginning with a / (forward slash).</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: "/"
status_regex	<p>A regular expression that the HTTP status code must match. If the status code doesn't matter then set this to .* (match anything).</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: "^ [234][0-9][0-9]\$"
Properties for the "rtsp" section:	
body_regex	<p>The regular expression that the RTSP response body must match.</p> <ul style="list-style-type: none">• Type: String• Required: false

Property	Description
	<ul style="list-style-type: none">Default value: <none>
path	<p>The path to use in the RTSP request (some servers will return 500 Internal Server Error unless this is a valid media file).</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "/"
status_regex	<p>The regular expression that the RTSP response status code must match.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "^([234])[0-9][0-9]\$"
Properties for the "script" section:	
arguments	<p>A table containing arguments and argument values to be passed to the monitor program.</p> <ul style="list-style-type: none">Type: TableRequired: falsePrimary key:<ul style="list-style-type: none">name (String): The name of the argument to be passed to the monitor program. (Required)Sub keys:<ul style="list-style-type: none">value (String): The value of the argument to be passed to the monitor program. (Required)description (String): A description for the argument provided to the program.

Property	Description
program	<p>The program to run. This must be an executable file, either within the monitor scripts directory or specified as an absolute path to some other location on the filesystem.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
Properties for the "sip" section:	
body_regex	<p>The regular expression that the SIP response body must match.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
status_regex	<p>The regular expression that the SIP response status code must match.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: "^234[0-9][0-9]\$"
transport	<p>Which transport protocol the SIP monitor will use to query the server.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "udp"• Permitted values: "tcp": TCP "udp": UDP

Property	Description
Properties for the "tcp" section:	
close_string	<p>An optional string to write to the server before closing the connection.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
max_response_len	<p>The maximum amount of data to read back from a server, use 0 for unlimited. Applies to TCP and HTTP monitors.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "2048"
response_regex	<p>A regular expression to match against the response from the server. Applies to TCP monitors only.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: ".+"
write_string	<p>The string to write down the TCP connection.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
Properties for the "udp" section:	
accept_all	<p>If this monitor uses UDP, should it accept responses from any IP and port?</p> <ul style="list-style-type: none">• Type: Boolean

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: false

Monitor Program

URI Endpoint: /api/tm/8.3/config/active/monitor_scripts

An executable program that can be used to by external program monitors to report the health of backend services.

Property	Description
There are no properties to display for this resource.	

NAT Configuration

URI Endpoint: /api/tm/8.3/config/active/appliance/nat

The NAT configuration file stores rules controlling NAT on an appliance.

Property	Description
many_to_one_all_ports	<p>This is table 'many_to_one_all_ports'</p> <ul style="list-style-type: none">Type: TableRequired: falsePrimary key:<ul style="list-style-type: none">rule_number (String): A unique rule identifier (Required)Sub keys:<ul style="list-style-type: none">pool (String): Pool of a "many to one overload" type NAT rule. (Required)

Property	Description
	<ul style="list-style-type: none"> tip (String): TIP Group of a "many to one overload" type NAT rule. (Required)
many_to_one_port_locked	<p>This is table 'many_to_one_port_locked'</p> <ul style="list-style-type: none"> Type: Table Required: false Primary key: <ul style="list-style-type: none"> rule_number (String): A unique rule identifier (Required) Sub keys: <ul style="list-style-type: none"> pool (String): Pool of a "many to one port locked" type NAT rule. (Required) port (UInt): Port number of a "many to one port locked" type NAT rule. (Required) protocol (Enum(String)): Protocol of a "many to one port locked" type NAT rule. (Required) <p>Permitted values:</p> <p>"icmp": ICMP</p> <p>"sctp": SCTP</p> <p>"tcp": TCP</p> <p>"udp": UDP</p> <p>"udplite": UDPLITE</p> <ul style="list-style-type: none"> tip (String): TIP Group of a "many to one port locked" type NAT rule. one_to_one	<p>This is table 'one_to_one'</p> <ul style="list-style-type: none"> Type: Table

Property	Description
	<ul style="list-style-type: none">• Required: false• Primary key:<ul style="list-style-type: none">• rule_number (String): A unique rule identifier (Required)• Sub keys:<ul style="list-style-type: none">• enable_inbound (Boolean): Enabling the inbound part of a "one to one" type NAT rule. (Required)• ip (String): IP Address of a "one to one" type NAT rule. (Required)• tip (String): TIP group of a "one to one" type NAT rule. (Required)
port_mapping	<p>This is table 'port_mapping'</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• rule_number (String): A unique rule identifier (Required)• Sub keys:<ul style="list-style-type: none">• dport_first (UInt): First port of the dest. port range of a "port mapping" rule. (Required)• dport_last (UInt): Last port of the dest. port range of a "port mapping" rule. (Required)• virtual_server (String): Target Virtual Server of a "port mapping" rule. (Required)

Pool

URI Endpoint: /api/tm/8.3/config/active/pools

The conf/pools directory contains configuration files for backend node pools. The name of a file is the name of the pool it defines. Pools can be configured under the Services > Pools section of the Admin Server UI or by using functions under the Pool section of the SOAP API and CLI.

Property	Description
bandwidth_class	<p>The Bandwidth Management Class this pool uses, if any.</p> <ul style="list-style-type: none">• Type: Reference(config-bandwidth)• Required: false• Default value: <none>
failure_pool	<p>If all of the nodes in this pool have failed, then requests can be diverted to another pool.</p> <ul style="list-style-type: none">• Type: Reference(config-pool)• Required: false• Default value: <none>
max_connection_attempts	<p>The maximum number of nodes to which the traffic manager will attempt to send a request before returning an error to the client. Requests that are non-retryable will be attempted against only one node. Zero signifies no limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
max_idle_connections_pernode	<p>The maximum number of unused HTTP keepalive connections that should be maintained to an individual node. Zero signifies no limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "50"

Property	Description
max_timed_out_connection_attempts	<p>The maximum number of connection attempts the traffic manager will make where the server fails to respond within the time limit defined by the max_reply_time setting. Zero signifies no limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "2"
monitors	<p>The monitors assigned to this pool, used to detect failures in the back end nodes.</p> <ul style="list-style-type: none">• Type: Set(Reference(config-monitor))• Required: false• Default value: <none>
node_close_with_rst	<p>Whether or not connections to the back-end nodes should be closed with a RST packet, rather than a FIN packet. This avoids the TIME_WAIT state, which on rare occasions allows wandering duplicate packets to be safely ignored.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
node_connection_attempts	<p>The number of times the software will attempt to connect to the same back-end node before marking it as failed. This is only used when passive_monitoring is enabled.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "3"
node_delete_behavior	<p>Specify the deletion behavior for nodes in this pool.</p> <ul style="list-style-type: none">• Type: Enum(String)

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: "immediate"Permitted values: "drain": Allow existing connections to the node to finish before deletion. "immediate": All connections to the node are closed immediately.
node_drain_to_delete_timeout	<p>The maximum time that a node will be allowed to remain in a draining state after it has been deleted. A value of 0 means no maximum time.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
nodes_table	<p>A table of all nodes in this pool. A node should be specified as a <ip>:<port> pair, and has a state, weight and priority.</p> <ul style="list-style-type: none">Type: TableRequired: falsePrimary key:<ul style="list-style-type: none">node (String): A node is a combination of an ip address and port (Required)Sub keys:<ul style="list-style-type: none">priority (UInt): The priority of the node, higher values signify higher priority. If a priority is not specified for a node it is assumed to be 1.state (Enum(String)): The state of the pool, which can either be Active, Draining or Disabled

Property	Description
	<p>Permitted values:</p> <p>"active": The node is active.</p> <p>"disabled": The node is disabled.</p> <p>"draining": The node is draining.</p> <ul style="list-style-type: none">weight (Int): Weight for the node. The actual value in isolation does not matter: As long as it is a valid integer 1-100, the per-node weightings are calculated on the relative values between the nodes.source_ip (String): The source address the Traffic Manager uses to connect to this node.
note	<p>A description of the pool.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
passive_monitoring	<p>Whether or not the software should check that 'real' requests (i.e. not those from monitors) to this pool appear to be working. This should normally be enabled, so that when a node is refusing connections, responding too slowly, or sending back invalid data, it can mark that node as failed, and stop sending requests to it. If this is disabled, you should ensure that suitable health monitors are configured to check your servers instead, otherwise failed requests will not be detected and subsequently retried.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
persistence_class	<p>The default Session Persistence class this pool uses, if any.</p> <ul style="list-style-type: none">Type: Reference(config-persistence)

Property	Description
	<ul style="list-style-type: none"> Required: false Default value: <none>
transparent	<p>Whether or not connections to the back-ends appear to originate from the source client IP address.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
Properties for the "auto_scaling" section:	
addnode_delaytime	<p>The time in seconds from the creation of the node which the traffic manager should wait before adding the node to the autoscaled pool. Set this to allow applications on the newly created node time to initialize before being sent traffic.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: <none>
cloud_credentials	<p>The Cloud Credentials object containing authentication credentials to use in cloud API calls.</p> <ul style="list-style-type: none"> Type: Reference(cloud-api) Required: false Default value: <none>
cluster	<p>The ESX host or ESX cluster name to put the new virtual machine instances on.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: <none>

Property	Description
data_center	<p>The name of the logical datacenter on the vCenter server. Virtual machines will be scaled up and down under the datacenter root folder.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
data_store	<p>The name of the datastore to be used by the newly created virtual machine.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
enabled	<p>Are the nodes of this pool subject to autoscaling? If yes, nodes will be automatically added and removed from the pool by the chosen autoscaling mechanism.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
external	<p>Whether or not autoscaling is being handled by an external system. Set this value to Yes if all aspects of autoscaling are handled by an external system, such as RightScale. If set to No, the traffic manager will determine when to scale the pool and will communicate with the cloud provider to create and destroy nodes as necessary.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true

Property	Description
extraargs	<p>Any extra arguments to the autoscaling API. Each argument can be separated by comma. E.g in case of EC2, it can take extra parameters to the Amazon's RunInstance API say DisableApiTermination=false,Placement.Tenancy=default.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
hysteresis	<p>The time period in seconds for which a change condition must persist before the change is actually instigated.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "20"
imageid	<p>The identifier for the image of the instances to create.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
ips_to_use	<p>Which type of IP addresses on the node to use. Choose private IPs if the traffic manager is in the same cloud as the nodes, otherwise choose public IPs.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "publicips"• Permitted values: "private_ips": Private IP addresses "publicips": Public IP addresses

Property	Description
last_node_idle_time	<p>The time in seconds for which the last node in an autoscaled pool must have been idle before it is destroyed. This is only relevant if min_nodes is 0.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "3600"
max_nodes	<p>The maximum number of nodes in this autoscaled pool.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "4"
min_nodes	<p>The minimum number of nodes in this autoscaled pool.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "1"
name	<p>The beginning of the name of nodes in the cloud that are part of this autoscaled pool.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
port	<p>The port number to use for each node in this autoscaled pool.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "80"

Property	Description
refractory	<p>The time period in seconds after the instigation of a re-size during which no further changes will be made to the pool size.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "180"
response_time	<p>The expected response time of the nodes in ms. This time is used as a reference when deciding whether a node's response time is conforming. All responses from all the nodes will be compared to this reference and the percentage of conforming responses is the base for decisions about scaling the pool up or down.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "1000"
scale_down_level	<p>The fraction, in percent, of conforming requests above which the pool size is decreased. If the percentage of conforming requests exceeds this value, the pool is scaled down.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "95"
scale_up_level	<p>The fraction, in percent, of conforming requests below which the pool size is increased. If the percentage of conforming requests drops below this value, the pool is scaled up.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "40"
securitygroupids	List of security group IDs to associate to the new EC2 instance.

Property	Description
	<ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>
size_id	<p>The identifier for the size of the instances to create.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
subnetids	<p>List of subnet IDs where the new EC2-VPC instance(s) will be launched. Instances will be evenly distributed among the subnets. If the list is empty, instances will be launched inside EC2-Classic.</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>
Properties for the "connection" section:	
max_connect_time	<p>How long the pool should wait for a connection to a node to be established before giving up and trying another node.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "4"
max_connections_per_node	<p>The maximum number of concurrent connections allowed to each back-end node in this pool per machine. A value of 0 means unlimited connections.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>

Property	Description
max_queue_size	<p>The maximum number of connections that can be queued due to connections limits. A value of 0 means unlimited queue size.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
max_reply_time	<p>How long the pool should wait for a response from the node before either discarding the request or trying another node (retryable requests only).</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "30"
max_transactions_per_node	<p>The maximum number of concurrent transactions allowed to each back-end node in this pool per machine. A value of 0 means unlimited transactions. Idle connections kept alive for reuse do not count against this limit. A transaction begins by allocating a connection for sending the request, and ends (for the purposes of queuing) after a complete response has been received from the node.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
queue_timeout	<p>The maximum time to keep a connection queued in seconds.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
Properties for the "dns_autoscale" section:	

Property	Description
enabled	<p>When enabled, the Traffic Manager will periodically resolve the hostnames in the "hostnames" list using a DNS query, and use the results to automatically add, remove or update the IP addresses of the nodes in the pool.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
hostnames	<p>A list of hostnames which will be used for DNS-derived autoscaling</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>
port	<p>The port number to use for each node when using DNS-derived autoscaling</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "80"
Properties for the "ftp" section:	
support_rfc_2428	<p>Whether or not the backend IPv4 nodes understand the EPRT and EPSV command from RFC 2428. It is always assumed that IPv6 nodes support these commands.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
Properties for the "http" section:	

Property	Description
keepalive	<p>Whether or not the pool should maintain HTTP keepalive connections to the nodes.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
keepalive_non_idempotent	<p>Whether or not the pool should maintain HTTP keepalive connections to the nodes for non-idempotent requests.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
Properties for the "kerberos_protocol_transition" section:	
principal	<p>The Kerberos principal the traffic manager should use when performing Kerberos Protocol Transition.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
target	<p>The Kerberos principal name of the service this pool targets.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
Properties for the "load_balancing" section:	
algorithm	<p>The load balancing algorithm that this pool uses to distribute load across its nodes.</p> <ul style="list-style-type: none">Type: Enum(String)

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: "round_robin"Permitted values:<ul style="list-style-type: none">"fastest_response_time": The Response Time algorithm monitors the response times for recent requests to each node. It sends each new request to the node that has recently been responding the most quickly."least_connections": This algorithm sends each new request to the node with the fewest currently active connections."perceptive": The Perceptive algorithm uses a combination of response time data and connection counts to predict which node is likely to have the fastest response time for each request."random": This algorithm chooses a random node for each request."round_robin": This algorithm distributes traffic by assigning each request to a new node in turn."weighted_least_connections": This algorithm works in a similar way to the Least Connections algorithm, but assigns more requests to nodes with a greater 'weight'."weighted_round_robin": Weighted Round Robin works in a similar way to Round Robin, but assigns more requests to nodes with a greater 'weight'.
priority_enabled	Enable priority lists.

Property	Description
	<ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
priority_nodes	<p>Minimum number of highest-priority active nodes.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "1"
Properties for the "node" section:	
close_on_death	<p>Close all connections to a node once we detect that it has failed.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
retry_fail_time	<p>The amount of time, in seconds, that a traffic manager will wait before re-trying a node that has been marked as failed by passive monitoring.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "60"
Properties for the "service_discovery" section:	
enabled	<p>Are the nodes of this pool determined by a Service Discovery plugin? If yes, nodes will be automatically added and removed from the pool by the traffic manager.</p> <ul style="list-style-type: none">Type: BooleanRequired: false

Property	Description
	<ul style="list-style-type: none">Default value: false
interval	<p>The minimum time before rerunning the Service Discovery plugin</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
plugin	<p>The plugin script a Service Discovery autoscaled pool should use to retrieve the list of nodes.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
plugin_args	<p>The arguments for the script specified in "service_discovery!plugin", e.g. a common instance tag, or name of a managed group of cloud instances.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
timeout	<p>The maximum time a plugin should be allowed to run before timing out. Set to 0 for no timeout.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
Properties for the "smtp" section:	
send_starttls	<p>If we are encrypting traffic for an SMTP connection, should we upgrade to SSL using STARTTLS.</p> <ul style="list-style-type: none">Type: Boolean

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: true
Properties for the "ssl" section:	
cipher_suites	<p>The SSL/TLS cipher suites to allow for connections to a back-end node. Leaving this empty will make the pool use the globally configured cipher suites, see configuration key ssl!cipher_suites in the Global Settings section of the System tab. See there for how to specify SSL/TLS cipher suites.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
client_auth	<p>Whether or not a suitable certificate and private key from the SSL Client Certificates catalog be used if the back-end server requests client authentication.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
common_name_match	<p>A list of names against which the 'common name' of the certificate is matched; these names are used in addition to the node's hostname or IP address as specified in the config file or added by the autoscaler process.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>

Property	Description
elliptic_curves	<p>The SSL elliptic curve preference list for SSL connections from this pool using TLS version 1.0 or higher. Leaving this empty will make the pool use the globally configured preference list. The named curves P256, P384 and P521 may be configured.</p> <ul style="list-style-type: none">• Type: List(String)• Required: false• Default value: <none>
enable	<p>Whether or not the pool should encrypt data before sending it to a back-end node.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
enhance	<p>SSL protocol enhancements allow your traffic manager to prefix each new SSL connection with information about the client. This enables Pulse Secure Virtual Traffic Manager virtual servers referenced by this pool to discover the original client's IP address. Only enable this if you are using nodes for this pool which are Pulse Secure vTMs, whose virtual servers have the ssl_trust_magic setting enabled.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
middlebox_compatibility	<p>Whether or not TLS 1.3 middlebox compatibility mode as described in RFC 8446 appendix D.4 will be used in connections to pool nodes. Choosing the global setting means the value of configuration key ssl!middlebox_compatibility from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none">• Type: Enum(String)

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: "use_default"• Permitted values:<ul style="list-style-type: none">"disabled": Disable use of middlebox compatibility"enabled": Enable use of middlebox compatibility"use_default": Use the global setting for use of middlebox compatibility
send_close_alerts	<p>Whether or not to send an SSL/TLS "close alert" when initiating a socket disconnection.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
server_name	<p>Whether or not the software should use the TLS 1.0 server_name extension, which may help the back-end node provide the correct certificate. Enabling this setting will force the use of at least TLS 1.0.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
session_cache_enabled	<p>Whether or not the SSL client cache will be used for this pool. Choosing the global setting means the value of the configuration key <code>ssl!client_cache!enabled</code> from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false

Property	Description
	<ul style="list-style-type: none">• Default value: "use_default"• Permitted values:<ul style="list-style-type: none">"disabled": Disable use of the session cache"enabled": Enable use of the session cache"use_default": Use the global setting for use of the session cache
session_tickets_enabled	<p>Whether or not SSL session tickets, including TLS >= 1.3 PSKs, will be used for this pool if the session cache is also enabled. Choosing the global setting means the value of the configuration key ssl!client_cache!tickets_enabled from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "use_default"• Permitted values:<ul style="list-style-type: none">"disabled": Disable use of session tickets"enabled": Enable use of session tickets"use_default": Use the global setting for use of session tickets
signature_algorithms	<p>The SSL signature algorithms preference list for SSL connections from this pool using TLS version 1.2 or higher. Leaving this empty will make the pool use the globally configured preference list, signature_algorithms in the ssl section of the global_settings resource. See there and in the online help for how to specify SSL signature algorithms.</p> <ul style="list-style-type: none">• Type: String• Required: false

Property	Description
	<ul style="list-style-type: none">• Default value: <none>
ssl_fixed_client_certificate	<p>An entry in the SSL client certificates catalog, containing a certificate and private key to be used whenever client authentication is requested. If set, this overrides server request parameters.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
strict_verify	<p>Whether or not strict certificate verification should be performed. This will turn on checks to disallow server certificates that don't match the server name or a name in the ssl_common_name_match list, are self-signed, expired, revoked, or have an unknown CA.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
support_ssl3	<p>Whether or not SSLv3 is enabled for this pool. Choosing the global setting means the value of the configuration key ssl!support_ssl3 from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "use_default"• Permitted values:<ul style="list-style-type: none">"disabled": Disable SSLv3"enabled": Enable SSLv3"use_default": Use the global setting for SSLv3

Property	Description
support_tls1	<p>Whether or not TLSv1.0 is enabled for this pool. Properties for the "tcp" section:	
nagle	<p>Whether or not Nagle's algorithm should be used for TCP connections to the back-end nodes.</p> <ul style="list-style-type: none">Type: BooleanRequired: false

Property	Description
	<ul style="list-style-type: none">• Default value: true
Properties for the "udp" section:	
accept_from	<p>The IP addresses and ports from which responses to UDP requests should be accepted. If set to accept responses from a specific set of IP addresses, you will need to enter a CIDR Mask (such as 10.100.0.0/16).</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "dest_only"• Permitted values:<ul style="list-style-type: none">"all": Any IP address and any port."dest_ip_only": Only the IP address to which the request was sent, but from any port."dest_only": Only the IP address and port to which the request was sent."ip_mask": Only a specific set of IP addresses, but from any port.
accept_from_mask	<p>The CIDR mask that matches IPs we want to receive responses from.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
response_timeout	<p>The maximum length of time that a node is permitted to take after receiving a UDP request packet before sending a reply packet. Zero indicates that there is no maximum, preventing a node that does not send replies from being presumed to have failed.</p> <ul style="list-style-type: none">• Type: UInt

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: <none>

Protection Class

URI Endpoint: /api/tm/8.3/config/active/protection

A protection class specifies the level of protection against network attacks for a virtual server.

Property	Description
debug	<p>Whether or not to output verbose logging.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
enabled	<p>Enable or disable this service protection class.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true
log_time	<p>Log service protection messages at these intervals. If set to 0 no messages will be logged and no alerts will be sent.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "60"
note	<p>A description of the service protection class.</p> <ul style="list-style-type: none">• Type: String• Required: false

Property	Description
	<ul style="list-style-type: none"> Default value: <none>
rule	<p>A TrafficScript rule that will be run on the connection after the service protection criteria have been evaluated. This rule will be executed prior to normal rules configured for the virtual server.</p> <ul style="list-style-type: none"> Type: Reference(config-trafficscript) Required: false Default value: <none>
testing	<p>Place the service protection class into testing mode. (Log when this class would have dropped a connection, but allow all connections through).</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
Properties for the "access_restriction" section:	
allowed	<p>Always allow access to these IP addresses. This overrides the connection limits for these machines, but does not stop other restrictions such as HTTP validity checks.</p> <ul style="list-style-type: none"> Type: Set(String) Required: false Default value: <none>
banned	<p>Disallow access to these IP addresses.</p> <ul style="list-style-type: none"> Type: Set(String) Required: false Default value: <none>
Properties for the "concurrent_connections" section:	

Property	Description
max_10_connections	<p>Additional limit on maximum concurrent connections from the top 10 busiest connecting IP addresses combined. The value should be between 1 and 10 times the max_1_connections limit. (This limit is disabled if per_process_connection_count is No, or max_1_connections is 0, or min_connections is 0.)</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "200"
max_1_connections	<p>Maximum concurrent connections each connecting IP address is allowed. Set to 0 to disable this limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "30"
min_connections	<p>Entry threshold for the max_10_connections limit: the max_10_connections limit is not applied to connecting IP addresses with this many or fewer concurrent connections. Setting to 0 disables both the max_1_connections and max_10_connections limits, if per_process_connection_count is Yes. (If per_process_connection_count is No, this setting is ignored.)</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "4"
per_process_connection_count	<p>Whether concurrent connection counting and limits are per-process. (Each Traffic Manager typically has several processes: one process per available CPU core.) If Yes, a connecting IP address may make that many connections to each process within a Traffic Manager. If No, a connecting IP address may make that many connections to each Traffic Manager as a whole.</p>

Property	Description
	<ul style="list-style-type: none"> Type: Boolean Required: false Default value: true
Properties for the "connection_rate" section:	
max_connection_rate	<p>Maximum number of new connections each connecting IP address is allowed to make in the rate_timer interval. Set to 0 to disable this limit. If applied to an HTTP Virtual Server each request sent on a connection that is kept alive counts as a new connection. The rate limit is per process: each process within a Traffic Manager accepts new connections from the connecting IP address at this rate. (Each Traffic Manager typically has several processes: one process per available CPU core).</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: <none>
rate_timer	<p>How frequently the max_connection_rate is assessed. For example, a value of 1 (second) will impose a limit of max_connection_rate connections per second; a value of 60 will impose a limit of max_connection_rate connections per minute. The valid range is 1-99999 seconds.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "60"
Properties for the "http" section:	
check_rfc2396	<p>Whether or not requests with poorly-formed URLs be should be rejected. This tests URL compliance as defined in RFC2396. Note that enabling this may block some older, non-conforming web browsers.</p>

Property	Description
	<ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
max_body_length	<p>Maximum permitted length of HTTP request body data, set to 0 to disable the limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
max_header_length	<p>Maximum permitted length of a single HTTP request header (key and value), set to 0 to disable the limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
max_request_length	<p>Maximum permitted size of all the HTTP request headers, set to 0 to disable the limit.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>

reject_binary	<p>Whether or not URLs and HTTP request headers that contain binary data (after decoding) should be rejected.</p>

Property	Description
	<ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
send_error_page	<p>This setting tells the traffic manager to send an HTTP error message if a connection fails the service protection tests, instead of just dropping it. Details of which HTTP response will be sent when particular tests fail can be found in the Help section for this page.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true

Pulse Secure Virtual Web Application Firewall

URI Endpoint: /api/tm/8.3/config/active/application_firewall

The conf/zeusafm.conf file contains configuration files for the application firewall. Some keys present in the zeusafm.conf are not documented here. Refer to the Pulse Secure Web Application Firewall documentation for further details. The configuration can be edited under the System > Application Firewall section of the Administration Server or by using functions under the AFM section of the SOAP API and CLI.

Property	Description
There are no properties to display for this resource.	

Rate Shaping Class

URI Endpoint: /api/tm/8.3/config/active/rate

A rate shaping class restricts the number of connections being processed by a virtual server at once.

Property	Description
max_rate_per_minute	Requests that are associated with this rate class will be rate-shaped to this many requests per minute, set to 0 to disable the limit. <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
max_rate_per_second	Although requests will be rate-shaped to the max_rate_per_minute, the traffic manager will also rate limit per-second. This smooths traffic so that a full minute's traffic will not be serviced in the first second of the minute, set this to 0 to disable the per-second limit. <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
note	A description of the rate class. <ul style="list-style-type: none">Type: FreeformStringRequired: falseDefault value: <none>

Rule

URI Endpoint: /api/tm/8.3/config/active/rules

TrafficScript rules allow traffic inspection and modification.

Property	Description
There are no properties to display for this resource.	

SLM Class

URI Endpoint: /api/tm/8.3/config/active/service_level_monitors

Service level monitoring is used to produce alerts when an application's performance is degraded. This is done by monitoring the response time of connections to a virtual server.

Property	Description
note	<p>A description for the SLM class.</p> <ul style="list-style-type: none">• Type: FreeformString• Required: false• Default value: <none>
response_time	<p>Responses that start being sent to the client within this time limit, expressed in milliseconds, are treated as conforming.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "1000"
serious_threshold	<p>When the percentage of conforming responses drops below this level, a serious error level message will be emitted.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
warning_threshold	<p>When the percentage of conforming responses drops below this level, a warning message will be emitted.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "50"

SSL Client Key Pair

URI Endpoint: /api/tm/8.3/config/active/ssl/client_keys

SSL Client Certificates are used when connecting to backend nodes that require client certificate authentication.

Property	Description
note	Notes for this certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
private	Private key for certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
public	Public certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
request	Certificate Signing Request for certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>

SSL Key Pair

URI Endpoint: /api/tm/8.3/config/active/ssl/server_keys

SSL Server Certificates are presented to clients by virtual servers when SSL decryption is enabled.

Property	Description
note	Notes for this certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
private	Private key for certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
public	Public certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>
request	Certificate Signing Request for certificate <ul style="list-style-type: none">Type: FreeformStringRequired: trueDefault value: <none>

SSL Ticket Key

URI Endpoint: /api/tm/8.3/config/active/ssl/ticket_keys

Configuration for SSL ticket encryption keys when managed externally via the ssl/ticket_keys REST API endpoints.

Property	Description
algorithm	<p>The algorithm used to encrypt session tickets. The algorithm determines the length of the key that must be provided.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "aes_256_cbc_hmac_sha256"Permitted values: "aes_256_cbc_hmac_sha256": AES-256 CBC with HMAC-SHA256. Requires a total of 64 bytes of key material.
id	<p>A 16-byte key identifier, with each byte encoded as two hexadecimal digits. Key identifiers are transmitted in plaintext at the beginning of a TLS session ticket, and are used to identify the ticket encryption key that was used to encrypt a ticket. (They correspond to the 'key_name' field in RFC 5077.) They are required to be unique across the set of SSL ticket encryption keys.</p> <ul style="list-style-type: none">Type: StringRequired: trueDefault value: <none>
key	<p>The session ticket encryption key, with each byte encoded as two hexadecimal digits. The required key length is determined by the chosen key algorithm. See the documentation for the 'algorithm' field for more details.</p> <ul style="list-style-type: none">Type: PasswordRequired: trueDefault value: <none>

Property	Description
validity_end	<p>The latest time at which this key may be used to encrypt new session tickets. Given as number of seconds since the epoch (1970-01-01T00:00:00Z).</p> <ul style="list-style-type: none">• Type: UInt• Required: true• Default value: <none>
validity_start	<p>The earliest time at which this key may be used to encrypt new session tickets. Given as number of seconds since the epoch (1970-01-01T00:00:00Z).</p> <ul style="list-style-type: none">• Type: UInt• Required: true• Default value: <none>

SSL Trusted Certificate

URI Endpoint: /api/tm/8.3/config/active/ssl/cas

SSL certificate authority certificates (CAs) and certificate revocation lists (CRLs) can be used when validating server and client certificates.

Property	Description
There are no properties to display for this resource.	

Security Settings

URI Endpoint: /api/tm/8.3/config/active/security

Security settings that restrict remote administration for the cluster. Additional security options can be found in Global Settings.

Property	Description
access	<p>Access to the admin server and REST API is restricted by usernames and passwords. You can further restrict access to just trusted IP addresses, CIDR IP subnets or DNS wildcards. These access restrictions are also used when another traffic manager initially joins the cluster, after joining the cluster these restrictions are no longer used. Care must be taken when changing this setting, as it can cause the administration server to become inaccessible. Access to the admin UI will not be affected until it is restarted.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
Properties for the "ssh_intrusion" section:	
bantime	<p>The amount of time in seconds to ban an offending host for.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "600"
blacklist	<p>The list of hosts to permanently ban, identified by IP address or DNS hostname in a space-separated list.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
enabled	<p>Whether or not the SSH Intrusion Prevention tool is enabled.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: true

Property	Description
findtime	<p>The window of time in seconds the maximum number of connection attempts applies to. More than (maxretry) failed attempts in this time span will trigger a ban.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "600"
maxretry	<p>The number of failed connection attempts a host can make before being banned.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "6"
whitelist	<p>The list of hosts to never ban, identified by IP address, DNS hostname or subnet mask, in a space-separated list.</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>

Service Discovery Plugins

URI Endpoint: /api/tm/8.3/config/active/servicediscovery

The conf/servicediscovery directory contains plugins for use with Service Discovery for pool nodes.

Property	Description
There are no properties to display for this resource.	

Session Persistence Class

URI Endpoint: /api/tm/8.3/config/active/persistence

A session persistence class is used to identify the session a new connection belongs too and deliver it to the same backend node.

Property	Description
cookie	<p>The cookie name to use for tracking session persistence.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
delete	<p>Whether or not the session should be deleted when a session failure occurs. (Note, setting a failure mode of 'choose a new node' implicitly deletes the session.)</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
failure_mode	<p>The action the pool should take if the session data is invalid or it cannot contact the node specified by the session.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "new_node"Permitted values:<ul style="list-style-type: none">"close": Close the connection (using error_file on Virtual Servers > Edit > Protocol Settings)"new_node": Choose a new node to use"url": Redirect the user to a given URL
note	<p>A description of the session persistence class.</p> <ul style="list-style-type: none">Type: FreeformString

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: <none>
subnet_prefix_length_v4	<p>When using IP-based session persistence, ensure all requests from this IPv4 subnet, specified as a prefix length, are sent to the same node. If set to 0, requests from different IPv4 addresses will be load-balanced individually.</p> <ul style="list-style-type: none">• Type: Int• Required: false• Default value: <none>
subnet_prefix_length_v6	<p>When using IP-based session persistence, ensure all requests from this IPv6 subnet, specified as a prefix length, are sent to the same node. transparent_always_set_cookie	<p>Whether or not the cookie should be inserted in every response sent to the client when using transparent session affinity. If set to No then the cookie is inserted only if the corresponding request did not already contain a matching cookie.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
transparent_directives	<p>The cookie directives to include in the cookie sent when using transparent session affinity. If more than one directive is included, the semi-colon separator between them must be included in this string. The semi-colon separator between the cookie value and the first directive should not be included in this string.</p>

Property	Description
	<ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
type	<p>The type of session persistence to use.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "ip"• Permitted values:<ul style="list-style-type: none">"asp": ASP and ASP.NET session persistence"cookie": Monitor application cookies"ip": IP-based persistence"j2ee": J2EE session persistence"named": Named Node session persistence"ssl": SSL Session ID persistence"transparent": Transparent session affinity"universal": Universal session persistence"x_zeus": X-Zeus-Backend cookies
url	<p>The redirect URL to send clients to if the session persistence is configured to redirect users when a node dies.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>

Traffic IP Group

URI Endpoint: /api/tm/8.3/config/active/traffic_ip_groups

Traffic IP groups are sets of IP addresses that are distributed across a cluster for fault tolerance.

Property	Description
enabled	<p>If set to No, the traffic IP group will be disabled and none of the traffic IP addresses will be raised.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
hash_source_port	<p>Whether or not the source port should be taken into account when deciding which traffic manager should handle a request.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
ip_assignment_mode	<p>Configure how traffic IPs are assigned to traffic managers in Single-Hosted mode</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "balanced"Permitted values:<ul style="list-style-type: none">"alphabetic": Alphabetical order of traffic manager hostnames"balanced": Approximately balanced between traffic managers

Property	Description
ip_mapping	<p>A table assigning traffic IP addresses to machines that should host them. Traffic IP addresses not specified in this table will automatically be assigned to a machine.</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• ip (String): A traffic IP address (from the ipaddresses property). (Required)• Sub keys:<ul style="list-style-type: none">• traffic_manager (String): The name of the traffic manager that should host the IP address. (Required)
ipaddresses	<p>The IP addresses that belong to the Traffic IP group.</p> <ul style="list-style-type: none">• Type: Set(String)• Required: false• Default value: <none>
keepttogether	<p>If set to Yes then all the traffic IPs will be raised on a single traffic manager. By default they're distributed across all active traffic managers in the traffic IP group.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
location	<p>The location in which the Traffic IP group is based.</p> <ul style="list-style-type: none">• Type: Int• Required: false• Default value: <none>

Property	Description
machines	<p>The traffic managers that can host the traffic IP group's IP addresses.</p> <ul style="list-style-type: none">• Type: Set(Reference(config-tm))• Required: false• Default value: <none>
mode	<p>The method used to distribute traffic IPs across machines in the cluster. If "multihosted" is used then multicast must be set to an appropriate multicast IP address.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "singlehosted"• Permitted values:<ul style="list-style-type: none">"ec2elastic": Use an EC2-Classic Elastic IP address."ec2vpcelastic": Use an EC2-VPC Elastic IP address."ec2vpcprivate": Use an EC2-VPC Private IP address."gceexternal": Use GCE External IP addresses."multihosted": Raise each address on every machine in the group (Multi-Hosted mode) - IPv4 only"rhi": Use route health injection to route traffic to the active machine - IPv4 only"singlehosted": Raise each address on a single machine (Single-Hosted mode)

Property	Description
multicast	<p>The multicast IP address used to duplicate traffic to all traffic managers in the group.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
note	<p>A note, used to describe this Traffic IP Group</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
rhi_bgp_metric_base	<p>The base BGP routing metric for this Traffic IP group. This is the advertised routing cost for the active traffic manager in the cluster. It can be used to set up inter-cluster failover.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
rhi_bgp_passive_metric_offset	<p>The BGP routing metric offset for this Traffic IP group. This is the difference between the advertised routing cost for the active and passive traffic manager in the cluster.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
rhi_ospfv2_metric_base	<p>The base OSPFv2 routing metric for this Traffic IP group. This is the advertised routing cost for the active traffic manager in the cluster. It can be used to set up inter-cluster failover.</p> <ul style="list-style-type: none">Type: UInt

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: "10"
rhi_ospfv2_passive_metric_offset	<p>The OSPFv2 routing metric offset for this Traffic IP group. This is the difference between the advertised routing cost for the active and passive traffic manager in the cluster.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
rhi_protocols	<p>A list of protocols to be used for RHI. Currently must be 'ospf' or 'bgp' or both. The default, if empty, is 'ospf', which means that it is not possible to specify no protocol.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: "ospf"
slaves	<p>A list of traffic managers that are in 'passive' mode. This means that in a fully working environment, they will not have any traffic IP addresses assigned to them.</p> <ul style="list-style-type: none">Type: Set(Reference(config-tm))Required: falseDefault value: <none>

Traffic Manager

URI Endpoint: /api/tm/8.3/config/active/traffic_managers

The `conf/zxtms` directory contains a configuration file for each traffic manager in your cluster. The name of each file is the hostname of the traffic manager it represents. These files contain host-specific configuration data and on each installation of the software, the `conf/./global.cfg` file is sym-linked to the host's own configuration in the `conf/zxtms` directory. The files may contain a variety of configuration options that are configured in various locations under the System section of the Admin Server UI and the System section of the SOAP API and CLI.

Property	Description
<code>adminMasterXMLIP</code>	<p>The Application Firewall master XML IP.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: "0.0.0.0"

security_level	<p>The security level for SNMPv3 communications.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "noauthnopriv"• Permitted values:<ul style="list-style-type: none">"authnopriv": Authentication only"authpriv": Authentication and Privacy"noauthnopriv": No Authentication, No Privacy
username	<p>The username required for SNMPv3 commands. (If empty, all SNMPv3 commands will be rejected).</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>

TrafficScript Authenticator

URI Endpoint: /api/tm/8.3/config/active/rule_authenticators

TrafficScript authenticators define remote authentication services that can be queried via a TrafficScript rule.

Property	Description
host	<p>The hostname or IP address of the remote authenticator.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
note	<p>A description of the authenticator.</p> <ul style="list-style-type: none">Type: FreeformStringRequired: falseDefault value: <none>
port	<p>The port on which the remote authenticator should be contacted.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "389"
Properties for the "ldap" section:	
attributes	<p>A list of attributes to return from the search. If blank, no attributes will be returned. If set to '*' then all user attributes will be returned.</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>
bind_dn	<p>The distinguished name (DN) of the 'bind' user. The traffic manager will connect to the LDAP server as this user when searching for user records.</p> <ul style="list-style-type: none">Type: StringRequired: false

Property	Description
	<ul style="list-style-type: none">• Default value: <none>
bind_password	<p>The password for the bind user.</p> <ul style="list-style-type: none">• Type: Password• Required: false• Default value: <none>
filter	<p>The filter used to locate the LDAP record for the user being authenticated. Any occurrences of '%u' in the filter will be replaced by the name of the user being authenticated.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
filter_base_dn	<p>The base distinguished name (DN) under which user records are located on the server.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
ssl_cert	<p>The SSL certificate that the traffic manager should use to validate the remote server. If no certificate is specified then no signature validation will be performed.</p> <ul style="list-style-type: none">• Type: Reference(config-ssl-cacrl)• Required: false• Default value: <none>
ssl_enabled	<p>Whether or not to enable SSL encryption to the LDAP server.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false

Property	Description
	<ul style="list-style-type: none">• Default value: false
ssl_type	<p>The type of LDAP SSL encryption to use.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "ldaps"• Permitted values: "ldaps": LDAPS "starttls": Start TLS

Trusted SAML Identity Provider

URI Endpoint: /api/tm/8.3/config/active/saml/trustedidps

Configuration for SAML IDP trust relationships.

Property	Description
add_zlib_header	<p>Whether or not to add the zlib header when compressing the AuthnRequest</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
certificate	<p>The certificate used to verify Assertions signed by the identity provider</p> <ul style="list-style-type: none">• Type: String• Required: true• Default value: <none>

Property	Description
entity_id	<p>The entity id of the IDP</p> <ul style="list-style-type: none">Type: StringRequired: trueDefault value: <none>
strict_verify	<p>Whether or not SAML responses will be verified strictly</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: true
url	<p>The IDP URL to which Authentication Requests should be sent</p> <ul style="list-style-type: none">Type: StringRequired: trueDefault value: <none>

User Authenticator

URI Endpoint: /api/tm/8.3/config/active/user_authenticators

A user authenticator is used to allow access to the UI and REST API by querying a remote authentication service.

Property	Description
description	<p>A description of the authenticator.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>

Property	Description
enabled	<p>Whether or not this authenticator is enabled.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
type	<p>The type and protocol used by this authentication service.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: true• Default value: <none>• Permitted values:<ul style="list-style-type: none">"ldap": LDAP"radius": RADIUS"tacacs_plus": TACACS+
Properties for the "ldap" section:	
base_dn	<p>The base DN (Distinguished Name) under which directory searches will be applied. The entries for your users should all appear under this DN. An example of a typical base DN is: OU=users, DC=mycompany, DC=local</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
bind_dn	<p>Template to construct the bind DN (Distinguished Name) from the username. The string %u will be replaced by the username. Examples: %u@mycompany.local for Active Directory or cn=%u, dc=mycompany, dc=local for both LDAP and Active Directory.</p> <ul style="list-style-type: none">• Type: String

Property	Description
	<ul style="list-style-type: none">Required: falseDefault value: <none>
dn_method	<p>The bind DN (Distinguished Name) for a user can either be searched for in the directory using the base distinguished name and filter values, or it can be constructed from the username.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "none"Permitted values:<ul style="list-style-type: none">"construct": Construct"none": No setting configured"search": Search
fallback_group	<p>If the group attribute is not defined, or returns no results for the user logging in, the group named here will be used. If not specified, users will be denied access to the traffic manager if no groups matching a Permission Group can be found for them in the directory.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
filter	<p>A filter that can be used to extract a unique user record located under the base DN (Distinguished Name). The string %u will be replaced by the username. This filter is used to find a user's bind DN when dn_method is set to "Search", and to extract group information if the group filter is not specified. Examples: sAMAccountName=%u for Active Directory, or uid=%u for some Unix LDAP schemas.</p> <ul style="list-style-type: none">Type: String

Property	Description
	<ul style="list-style-type: none">• Required: false• Default value: <none>
group_attribute	<p>The LDAP attribute that gives a user's group. If there are multiple entries for the attribute all will be extracted and they'll be lexicographically sorted, then the first one to match a Permission Group name will be used.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
group_field	<p>The sub-field of the group attribute that gives a user's group. For example, if group_attribute is memberOf and this retrieves values of the form CN=mygroup, OU=groups, OU=users, DC=mycompany, DC=local you would set group_field to CN. If there are multiple matching fields only the first matching field will be used.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
group_filter	<p>If the user record returned by filter does not contain the required group information you may specify an alternative group search filter here. This will usually be required if you have Unix/POSIX-style user records. If multiple records are returned the list of group names will be extracted from all of them. The string %u will be replaced by the username. Example: (&(memberUid=%u)(objectClass=posixGroup))</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
port	The port to connect to the LDAP server on.

Property	Description
	<ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "389"
search_dn	<p>The bind DN (Distinguished Name) to use when searching the directory for a user's bind DN. You can leave this blank if it is possible to perform the bind DN search using an anonymous bind.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
search_password	<p>If binding to the LDAP server using search_dn requires a password, enter it here.</p> <ul style="list-style-type: none">Type: PasswordRequired: falseDefault value: <none>
server	<p>The IP or hostname of the LDAP server.</p> <ul style="list-style-type: none">Type: StringRequired: falseDefault value: <none>
ssl	<p>The type of TLS encryption, if any, to use. Usually STARTTLS will be used with port 389, and LDAPS with port 636. A Certificate Authority that the LDAP server's certificate chains back to must be present in the "Admin Certificate Authorities and Certificate Revocation Lists Catalog" under "SSL catalogs", otherwise the connection will fail.</p> <ul style="list-style-type: none">Type: Enum(String)Required: false

timeout	<p>Connection timeout in seconds.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "30"

User Group

URI Endpoint: /api/tm/8.3/config/active/user_groups

Permission groups specify permissions for groups of users. These groups can be given read-write or read-only access to different parts of the configuration hierarchy. Each group will contain a table of permissions. Each table entry has a name that corresponds to a part of the configuration hierarchy, and a corresponding access level. The access level may have values of either none, ro (read only, this is the default), or full. Some permissions have sub-permissions, these are denoted by following the parent permission name with a colon (:) followed by the sub-permission name. The built-in admin group has a special permission key of all with the value full, this must not be altered for the admin group but can be used in other group configuration files to change the default permission level for the group.

Property	Description
description	<p>A description for the group.</p> <ul style="list-style-type: none">• Type: String• Required: false• Default value: <none>
password_expire_time	<p>Members of this group must renew their passwords after this number of days. To disable password expiry for the group set this to 0 (zero). Note that this setting applies only to local users.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
permissions	<p>A table defining which level of permission this group has for specific configuration elements.</p> <ul style="list-style-type: none">• Type: Table• Required: false• Primary key:<ul style="list-style-type: none">• name (String): Configuration element to which this group has a level of permission. (Required)• Sub keys:

Property	Description
	<ul style="list-style-type: none"> access_level (String): Permission level for the configuration element (none, ro or full) (Required)
timeout	<p>Inactive UI sessions will timeout after this number of seconds. To disable inactivity timeouts for the group set this to 0 (zero).</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "30"

Virtual Server

URI Endpoint: /api/tm/8.3/config/active/virtual_servers

The conf/vservers directory contains configuration files that define virtual servers. The name of a file is the name of the virtual server it defines. Virtual servers can be configured under the Services > Virtual Servers section of the Admin Server UI or by using functions under the VirtualServer section of the SOAP API and CLI.

Property	Description
bandwidth_class	<p>The bandwidth management class that this server should use, if any.</p> <ul style="list-style-type: none"> Type: Reference(config-bandwidth) Required: false Default value: <none>
completion_rules	<p>Rules that are run at the end of a transaction, in order, comma separated.</p> <ul style="list-style-type: none"> Type: List(String) Required: false Default value: <none>

Property	Description
connect_timeout	<p>The time, in seconds, for which an established connection can remain idle waiting for some initial data to be received from the client. The initial data is defined as a complete set of request headers for HTTP, SIP and RTSP services, or the first byte of data for all other services. A value of 0 will disable the timeout.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "10"
enabled	<p>Whether the virtual server is enabled.</p> <ul style="list-style-type: none">Type: BooleanRequired: falseDefault value: false
glb_services	<p>The associated GLB services for this DNS virtual server.</p> <ul style="list-style-type: none">Type: Set(String)Required: falseDefault value: <none>

Property	Description
	<p>"enabled": Enable Fallback SCSV</p> <p>"use_default": Use the global setting for Fallback SCSV</p>
issued_certs_never_expire	<p>When the virtual server verifies certificates signed by these certificate authorities, it doesn't check the 'not after' date, i.e., they are considered valid even after their expiration date has passed (but not if they have been revoked).</p> <ul style="list-style-type: none"> Type: Set(String) Required: false Default value: <none>
issued_certs_never_expire_depth	<p>This setting gives the number of certificates in a certificate chain beyond those listed as issued_certs_never_expire whose certificate expiry will not be checked. For example "0" will result in the expiry checks being made for certificates issued by issued_certs_never_expire certificates, "1" will result in no expiry checks being performed for the certificates directly issued by issued_certs_never_expire certificates, "2" will avoid checking expiry for certificates issued by certificates issued by the issued_certs_never_expire certificates as well, and so on.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "1"
ocsp_enable	<p>Whether or not the traffic manager should use OCSP to check the revocation status of client certificates.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
ocsp_issuers	<p>A table of certificate issuer specific OCSP settings.</p> <ul style="list-style-type: none"> Type: Table

Property	Description
	<ul style="list-style-type: none"> Required: false Primary key: <ul style="list-style-type: none"> issuer (String): The name of an issuer (or DEFAULT for default OCSP settings). (Required) Sub keys: <ul style="list-style-type: none"> aia (Boolean): Whether the traffic manager should use AIA information contained in a client certificate to determine which OCSP responder to contact. nonce (Enum(String)): How to use the OCSP nonce extension, which protects against OCSP replay attacks. Some OCSP servers do not support nonces. Permitted values: "off": No nonce check "on": Use nonce, server does not have to reply with nonce "strict": Use nonce, server must reply with nonce required (Enum(String)): Whether we should do an OCSP check for this issuer, and whether it is required or optional. Permitted values: "none": None "optional": OCSP check optional "strict": OCSP check required responder_cert (String): The expected responder certificate. signer (String): The certificate with which to sign the request, if any. url (String): Which OCSP responders this virtual server should use to verify client certificates.

Property	Description
ocsp_max_response_age	<p>The number of seconds for which an OCSP response is considered valid if it has not yet exceeded the time specified in the 'nextUpdate' field. If set to 0 (zero) then OCSP responses are considered valid until the time specified in their 'nextUpdate' field.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: <none>
ocsp_stapling	<p>If OCSP URIs are present in certificates used by this virtual server, then enabling this option will allow the traffic manager to provide OCSP responses for these certificates as part of the handshake, if the client sends a TLS status_request extension in the ClientHello.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
ocsp_time_tolerance	<p>The number of seconds outside the permitted range for which the 'thisUpdate' and 'nextUpdate' fields of an OCSP response are still considered valid.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "30"
ocsp_timeout	<p>The number of seconds after which OCSP requests will be timed out.</p> <ul style="list-style-type: none">• Type: UInt• Required: false• Default value: "10"
request_client_cert	<p>Whether or not the virtual server should request an identifying SSL certificate from each client.</p> <ul style="list-style-type: none">• Type: Enum(UInt)

Property	Description
	<ul style="list-style-type: none"> Required: false Default value: "dont_request" Permitted values: <ul style="list-style-type: none"> "dont_request": Do not request a client certificate "request": Request, but do not require a client certificate "require": Require a client certificate
send_close_alerts	<p>Whether or not to send an SSL/TLS "close alert" when the traffic manager is initiating an SSL socket disconnection.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: true
server_certificates	<p>The SSL certificates and corresponding private keys.</p> <ul style="list-style-type: none"> Type: List(String) Required: false Default value: <none>
server_certificate_default	<p>The default SSL certificate to use for this virtual server.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: <none>
server_certificate_host_mapping	<p>Host specific SSL server certificate mappings.</p> <ul style="list-style-type: none"> Type: Table Required: false

Property	Description
	<ul style="list-style-type: none"> Primary key: <ul style="list-style-type: none"> host (String): Host which this entry refers to. (Required) Sub keys: <ul style="list-style-type: none"> certificate (String): The SSL server certificate for a particular destination site IP. (Required) alt_certificates (List(String)): The SSL server certificates for a particular destination site IP.
session_cache_enabled	<p>Whether or not use of the session cache is enabled for this virtual server. Choosing the global setting means the value of configuration key ssl!session_cache_enabled from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none"> Type: Enum(String) Required: false Default value: "use_default" Permitted values: <ul style="list-style-type: none"> "disabled": Disable use of the session cache "enabled": Enable use of the session cache "use_default": Use the global setting for use of the session cache
session_tickets_enabled	<p>Whether or not use of session tickets is enabled for this virtual server. Choosing the global setting means the value of configuration key ssl!tickets!enabled from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none"> Type: Enum(String) Required: false Default value: "use_default" Permitted values:

Property	Description
	<p>"disabled": Disable use of the session tickets</p> <p>"enabled": Enable use of the session tickets</p> <p>"use_default": Use the global setting for use of session tickets</p>
signature_algorithms	<p>The SSL signature algorithms preference list for SSL connections to this virtual server using TLS version 1.2 or higher. Leaving this empty will make the virtual server use the globally configured preference list, signature_algorithms in the ssl section of the global_settings resource. See there and in the online help for how to specify SSL signature algorithms.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: <none>
support_ssl3	<p>Whether or not SSLv3 is enabled for this virtual server. Choosing the global setting means the value of configuration key ssl!support_ssl3 from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none"> Type: Enum(String) Required: false Default value: "use_default" Permitted values: <ul style="list-style-type: none"> "disabled": Disable SSLv3 "enabled": Enable SSLv3 "use_default": Use the global setting for SSLv3
support_tls1	<p>Whether or not TLSv1.0 is enabled for this virtual server. Choosing the global setting means the value of configuration key ssl!support_tls1 from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none"> Type: Enum(String) Required: false

Property	Description
	<ul style="list-style-type: none"> Default value: "use_default" Permitted values: <ul style="list-style-type: none"> "disabled": Disable TLSv1.0 "enabled": Enable TLSv1.0 "use_default": Use the global setting for TLSv1.0
support_tls1_1	<p>Whether or not TLSv1.1 is enabled for this virtual server. Property	Description
	<p>"enabled": Enable TLSv1.2</p> <p>"use_default": Use the global setting for TLSv1.2</p>
support_tls1_3	<p>Whether or not TLSv1.3 is enabled for this virtual server. Choosing the global setting means the value of configuration key ssl!support_tls1_3 from the Global Settings section of the System tab will be enforced.</p> <ul style="list-style-type: none"> Type: Enum(String) Required: false Default value: "use_default" Permitted values: <ul style="list-style-type: none"> "disabled": Disable TLSv1.3 "enabled": Enable TLSv1.3 "use_default": Use the global setting for TLSv1.3
trust_magic	<p>If the traffic manager is receiving traffic sent from another traffic manager, then enabling this option will allow it to decode extra information on the true origin of the SSL connection. This information is supplied by the first traffic manager.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
Properties for the "syslog" section:	
enabled	<p>Whether or not to log connections to the virtual server to a remote syslog host.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false

Property	Description
format	<p>The log format for the remote syslog. This specifies the line of text that will be sent to the remote syslog when a connection to the traffic manager is completed. Many parameters from the connection can be recorded using macros.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: "%h %l %u %t \"%r\" %s %b \"%{Referer}i\" \"%{User-agent}i\""
ip_end_point	<p>The remote host and port (default is 514) to send request log lines to.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: <none>
msg_len_limit	<p>Maximum length in bytes of a message sent to the remote syslog. Messages longer than this will be truncated before they are sent.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "2048"
Properties for the "tcp" section:	
close_with_rst	<p>Whether or not connections from clients should be closed with a RST packet, rather than a FIN packet. This avoids the TIME_WAIT state, which on rare occasions allows wandering duplicate packets to be safely ignored.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
nagle	<p>Whether or not Nagle's algorithm should be used for TCP connections.</p> <ul style="list-style-type: none"> Type: Boolean

Property	Description
	<ul style="list-style-type: none"> Required: false Default value: false
proxy_close	<p>If set to Yes the traffic manager will send the client FIN to the back-end server and wait for a server response instead of closing the connection immediately. This is only necessary for protocols that require half-close support to function correctly, such as "rsh". If the traffic manager is responding to the request itself, setting this key to Yes will cause the traffic manager to continue writing the response even after it has received a FIN from the client.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
Properties for the "transaction_export" section:	
brief	<p>Whether to export a restricted set of metadata about transactions processed by this virtual server. If enabled, more verbose information such as client and server headers and request tracing events will be omitted from the exported data.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
enabled	<p>Export metadata about transactions handled by this service to the globally configured endpoint. Data will be exported only if the global transaction_export!enabled setting is enabled.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: true
hi_res	<p>Whether the transaction processing timeline included in the metadata export is recorded with a high, microsecond, resolution. If set to No, timestamps will be recorded with a resolution of milliseconds.</p>

Property	Description
	<ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
http_header_blacklist	<p>The set of HTTP header names for which corresponding values should be redacted from the metadata exported by this virtual server.</p> <ul style="list-style-type: none"> Type: Set(String) Required: false Default value: "Authorization"
Properties for the "udp" section:	
end_point_persistence	<p>Whether UDP datagrams received from the same IP address and port are sent to the same pool node if they match an existing UDP session. Sessions are defined by the protocol being handled, for example SIP datagrams are grouped based on the value of the Call-ID header.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: true
port_smp	<p>Whether or not UDP datagrams should be distributed across all traffic manager processes, if this behaviour is not normally selected automatically due to other settings.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
rbuf_size	<p>If this setting is non-zero, the virtual server will set the socket receive buffer size to this number of bytes. If set, this will override the so_rbuf_size setting. An OS-specified limit on socket buffer sizes such as given by sysctl net.core.rmem_max can be exceeded using this setting.</p>

Property	Description
	<ul style="list-style-type: none">Type: UIntRequired: falseDefault value: <none>
response_datagrams_expected	<p>The virtual server should discard any UDP connection and reclaim resources when the node has responded with this number of datagrams. For simple request/response protocols this can be often set to 1. If set to -1, the connection will not be discarded until the timeout is reached.</p> <ul style="list-style-type: none">Type: IntRequired: falseDefault value: "1"
smp_mode	<p>Whether the traffic manager should try to use SO_REUSEPORT for distributing incoming UDP datagrams across multiple processes (if kernel support is detected) or whether the legacy (pre-20.2) multi-processing mode should be used.</p> <ul style="list-style-type: none">Type: Enum(String)Required: falseDefault value: "auto"Permitted values:<ul style="list-style-type: none">"auto": auto"legacy": legacy
timeout	<p>The virtual server should discard any UDP connection and reclaim resources when no further UDP traffic has been seen within this time.</p> <ul style="list-style-type: none">Type: UIntRequired: falseDefault value: "7"

Property	Description
wbuff_size	<p>If this setting is non-zero, the virtual server will set the socket send buffer size to this number of bytes. If set, this will override the so_wbuff_size setting. An OS-specified limit on socket buffer sizes such as given by sysctl net.core.wmem_max can be exceeded using this setting.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: <none>
Properties for the "web_cache" section:	
control_out	<p>The "Cache-Control" header to add to every cached HTTP response, no-cache or max-age=600 for example.</p> <ul style="list-style-type: none"> Type: String Required: false Default value: <none>
enabled	<p>If set to Yes the traffic manager will attempt to cache web server responses.</p> <ul style="list-style-type: none"> Type: Boolean Required: false Default value: false
error_page_time	<p>Time period to cache error pages for.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "30"
max_time	<p>Maximum time period to cache web pages for.</p> <ul style="list-style-type: none"> Type: UInt Required: false

Property	Description
	<ul style="list-style-type: none"> Default value: "600"
refresh_time	<p>If a cached page is about to expire within this time, the traffic manager will start to forward some new requests on to the web servers. A maximum of one request per second will be forwarded; the remainder will continue to be served from the cache. This prevents "bursts" of traffic to your web servers when an item expires from the cache. Setting this value to 0 will stop the traffic manager updating the cache before it expires.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: "2"

Web Accelerator Profile

URI Endpoint: /api/tm/8.3/config/active/optimizer/profiles

A Web Accelerator profile can be applied to an HTTP virtual server to enable automatic web content optimization.

Property	Description
background_after	<p>If Web Accelerator can finish optimizing the resource within this time limit then serve the optimized content to the client, otherwise complete the optimization in the background and return the original content to the client. If set to 0, Web Accelerator will always wait for the optimization to complete before sending a response to the client.</p> <ul style="list-style-type: none"> Type: UInt Required: false Default value: <none>

Property	Description
background_on_additional_resources	<p>If a web page contains resources that have not yet been optimized, fetch and optimize those resources in the background and send a partially optimized web page to clients until all resources on that page are ready.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false
mode	<p>Set the Web Accelerator mode to turn acceleration on or off.</p> <ul style="list-style-type: none">• Type: Enum(String)• Required: false• Default value: "active"• Permitted values:<ul style="list-style-type: none">"active": On - Web Accelerator acceleration is enabled"idle": Off - Acceleration is disabled, but requests for Web Accelerator resources are served"stealth": Stealth - Acceleration is controlled by a cookie
show_info_bar	<p>Show the Web Accelerator information bar on optimized web pages. This requires HTML optimization to be enabled in the acceleration settings.</p> <ul style="list-style-type: none">• Type: Boolean• Required: false• Default value: false

SNMP Counter Values

Actions

URI Endpoint: /api/tm/8.3/status/local_tm/statistics/actions/*

	<ul style="list-style-type: none">Primary key:<ul style="list-style-type: none">name (String): Name of the pool (Required)Sub keys:<ul style="list-style-type: none">failure_pool (String): Failure pool associated with this pool.active_nodes (Set(String)): List of nodes which are in the active state.draining_nodes (Set(String)): List of nodes which are in the draining state.disabled_nodes (Set(String)): List of nodes which are in the disabled state.
tip_errors	List of traffic IP errors for the traffic manager <ul style="list-style-type: none">Type: Set(String)
virtual_servers	A table of virtual server status <ul style="list-style-type: none">Type: TableRequired: falsePrimary key:<ul style="list-style-type: none">name (String): Name of the virtual server (Required)Sub keys:<ul style="list-style-type: none">pool (String): Pool associated with this virtual server.port (UInt): Port the virtual server listens on.throughput (UInt64): Through put for the virtual server.ts_redirect_pools (Set(String)): List of pools which may be selected by Traffic Script Request Rules.

Handling Updates to the REST API

REST API Support in the Traffic Manager

The Traffic Manager typically supports several major versions of its REST API in any one release, and can additionally support several minor versions of each major version. The Traffic Manager employs this system to facilitate upgrading from an older supported version to a newer version with the least possible constraints on development time. Ivanti operates a policy of always warning about the impending removal of an API version in the release notes of the preceding Traffic Manager release.

The REST API version number is split into a major and minor component, and is two sets of digits separated by a dot. Using BNF notation, the follows rules apply:

```
<REST API version> ::= <major> "." <minor>
<major> ::= <non-negative integer>
<minor> ::= <non-negative integer>
```

Ivanti typically increments the version number in each release of the Traffic Manager, with the extent of the increment dependent on the changes introduced to the API since the preceding release. A significant API update necessitates incrementing the major component of the version number (with the minor version reset to 0). For example, from 3.4 to 4.0. A smaller API change increments only the minor component by 1, for example, from 3.4 to 3.5.

Major changes typically occur in the following situations:

- Removing or renaming a resource.
- Removing or renaming a property within a resource.
- Adding a property without a default to an existing resource.

Minor changes typically occur in the following situations:

- Adding a new resource to the API.
- Adding a new property with a default value to an existing JSON resource.

For more information, contact Pulse Secure Technical Support.

Updating Your Applications to Use a New Version of the API

If you are considering adopting a new version of the Traffic Manager REST API for your existing scripts and applications, Ivanti strongly recommends you take the following steps in order to minimize the impact of the update:

- Avoid hard-coding the API version number in multiple places in a script or application.
- Avoid mixing requests to different major API versions across a single Traffic Manager cluster. For example, it is unsafe to access a resource at a 3.x API version in one script and a 4.x API version in another.

Changes Involving a Minor API Update

For upgrades involving a minor increment to a currently used major version, for example 3.4 to 3.5, PUTs and GETs made to the previous API version are expected to operate as intended with the newer API version. Ivanti recommends you verify that the client behaves as expected when any new keys or resources are returned.

Changes Involving a Major API Update

For upgrades involving a new major API version, for example 3.11 to 4.0, first audit your scripts and applications to determine the list of resources and properties you are accessing. Next, refer to [REST API Change History](#) for the change history since your current version up to and including the desired new version. Compare your set of accessed resources and properties to the changes listed and note where a resource or properties has been affected, with specific reference to any renames or deletes. Finally, modify your scripts and applications accordingly.

REST API Change History

Pulse Secure Virtual Traffic Manager release 21.4 includes version 8.3 of the REST API.

This appendix lists the changes introduced in each supported API version. Applications that were developed against older versions of the Traffic Manager REST API might be affected by the updates listed here. Use the information contained in this appendix to identify the necessary updates.

Changes in Version 8.3

The following properties in 'Virtual Server' (/api/tm/8.3/config/active/virtual_servers) have been added:

- Property 'ssl/ca_sites' was added.

Changes in Version 8.2

The following properties in 'Global Settings' (/api/tm/8.2/config/active/global_settings) have been added:

- Property 'basic/max_tcp_buff_mem' was added.

The following properties in 'Virtual Server' (/api/tm/8.2/config/active/virtual_servers) have been added:

- Property 'http2/http_client_buffer_multiplier' was added.
- Property 'http2/http_server_buffer_multiplier' was added.

The following properties in 'Traffic Manager' (/api/tm/8.2/config/active/traffic_managers) have been added:

- Property 'admin/hsts_enable' was added.
- Property 'admin/hsts_max_age' was added.

Changes in Version 8.1

The following properties in 'Virtual Server' (/api/tm/8.1/config/active/virtual_servers) have been added:

- Property 'udp/rbuff_size' was added.
- Property 'udp/smp_mode' was added.
- Property 'udp/wbuff_size' was added.

The following properties in 'Globals' (/api/tm/8.1/status/local_tm/statistics/globals) have been added:

- Property 'statistics/total_udp_bytes_in_dropped' was added.
- Property 'statistics/total_udp_bytes_out_dropped' was added.

The following properties in 'Global Settings' (/api/tm/8.1/config/active/global_settings) have been added:

- Property 'connection/udp_read_multiple' was added.
- Property 'zoneinfo/directory' was added.

The following properties in 'Virtual servers' (/api/tm/8.1/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/udp_bytes_in_dropped' was added.
- Property 'statistics/udp_bytes_out_dropped' was added.

Changes in Version 8.0

The following resources were added:

- Resource 'Admin SSL Trusted Certificate' (/api/tm/8.0/config/active/ssl/admin_cas)

The following properties in 'User Authenticator' (/api/tm/8.0/config/active/user_authenticators) have been added:

- Property 'ldap/ssl' was added.

Changes in Version 7.1

The following properties in 'Global Settings' (/api/tm/7.1/config/active/global_settings) have been added:

- Property 'basic/http2_conn_frame_queue_limit' was added.

Changes in Version 7.0

The following properties in 'Ip session cache' (/api/tm/7.0/status/local_tm/statistics/cache/ip_session_cache) have been added:

- Property 'statistics/expiries' was added.

The following properties in 'J2ee session cache' (/api/tm/7.0/status/local_tm/statistics/cache/j2ee_session_cache) have been added:

- Property 'statistics/expiries' was added.

The following properties in 'Virtual Server' (/api/tm/7.0/config/active/virtual_servers) have been added:

- Property 'sip/udp_associate_by_source' was added.

The following properties in 'Uni session cache' (/api/tm/7.0/status/local_tm/statistics/cache/uni_session_cache) have been added:

- Property 'statistics/expiries' was added.

The following properties in 'Global Settings' (/api/tm/7.0/config/active/global_settings) have been added:

- Property 'session/ip_cache_expiry' was added.
- Property 'session/j2ee_cache_expiry' was added.
- Property 'session/universal_cache_expiry' was added.

The following properties in 'Global Settings' (/api/tm/7.0/config/active/global_settings) have been removed:

- Property 'admin/ssl_prevent_timing_side_channels' was removed.
- Property 'ssl/prevent_timing_side_channels' was removed.

Changes in Version 6.2

The following properties in 'Traffic Manager' (/api/tm/6.2/config/active/traffic_managers) have been added:

- Property 'appliance/managegceroutes' was added.
- Property 'appliance/manageresolved' was added.
- Property 'remote_licensing/is_template' was added.
- Property 'remote_licensing/registration_identifier' was added.
- Property 'soap/max_requests' was added.

The following properties in 'Global Settings' (/api/tm/6.2/config/active/global_settings) have been added:

- Property 'gce/action_timeout' was added.
- Property 'remote_licensing/comm_channel_enabled' was added.
- Property 'remote_licensing/comm_channel_port' was added.
- Property 'remote_licensing/server_certificate_secondary' was added.
- Property 'rest_api/maxfds' was added.
- Property 'ssl/middlebox_compatibility' was added.
- Property 'watchdog/timeout' was added.

The following properties in 'Information' (/api/tm/6.2/status/local_tm/information) have been added:

- Property 'information/platform' was added.

The following properties in 'Pool' (/api/tm/6.2/config/active/pools) have been added:

- Property 'connection/max_transactions_per_node' was added.
- Property 'ssl/middlebox_compatibility' was added.
- Property 'ssl/ssl_fixed_client_certificate' was added.
- Property 'ssl/support_tls1_3' was added.

Changes in Version 6.1

The following properties in 'Session Persistence Class' (/api/tm/6.1/config/active/persistence) have been added:

- Property 'basic/transparent_always_set_cookie' was added.
- Property 'basic/transparent_directives' was added.

The following properties in 'Virtual Server' (/api/tm/6.1/config/active/virtual_servers) have been added:

- Property 'ssl/support_tls1_3' was added.

The following properties in 'Globals' (/api/tm/6.1/status/local_tm/statistics/globals) have been added:

- Property 'statistics/ssl_handshake_tlsv13' was added.

The following properties in 'Virtual servers' (/api/tm/6.1/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/ssl_hello_retry_requested' was added.

The following properties in 'Global Settings' (/api/tm/6.1/config/active/global_settings) have been added:

- Property 'admin/support_tls1_3' was added.
- Property 'fault_tolerance/multicast_version' was added.
- Property 'ssl/log_keys' was added.
- Property 'ssl/support_tls1_3' was added.
- Property 'telemetry/autotest_schedule' was added.

The following properties in 'Traffic Manager' (/api/tm/6.1/config/active/traffic_managers) have been renamed:

- Property 'basic/developer_mode_accepted' was renamed to 'basic/community_edition_accepted'.

Changes in Version 6.0

The following properties in 'Virtual Server' (/api/tm/6.0/config/active/virtual_servers) have been added:

- Property 'basic/proxy_protocol_optional' was added.

The following properties in 'Pools' (/api/tm/6.0/status/local_tm/statistics/pools/*) have been added:

- Property 'statistics/http1xx_responses' was added.
- Property 'statistics/http2xx_responses' was added.
- Property 'statistics/http3xx_responses' was added.
- Property 'statistics/http4xx_responses' was added.
- Property 'statistics/http503_retries' was added.
- Property 'statistics/http5xx_responses' was added.

The following properties in 'GLB Service' (/api/tm/6.0/config/active/glb_services) have been added:

- Property 'basic/optimistic_location_health' was added.

The following properties in 'Virtual servers' (/api/tm/6.0/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/http1xx_responses' was added.
- Property 'statistics/http2xx_responses' was added.
- Property 'statistics/http3xx_responses' was added.
- Property 'statistics/http4xx_responses' was added.
- Property 'statistics/http5xx_responses' was added.
- Property 'statistics/http_cache2xx_responses' was added.
- Property 'statistics/http_cache3xx_responses' was added.
- Property 'statistics/http_cache4xx_responses' was added.
- Property 'statistics/http_cache5xx_responses' was added.
- Property 'statistics/http_generated2xx_responses' was added.
- Property 'statistics/http_generated3xx_responses' was added.
- Property 'statistics/http_generated4xx_responses' was added.
- Property 'statistics/http_generated5xx_responses' was added.
- Property 'statistics/http_server1xx_responses' was added.
- Property 'statistics/http_server2xx_responses' was added.
- Property 'statistics/http_server3xx_responses' was added.
- Property 'statistics/http_server4xx_responses' was added.
- Property 'statistics/http_server5xx_responses' was added.

The following properties in 'Traffic Manager' (/api/tm/6.0/config/active/traffic_managers) have been added:

- Property 'appliance/dnscache' was added.
- Property 'appliance/dnssec' was added.

The following properties in 'Web cache' (/api/tm/6.0/status/local_tm/statistics/cache/web_cache) have been removed:

- Property 'statistics/hits_hi' was removed.
- Property 'statistics/hits_lo' was removed.
- Property 'statistics/lookups_hi' was removed.
- Property 'statistics/lookups_lo' was removed.
- Property 'statistics/misses_hi' was removed.
- Property 'statistics/misses_lo' was removed.

The following properties in 'Pools' (/api/tm/6.0/status/local_tm/statistics/pools/*) have been removed:

- Property 'statistics/bw_limit_bytes_drop' was removed.
- Property 'statistics/bw_limit_bytes_drop_hi' was removed.
- Property 'statistics/bw_limit_bytes_drop_lo' was removed.
- Property 'statistics/bw_limit_pkts_drop' was removed.
- Property 'statistics/bw_limit_pkts_drop_hi' was removed.
- Property 'statistics/bw_limit_pkts_drop_lo' was removed.
- Property 'statistics/bytes_in_hi' was removed.
- Property 'statistics/bytes_in_lo' was removed.
- Property 'statistics/bytes_out_hi' was removed.
- Property 'statistics/bytes_out_lo' was removed.

The following properties in 'Globals' (/api/tm/6.0/status/local_tm/statistics/globals) have been removed:

- Property 'statistics/ssl_handshake_sslv2' was removed.
- Property 'statistics/ssl_session_id_disk_cache_hit' was removed.
- Property 'statistics/ssl_session_id_disk_cache_miss' was removed.
- Property 'statistics/total_bytes_in_hi' was removed.

- Property 'statistics/total_bytes_in_lo' was removed.
- Property 'statistics/total_bytes_out_hi' was removed.
- Property 'statistics/total_bytes_out_lo' was removed.

The following properties in 'State' (/api/tm/6.0/status/local_tm/state) have been removed:

- Property 'data_plane_acceleration/capable' was removed.
- Property 'data_plane_acceleration/configured' was removed.
- Property 'data_plane_acceleration/failed_to_start' was removed.
- Property 'data_plane_acceleration/running' was removed.

The following properties in 'Bandwidth' (/api/tm/6.0/status/local_tm/statistics/bandwidth/*) have been removed:

- Property 'statistics/bytes_drop' was removed.
- Property 'statistics/bytes_drop_hi' was removed.
- Property 'statistics/bytes_drop_lo' was removed.
- Property 'statistics/bytes_out_hi' was removed.
- Property 'statistics/bytes_out_lo' was removed.
- Property 'statistics/pkts_drop' was removed.
- Property 'statistics/pkts_drop_hi' was removed.
- Property 'statistics/pkts_drop_lo' was removed.

The following properties in 'Node inet46' (/api/tm/6.0/status/local_tm/statistics/nodes/node_inet46/*) have been removed:

- Property 'statistics/bytes_from_node_hi' was removed.
- Property 'statistics/bytes_from_node_lo' was removed.
- Property 'statistics/bytes_to_node_hi' was removed.
- Property 'statistics/bytes_to_node_lo' was removed.

The following properties in 'Virtual Server' (/api/tm/6.0/config/active/virtual_servers) have been removed:

- Property 'basic/bypass_data_plane_acceleration' was removed.
- Property 'l4accel/rst_on_service_failure' was removed.
- Property 'l4accel/service_ip_snat' was removed.
- Property 'l4accel/state_sync' was removed.
- Property 'l4accel/tcp_msl' was removed.
- Property 'l4accel/timeout' was removed.
- Property 'l4accel/udp_count_requests' was removed.
- Property 'l4stateless/initial_ring_size' was removed.
- Property 'l4stateless/num_replicas' was removed.
- Property 'udp/udp_end_transaction' was removed.

The following properties in 'Per pool node' (/api/tm/6.0/status/local_tm/statistics/nodes/per_pool_node/*) have been removed:

- Property 'statistics/bytes_from_node_hi' was removed.
- Property 'statistics/bytes_from_node_lo' was removed.
- Property 'statistics/bytes_to_node_hi' was removed.
- Property 'statistics/bytes_to_node_lo' was removed.
- Property 'statistics/l4_stateless_buckets' was removed.
- Property 'statistics/pkts_from_node' was removed.
- Property 'statistics/pkts_from_node_hi' was removed.
- Property 'statistics/pkts_from_node_lo' was removed.
- Property 'statistics/pkts_to_node' was removed.
- Property 'statistics/pkts_to_node_hi' was removed.
- Property 'statistics/pkts_to_node_lo' was removed.

The following properties in 'Virtual servers' (/api/tm/6.0/status/local_tm/statistics/virtual_servers/*) have been removed:

- Property 'statistics/auth_saml_redirects_hi' was removed.
- Property 'statistics/auth_saml_redirects_lo' was removed.
- Property 'statistics/auth_saml_responses_accepted_hi' was removed.
- Property 'statistics/auth_saml_responses_accepted_lo' was removed.
- Property 'statistics/auth_saml_responses_hi' was removed.
- Property 'statistics/auth_saml_responses_lo' was removed.
- Property 'statistics/auth_saml_responses_rejected_hi' was removed.
- Property 'statistics/auth_saml_responses_rejected_lo' was removed.
- Property 'statistics/auth_sessions_created_hi' was removed.
- Property 'statistics/auth_sessions_created_lo' was removed.
- Property 'statistics/auth_sessions_rejected_hi' was removed.
- Property 'statistics/auth_sessions_rejected_lo' was removed.
- Property 'statistics/auth_sessions_used_hi' was removed.
- Property 'statistics/auth_sessions_used_lo' was removed.
- Property 'statistics/bw_limit_bytes_drop' was removed.
- Property 'statistics/bw_limit_bytes_drop_hi' was removed.
- Property 'statistics/bw_limit_bytes_drop_lo' was removed.
- Property 'statistics/bw_limit_pkts_drop' was removed.
- Property 'statistics/bw_limit_pkts_drop_hi' was removed.
- Property 'statistics/bw_limit_pkts_drop_lo' was removed.
- Property 'statistics/bytes_in_hi' was removed.
- Property 'statistics/bytes_in_lo' was removed.
- Property 'statistics/bytes_out_hi' was removed.

- Property 'statistics/bytes_out_lo' was removed.
- Property 'statistics/gzip_bytes_saved_hi' was removed.
- Property 'statistics/gzip_bytes_saved_lo' was removed.

The following properties in 'Global Settings' (/api/tm/6.0/config/active/global_settings) have been removed:

- Property 'basic/data_plane_acceleration_cores' was removed.
- Property 'basic/data_plane_acceleration_mode' was removed.
- Property 'data_plane_acceleration/tcp_delay_ack' was removed.

- Property 'data_plane_acceleration/tcp_win_scale' was removed.
- Property 'fault_tolerance/l4accel_child_timeout' was removed.
- Property 'fault_tolerance/l4accel_sync_port' was removed.
- Property 'l4accel/max_concurrent_connections' was removed.
- Property 'source_nat/clist_locks' was removed.
- Property 'source_nat/ip_limit' was removed.
- Property 'source_nat/ip_local_port_range_high' was removed.
- Property 'source_nat/portmaphashtable_locks' was removed.
- Property 'source_nat/shared_pool_size' was removed.

The following properties in 'Listen ips' (/api/tm/6.0/status/local_tm/statistics/listen_ips/*) have been removed:

- Property 'statistics/bytes_in_hi' was removed.
- Property 'statistics/bytes_in_lo' was removed.
- Property 'statistics/bytes_out_hi' was removed.
- Property 'statistics/bytes_out_lo' was removed.
- Property 'statistics/total_conn' was removed.
- Property 'statistics/total_requests_hi' was removed.
- Property 'statistics/total_requests_lo' was removed.

The following properties in 'Ip gateway' (/api/tm/6.0/status/local_tm/statistics/traffic_ips/ip_gateway) have been removed:

- Property 'statistics/number' was removed.
- Property 'statistics/number_raised' was removed.

The following properties in 'Pool' (/api/tm/6.0/config/active/pools) have been removed:

- Property 'l4accel/snat' was removed.

The following properties in 'Traffic IP Group' (/api/tm/6.0/config/active/traffic_ip_groups) have been removed:

- Property 'basic/backend_traffic_ips' was removed.

The following properties in 'Traffic Manager' (/api/tm/6.0/config/active/traffic_managers) have been removed:

- Property 'appliance/managedpa' was removed.
- Property 'basic/num_l4_children' was removed.
- Property 'basic/num_l7_children' was removed.
- Property 'fault_tolerance/lss_dedicated_ips' was removed.
- Property 'iop/enable_lb' was removed.
- Property 'iop/is_standalone' was removed.
- Property 'iop/l4_event_driven_mode' was removed.
- Property 'iop/l7_event_driven_mode' was removed.
- Property 'iop/linux_interface' was removed.
- Property 'iop/num_hugepages' was removed.
- Property 'iop/num_mbufs_per_mpool' was removed.
- Property 'iop/send_to_linux' was removed.
- Property 'iop/size_hugepage' was removed.

The following properties in 'Network interface' (/api/tm/6.0/status/local_tm/statistics/network_interface/*) have been removed:

- Property 'statistics/rx_bytes_hi' was removed.
- Property 'statistics/rx_bytes_lo' was removed.
- Property 'statistics/tx_bytes_hi' was removed.
- Property 'statistics/tx_bytes_lo' was removed.

The following properties for 'Monitor' (/api/tm/6.0/config/active/monitors) have had flags change:

- Property 'basic/machine' has had the following flags added: [HTML]

The following properties for 'User Group' (/api/tm/6.0/config/active/user_groups) have had flags change:

- Property 'basic/password_expire_time' has had the following flags added: [HTML]
- Property 'basic/timeout' has had the following flags added: [HTML]

Changes in Version 5.2

The following resources were added:

- Resource 'Service Discovery Plugins' (/api/tm/5.2/config/active/servicediscovery)

The following properties in 'Global Settings' (/api/tm/5.2/config/active/global_settings) have been added:

- Property 'ssl/validate_server_certificates_catalog' was added.
- Property 'telemetry/enabled' was added.
- Property 'telemetry/internal_use' was added.
- Property 'telemetry/test_schedule' was added.
- Property 'telemetry/url' was added.

The following properties in 'Traffic Manager' (/api/tm/5.2/config/active/traffic_managers) have been added:

- Property 'appliance/disable_kpti' was added.

The following properties in 'Pool' (/api/tm/5.2/config/active/pools) have been added:

- Property 'service_discovery/enabled' was added.
- Property 'service_discovery/interval' was added.
- Property 'service_discovery/plugin' was added.
- Property 'service_discovery/plugin_args' was added.
- Property 'service_discovery/timeout' was added.

- Property 'ssl/session_tickets_enabled' was added.

The following properties for 'Global Settings' (/api/tm/5.2/config/active/global_settings) have had flags change:

- Property 'remote_licensing/owner_secret' has had the following flags added: [TSR_IGNORE]

Changes in Version 5.1

The following resources were added:

- Resource 'Trusted SAML Identity Provider' (/api/tm/5.1/config/active/saml/trustedidps)

The following properties in 'Virtual Server' (/api/tm/5.1/config/active/virtual_servers) have been added:

- Property 'auth/saml_idp' was added.
- Property 'auth/saml_nameid_format' was added.
- Property 'auth/saml_sp_acs_url' was added.
- Property 'auth/saml_sp_entity_id' was added.
- Property 'auth/saml_time_tolerance' was added.
- Property 'auth/session_cookie_attributes' was added.
- Property 'auth/session_cookie_name' was added.
- Property 'auth/session_log_external_state' was added.
- Property 'auth/session_timeout' was added.
- Property 'auth/type' was added.
- Property 'auth/verbose' was added.

The following properties in 'Global Settings' (/api/tm/5.1/config/active/global_settings) have been added:

- Property 'auth/saml_key_lifetime' was added.
- Property 'auth/saml_key_rotation_interval' was added.

The following properties in 'Virtual servers' (/api/tm/5.1/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/auth_saml_redirects' was added.
- Property 'statistics/auth_saml_redirects_hi' was added.
- Property 'statistics/auth_saml_redirects_lo' was added.
- Property 'statistics/auth_saml_responses' was added.
- Property 'statistics/auth_saml_responses_accepted' was added.
- Property 'statistics/auth_saml_responses_accepted_hi' was added.
- Property 'statistics/auth_saml_responses_accepted_lo' was added.
- Property 'statistics/auth_saml_responses_hi' was added.
- Property 'statistics/auth_saml_responses_lo' was added.
- Property 'statistics/auth_saml_responses_rejected' was added.
- Property 'statistics/auth_saml_responses_rejected_hi' was added.
- Property 'statistics/auth_saml_responses_rejected_lo' was added.
- Property 'statistics/auth_sessions_created' was added.
- Property 'statistics/auth_sessions_created_hi' was added.
- Property 'statistics/auth_sessions_created_lo' was added.
- Property 'statistics/auth_sessions_rejected' was added.
- Property 'statistics/auth_sessions_rejected_hi' was added.
- Property 'statistics/auth_sessions_rejected_lo' was added.
- Property 'statistics/auth_sessions_used' was added.
- Property 'statistics/auth_sessions_used_hi' was added.
- Property 'statistics/auth_sessions_used_lo' was added.

Changes in Version 5.0

The following resources were added:

- Resource 'SSL Ticket Key' (/api/tm/5.0/config/active/ssl/ticket_keys)

The following properties in 'Pool' (/api/tm/5.0/config/active/pools) have been added:

- Property 'ssl/session_cache_enabled' was added.

The following properties in 'Traffic Manager' (/api/tm/5.0/config/active/traffic_managers) have been added:

- Property 'appliance/disable_cloud_init' was added.
- Property 'appliance/managereservedports' was added.
- Property 'appliance/manageservices' was added.

The following properties in 'Global Settings' (/api/tm/5.0/config/active/global_settings) have been added:

- Property 'ec2/metadata_server' was added.
- Property 'ec2/query_server' was added.
- Property 'ssl/cache_enabled' was added.
- Property 'ssl/client_cache_enabled' was added.
- Property 'ssl/client_cache_expiry' was added.
- Property 'ssl/client_cache_size' was added.
- Property 'ssl/client_cache_tickets_enabled' was added.
- Property 'ssl/tickets_enabled' was added.
- Property 'ssl/tickets_reissue_policy' was added.
- Property 'ssl/tickets_ticket_expiry' was added.
- Property 'ssl/tickets_ticket_key_expiry' was added.
- Property 'ssl/tickets_ticket_key_rotation' was added.
- Property 'ssl/tickets_time_tolerance' was added.

The following properties in 'Virtual Server' (/api/tm/5.0/config/active/virtual_servers) have been added:

- Property 'log/ssl_resumption_failures' was added.
- Property 'ssl/session_cache_enabled' was added.

- Property 'ssl/session_tickets_enabled' was added.

The following properties in 'Globals' (/api/tm/5.0/status/local_tm/statistics/globals) have been added:

- Property 'statistics/ssl_handshake_tlsv1' was added.
- Property 'statistics/ssl_handshake_tlsv11' was added.
- Property 'statistics/ssl_handshake_tlsv12' was added.

The following properties in 'Virtual servers' (/api/tm/5.0/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/ssl_cache_lookup' was added.
- Property 'statistics/ssl_cache_lookup_hi' was added.
- Property 'statistics/ssl_cache_lookup_lo' was added.
- Property 'statistics/ssl_cache_miss' was added.
- Property 'statistics/ssl_cache_miss_hi' was added.
- Property 'statistics/ssl_cache_miss_lo' was added.
- Property 'statistics/ssl_cache_rejected' was added.
- Property 'statistics/ssl_cache_rejected_hi' was added.
- Property 'statistics/ssl_cache_rejected_lo' was added.
- Property 'statistics/ssl_cache_resumed' was added.
- Property 'statistics/ssl_cache_resumed_hi' was added.
- Property 'statistics/ssl_cache_resumed_lo' was added.
- Property 'statistics/ssl_cache_saved' was added.
- Property 'statistics/ssl_cache_saved_hi' was added.
- Property 'statistics/ssl_cache_saved_lo' was added.
- Property 'statistics/ssl_new_session' was added.
- Property 'statistics/ssl_new_session_hi' was added.
- Property 'statistics/ssl_new_session_lo' was added.

- Property 'statistics/ssl_ticket_expired' was added.
- Property 'statistics/ssl_ticket_expired_hi' was added.
- Property 'statistics/ssl_ticket_expired_lo' was added.
- Property 'statistics/ssl_ticket_issued' was added.
- Property 'statistics/ssl_ticket_issued_hi' was added.
- Property 'statistics/ssl_ticket_issued_lo' was added.
- Property 'statistics/ssl_ticket_key_not_found' was added.
- Property 'statistics/ssl_ticket_key_not_found_hi' was added.
- Property 'statistics/ssl_ticket_key_not_found_lo' was added.
- Property 'statistics/ssl_ticket_received' was added.
- Property 'statistics/ssl_ticket_received_hi' was added.
- Property 'statistics/ssl_ticket_received_lo' was added.
- Property 'statistics/ssl_ticket_rejected' was added.
- Property 'statistics/ssl_ticket_rejected_hi' was added.
- Property 'statistics/ssl_ticket_rejected_lo' was added.
- Property 'statistics/ssl_ticket_resumed' was added.
- Property 'statistics/ssl_ticket_resumed_hi' was added.
- Property 'statistics/ssl_ticket_resumed_lo' was added.

The following properties in 'Pool' (/api/tm/5.0/config/active/pools) have been removed:

- Property 'ssl/ssl_support_ssl2' was removed.

The following properties in 'Traffic Manager' (/api/tm/5.0/config/active/traffic_managers) have been removed:

- Property 'appliance/force_hardware' was removed.
- Property 'appliance/shim_client_id' was removed.
- Property 'appliance/shim_client_key' was removed.

- Property 'appliance/shim_enabled' was removed.
- Property 'appliance/shim_ips' was removed.
- Property 'appliance/shim_load_balance' was removed.
- Property 'appliance/shim_log_level' was removed.
- Property 'appliance/shim_mode' was removed.
- Property 'appliance/shim_portal_url' was removed.
- Property 'appliance/shim_proxy_host' was removed.
- Property 'appliance/shim_proxy_port' was removed.

The following properties in 'Virtual Server' (/api/tm/5.0/config/active/virtual_servers) have been removed:

- Property 'ssl/prefer_sslv3' was removed.
- Property 'ssl/ssl_support_ssl2' was removed.

The following properties in 'Global Settings' (/api/tm/5.0/config/active/global_settings) have been removed:

- Property 'admin/support_ssl2' was removed.
- Property 'appliance/manage_ncipher' was removed.
- Property 'appliance/nethsm_esn' was removed.
- Property 'appliance/nethsm_hash' was removed.
- Property 'appliance/nethsm_ip' was removed.
- Property 'appliance/nethsm_ncipher_rfs' was removed.
- Property 'ssl/support_ssl2' was removed.
- Property 'trafficscript/array_elements' was removed.

The following properties in 'Globals' (/api/tm/5.0/status/local_tm/statistics/globals) have been removed:

- Property 'statistics/ssl_handshake_t_l_sv1' was removed.

- Property 'statistics/ssl_handshake_t_l_sv11' was removed.
- Property 'statistics/ssl_handshake_t_l_sv12' was removed.

The following properties in 'Alerting Action' (/api/tm/5.0/config/active/actions) have been renamed:

- Property 'log/from' was renamed to 'email/from'.

The following properties in 'Protection Class' (/api/tm/5.0/config/active/protection) have been renamed:

- Property 'basic/per_process_connection_count' was renamed to 'concurrent_connections/per_process_connection_count'.
- Property 'connection_limiting/max_10_connections' was renamed to 'concurrent_connections/max_10_connections'.
- Property 'connection_limiting/max_1_connections' was renamed to 'concurrent_connections/max_1_connections'.
- Property 'connection_limiting/max_connection_rate' was renamed to 'connection_rate/max_connection_rate'.
- Property 'connection_limiting/min_connections' was renamed to 'concurrent_connections/min_connections'.
- Property 'connection_limiting/rate_timer' was renamed to 'connection_rate/rate_timer'.

The following properties in 'Virtual Server' (/api/tm/5.0/config/active/virtual_servers) have been renamed:

- Property 'basic/add_cluster_ip' was renamed to 'http/add_cluster_ip'.
- Property 'basic/add_x_forwarded_for' was renamed to 'http/add_x_forwarded_for'.
- Property 'basic/add_x_forwarded_proto' was renamed to 'http/add_x_forwarded_proto'.
- Property 'basic/auto_upgrade_protocols' was renamed to 'http/auto_upgrade_protocols'.
- Property 'basic/autodetect_upgrade_headers' was renamed to 'http/autodetect_upgrade_headers'.
- Property 'basic/close_with_rst' was renamed to 'tcp/close_with_rst'.
- Property 'basic/completionrules' was renamed to 'basic/completion_rules'.

- Property 'basic/ftp_force_server_secure' was renamed to 'ftp/force_server_secure'.
- Property 'basic/mss' was renamed to 'tcp/mss'.
- Property 'basic/so_nagle' was renamed to 'tcp/nagle'.
- Property 'basic/ssl_client_cert_headers' was renamed to 'ssl/client_cert_headers'.
- Property 'basic/ssl_honor_fallback_scsv' was renamed to 'ssl/honor_fallback_scsv'.
- Property 'basic/strip_x_forwarded_proto' was renamed to 'http/strip_x_forwarded_proto'.
- Property 'basic/udp_end_transaction' was renamed to 'udp/udp_end_transaction'.
- Property 'ssl/ssl_ciphers' was renamed to 'ssl/cipher_suites'.
- Property 'ssl/ssl_support_ssl3' was renamed to 'ssl/support_ssl3'.
- Property 'ssl/ssl_support_tls1' was renamed to 'ssl/support_tls1'.
- Property 'ssl/ssl_support_tls1_1' was renamed to 'ssl/support_tls1_1'.
- Property 'ssl/ssl_support_tls1_2' was renamed to 'ssl/support_tls1_2'.

The following properties in 'Global Settings' (/api/tm/5.0/config/active/global_settings) have been renamed:

- Property 'admin/support_tls11' was renamed to 'admin/support_tls1_1'.
- Property 'admin/support_tls12' was renamed to 'admin/support_tls1_2'.
- Property 'ospfv2/router_dead_interval' was renamed to 'ospfv2/dead_interval'.
- Property 'ssl/ssl3_allow_rehandshake' was renamed to 'ssl/allow_rehandshake'.
- Property 'ssl/ssl3_ciphers' was renamed to 'ssl/cipher_suites'.
- Property 'ssl/ssl3_diffie_hellman_client_min_key_length' was renamed to 'ssl/diffie_hellman_client_min_modulus_size'.
- Property 'ssl/ssl3_diffie_hellman_key_length' was renamed to 'ssl/diffie_hellman_modulus_size'.
- Property 'ssl/ssl3_min_rehandshake_interval' was renamed to 'ssl/min_rehandshake_interval'.

The following properties in 'Pool' (/api/tm/5.0/config/active/pools) have been renamed:

- Property 'ssl/ssl_ciphers' was renamed to 'ssl/cipher_suites'.

- Property 'ssl/ssl_support_ssl3' was renamed to 'ssl/support_ssl3'.
- Property 'ssl/ssl_support_tls1' was renamed to 'ssl/support_tls1'.
- Property 'ssl/ssl_support_tls1_1' was renamed to 'ssl/support_tls1_1'.
- Property 'ssl/ssl_support_tls1_2' was renamed to 'ssl/support_tls1_2'.

The following properties for 'Global Settings' (/api/tm/5.0/config/active/global_settings) have had flags change:

- Property 'ssl/min_rehandshake_interval' has had the following flags removed: [LOCATION_IGNORE]

Changes in Version 4.0

The following resources were added:

- Resource 'Log Export' (/api/tm/4.0/config/active/log_export)

The following properties in 'Global Settings' (/api/tm/4.0/config/active/global_settings) have been added:

- Property 'log_export/auth_hec_token' was added.
- Property 'log_export/auth_http' was added.
- Property 'log_export/auth_password' was added.
- Property 'log_export/auth_username' was added.
- Property 'log_export/enabled' was added.
- Property 'log_export/endpoint' was added.
- Property 'log_export/max_event_message_size' was added.
- Property 'log_export/max_request_bandwidth' was added.
- Property 'log_export/max_request_size' was added.
- Property 'log_export/max_response_size' was added.
- Property 'log_export/maximum_error_raising_period' was added.
- Property 'log_export/minimum_error_raising_period' was added.

- Property 'log_export/request_timeout' was added.
- Property 'log_export/tls_verify' was added.
- Property 'transaction_export/auto_brief' was added.
- Property 'transaction_export/enabled' was added.
- Property 'transaction_export/endpoint' was added.
- Property 'transaction_export/failure_interval' was added.
- Property 'transaction_export/memory' was added.
- Property 'transaction_export/reconnect_interval' was added.
- Property 'transaction_export/tls' was added.
- Property 'transaction_export/tls_timeout' was added.
- Property 'transaction_export/tls_verify' was added.

The following properties in 'Bandwidth' (/api/tm/4.0/status/local_tm/statistics/bandwidth/*) have been added:

- Property 'statistics/bytes_drop' was added.
- Property 'statistics/bytes_drop_hi' was added.
- Property 'statistics/bytes_drop_lo' was added.
- Property 'statistics/pkts_drop' was added.
- Property 'statistics/pkts_drop_hi' was added.
- Property 'statistics/pkts_drop_lo' was added.

The following properties in 'Virtual servers' (/api/tm/4.0/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/bw_limit_bytes_drop' was added.
- Property 'statistics/bw_limit_bytes_drop_hi' was added.
- Property 'statistics/bw_limit_bytes_drop_lo' was added.
- Property 'statistics/bw_limit_pkts_drop' was added.

- Property 'statistics/bw_limit_pkts_drop_hi' was added.
- Property 'statistics/bw_limit_pkts_drop_lo' was added.
- Property 'statistics/pkts_in' was added.
- Property 'statistics/pkts_in_hi' was added.
- Property 'statistics/pkts_in_lo' was added.
- Property 'statistics/pkts_out' was added.
- Property 'statistics/pkts_out_hi' was added.
- Property 'statistics/pkts_out_lo' was added.

The following properties in 'Pools' (/api/tm/4.0/status/local_tm/statistics/pools/*) have been added:

- Property 'statistics/bw_limit_bytes_drop' was added.
- Property 'statistics/bw_limit_bytes_drop_hi' was added.
- Property 'statistics/bw_limit_bytes_drop_lo' was added.
- Property 'statistics/bw_limit_pkts_drop' was added.
- Property 'statistics/bw_limit_pkts_drop_hi' was added.
- Property 'statistics/bw_limit_pkts_drop_lo' was added.

The following properties in 'Per pool node' (/api/tm/4.0/status/local_tm/statistics/nodes/per_pool_node/*) have been added:

- Property 'statistics/l4_stateless_buckets' was added.
- Property 'statistics/pkts_from_node' was added.
- Property 'statistics/pkts_from_node_hi' was added.
- Property 'statistics/pkts_from_node_lo' was added.
- Property 'statistics/pkts_to_node' was added.
- Property 'statistics/pkts_to_node_hi' was added.
- Property 'statistics/pkts_to_node_lo' was added.

The following properties in 'Globals' (/api/tm/4.0/status/local_tm/statistics/globals) have been added:

- Property 'statistics/analytics_transactions_dropped' was added.
- Property 'statistics/analytics_transactions_exported' was added.
- Property 'statistics/analytics_transactions_memory_usage' was added.

The following properties in 'Virtual Server' (/api/tm/4.0/config/active/virtual_servers) have been added:

- Property 'basic/strip_x_forwarded_proto' was added.
- Property 'transaction_export/brief' was added.
- Property 'transaction_export/enabled' was added.
- Property 'transaction_export/hi_res' was added.
- Property 'transaction_export/http_header_blacklist' was added.

Changes in Version 3.11

The following properties in 'Global Settings' (/api/tm/3.11/config/active/global_settings) have been added:

- Property 'fault_tolerance/autofailback_delay' was added.
- Property 'rest_api/block_for_future_max' was added.
- Property 'rest_api/http_compress_min' was added.
- Property 'rest_api/http_keep_alive_timeout' was added.
- Property 'rest_api/http_max_resource_body_length' was added.
- Property 'rest_api/http_max_write_buffer' was added.
- Property 'rest_api/http_session_timeout' was added.

The following properties in 'Virtual Server' (/api/tm/3.11/config/active/virtual_servers) have been added:

- Property 'basic/proxy_protocol' was added.
- Property 'ssl/issued_certs_never_expire_depth' was added.

The following properties in 'State' (/api/tm/3.11/status/local_tm/state) have been added:

- Property 'state/pools' was added.

- Table property 'state/virtual_servers' field 'ts_redirect_pools' was added.

The following properties in 'Traffic Manager' (/api/tm/3.11/config/active/traffic_managers) have been added:

- Property 'fault_tolerance/lss_dedicated_ips' was added.
- Table property 'appliance/if' field 'mode' was added.

The type of the following properties in 'State' (/api/tm/3.11/status/local_tm/state) has changed:

- Table property 'state/virtual_servers' field 'throughput' changed type from 'Unsigned integer' to 'Unsigned integer 64'.

The following properties for 'Global Settings' (/api/tm/3.11/config/active/global_settings) have had flags change:

- Property 'data_plane_acceleration/tcp_delay_ack' has had the following flags added:
[RESTART_SOFTWARE]
- Property 'data_plane_acceleration/tcp_win_scale' has had the following flags added:
[RESTART_SOFTWARE]

Changes in Version 3.10

The following properties in 'Monitor' (/api/tm/3.10/config/active/monitors) have been added:

- Property 'basic/factory' was added.
- Property 'basic/health_only' was added.

The following properties in 'Traffic Manager' (/api/tm/3.10/config/active/traffic_managers) have been added:

- Property 'basic/developer_mode_accepted' was added.

The following properties in 'Virtual Server' (/api/tm/3.10/config/active/virtual_servers) have been added:

- Property 'basic/max_concurrent_connections' was added.
- Property 'basic/rules_on_connect' was added.
- Property 'basic/udp_end_transaction' was added.

- Property 'gzip/chunk' was added.
- Property 'http2/headers_size_limit' was added.
- Property 'l4accel/service_ip_snat' was added.
- Property 'l4stateless/initial_ring_size' was added.
- Property 'l4stateless/num_replicas' was added.

The following properties in 'Protection Class' (/api/tm/3.10/config/active/protection) have been added:

- Property 'basic/linger_time' was added.

The following properties in 'Global Settings' (/api/tm/3.10/config/active/global_settings) have been added:

- Property 'data_plane_acceleration/tcp_delay_ack' was added.
- Property 'data_plane_acceleration/tcp_win_scale' was added.
- Property 'ec2/awstool_timeout' was added.
- Property 'ec2/metadata_timeout' was added.
- Property 'l4accel/max_concurrent_connections' was added.
- Property 'remote_licensing/owner' was added.
- Property 'remote_licensing/owner_secret' was added.
- Property 'remote_licensing/policy_id' was added.

Changes in Version 3.9

The following resources were added:

- Resource 'Backups' (/api/tm/3.9/status/local_tm/backups/full/*)

The following properties in 'Virtual Server' (/api/tm/3.9/config/active/virtual_servers) have been added:

- Property 'basic/bypass_data_plane_acceleration' was added.
- Property 'l4accel/rst_on_service_failure' was added.
- Property 'l4accel/state_sync' was added.

- Property 'l4accel/tcp_msl' was added.
- Property 'l4accel/timeout' was added.
- Property 'l4accel/udp_count_requests' was added.
- Property 'ssl/max_key_size' was added.
- Property 'ssl/min_key_size' was added.

The following properties in 'Traffic Manager' (/api/tm/3.9/config/active/traffic_managers) have been added:

- Property 'appliance/managedpa' was added.
- Property 'basic/num_l4_children' was added.
- Property 'basic/num_l7_children' was added.
- Property 'iop/is_standalone' was added.
- Property 'iop/l4_event_driven_mode' was added.
- Property 'iop/l7_event_driven_mode' was added.
- Property 'iop/linux_interface' was added.
- Property 'iop/num_mbufs_per_mpool' was added.
- Property 'iop/send_to_linux' was added.

The following properties in 'Traffic IP Group' (/api/tm/3.9/config/active/traffic_ip_groups) have been added:

- Property 'basic/snat_ipaddresses' was added.

The following properties in 'Pool' (/api/tm/3.9/config/active/pools) have been added:

- Property 'l4accel/snat' was added.

The following properties in 'Global Settings' (/api/tm/3.9/config/active/global_settings) have been added:

- Property 'basic/data_plane_acceleration_cores' was added.
- Property 'basic/data_plane_acceleration_mode' was added.

- Property 'fault_tolerance/l4accel_child_timeout' was added.
- Property 'fault_tolerance/l4accel_sync_port' was added.
- Property 'source_nat/clist_locks' was added.
- Property 'source_nat/ip_limit' was added.
- Property 'source_nat/ip_local_port_range_high' was added.
- Property 'source_nat/portmaphashtable_locks' was added.
- Property 'source_nat/shared_pool_size' was added.

The following properties in 'Virtual servers' (/api/tm/3.9/status/local_tm/statistics/virtual_servers/*) have been added:

- Property 'statistics/total_tcp_reset' was added.
- Property 'statistics/total_udp_unreachables' was added.

The following properties in 'Session Persistence Class' (/api/tm/3.9/config/active/persistence) have been added:

- Property 'basic/subnet_mask_len_v4' was added.
- Property 'basic/subnet_mask_len_v6' was added.

The following properties for 'Pool' (/api/tm/3.9/config/active/pools) have had flags change:

- Property 'ssl/ssl_support_ssl2' has had the following flags added: [SOAP_IGNORE]

The following properties for 'Global Settings' (/api/tm/3.9/config/active/global_settings) have had flags change:

- Property 'admin/support_ssl2' has had the following flags added: [SOAP_IGNORE]
- Property 'ssl/support_ssl2' has had the following flags added: [SOAP_IGNORE]

The following properties for 'Virtual Server' (/api/tm/3.9/config/active/virtual_servers) have had flags change:

- Property 'ssl/ssl_support_ssl2' has had the following flags added: [SOAP_IGNORE]

Changes in Version 3.8

The following properties in 'Virtual Server' (/api/tm/3.8/config/active/virtual_servers) have been added:

- Property 'log/always_flush' was added.
- Property 'ssl/server_cert_alt_certificates' was added.
- Table property 'ssl/server_cert_host_mapping' field 'alt_certificates' was added.

The following properties in 'Pool' (/api/tm/3.8/config/active/pools) have been added:

- Property 'basic/lard_size' was added.
- Property 'udp/response_timeout' was added.

The following properties in 'Event Type' (/api/tm/3.8/config/active/event_types) have been added:

- Property 'basic/log2mainlog' was added.

The following properties in 'Traffic Manager' (/api/tm/3.8/config/active/traffic_managers) have been added:

- Property 'basic/use_mx' was added.
- Property 'remote_licensing/email_address' was added.
- Property 'remote_licensing/message' was added.

The following properties in 'Globals' (/api/tm/3.8/status/local_tm/statistics/globals) have been added:

- Property 'statistics/ssl_cipher_ecdsa_signs' was added.
- Property 'statistics/ssl_cipher_ecdsa_verifies' was added.

The following properties in 'Global Settings' (/api/tm/3.8/config/active/global_settings) have been added:

- Property 'dns/checktime' was added.
- Property 'dns/hosts' was added.
- Property 'dns/hostsfirst' was added.
- Property 'dns/maxasynctries' was added.
- Property 'dns/resolv' was added.

- Property 'fault_tolerance/child_timeout' was added.
- Property 'http/max_chunk_header_length' was added.
- Property 'remote_licensing/registration_server' was added.
- Property 'remote_licensing/script_timeout' was added.
- Property 'remote_licensing/server_certificate' was added.
- Property 'ssl_hardware/nworkers' was added.
- Property 'ssl_hardware/queue_len' was added.
- Property 'web_cache/blocksize' was added.
- Property 'web_cache/max_byte_range_segments' was added.
- Property 'web_cache/min_size_accept_range' was added.

Changes in Version 3.7

The following resources were added:

- Resource 'State' (/api/tm/3.7/status/local_tm/state)

The following properties in 'Virtual Server' (/api/tm/3.7/config/active/virtual_servers) have been added:

- Property 'basic/mss' was added.

The following properties in 'Traffic IP Group' (/api/tm/3.7/config/active/traffic_ip_groups) have been added:

- Property 'basic/ip_assignment_mode' was added.

The following properties in 'Traffic Manager' (/api/tm/3.7/config/active/traffic_managers) have been added:

- Property 'appliance/ipmi_lan_access' was added.
- Property 'appliance/ipmi_lan_addr' was added.
- Property 'appliance/ipmi_lan_gateway' was added.
- Property 'appliance/ipmi_lan_ipsrc' was added.
- Property 'appliance/ipmi_lan_mask' was added.

- Property 'basic/appliance_card' was added.

Changes in Version 3.6

The following properties in 'Traffic Manager' (/api/tm/3.6/config/active/traffic_managers) have been added:

- Property 'appliance/ipv6_forwarding' was added.
- Property 'appliance/ssh_password_allowed' was added.

The following properties in 'Virtual Server' (/api/tm/3.6/config/active/virtual_servers) have been added:

- Property 'dns/edns_client_subnet' was added.
- Property 'http2/connect_timeout' was added.
- Property 'http2/data_frame_size' was added.
- Property 'http2/enabled' was added.
- Property 'http2/header_table_size' was added.
- Property 'http2/idle_timeout_no_streams' was added.
- Property 'http2/idle_timeout_open_streams' was added.
- Property 'http2/max_concurrent_streams' was added.
- Property 'http2/max_frame_size' was added.
- Property 'http2/max_header_padding' was added.
- Property 'http2/neverindex_blacklist' was added.
- Property 'http2/neverindex_default' was added.
- Property 'http2/neverindex_whitelist' was added.
- Property 'http2/stream_window_size' was added.

The following properties in 'Global Settings' (/api/tm/3.6/config/active/global_settings) have been added:

- Property 'auditlog/via_eventd' was added.
- Property 'basic/cluster_identifier' was added.

- Property 'basic/http2_no_cipher_blacklist_check' was added.
- Property 'web_cache/max_handles' was added.

Changes in Version 3.5

The following resources were added:

- Resource 'BGP Neighbor' (/api/tm/3.5/config/active/bgpneighbors)

The following properties in 'Virtual Server' (/api/tm/3.5/config/active/virtual_servers) have been added:

- Property 'basic/auto_upgrade_protocols' was added.
- Property 'basic/autodetect_upgrade_headers' was added.
- Property 'basic/transparent' was added.

The following properties in 'Traffic Manager' (/api/tm/3.5/config/active/traffic_managers) have been added:

- Property 'fault_tolerance/bgp_router_id' was added.
- Property 'iptables/config_enabled' was added.
- Property 'iptrans/chain' was added.
- Property 'iptrans/fwmark' was added.
- Property 'iptrans/iptables_enabled' was added.
- Property 'iptrans/routing_table' was added.

The following properties in 'Information' (/api/tm/3.5/status/local_tm/information) have been added:

- Property 'information/uuid' was added.

The following properties in 'Pool' (/api/tm/3.5/config/active/pools) have been added:

- Property 'basic/node_delete_behavior' was added.
- Property 'basic/node_drain_to_delete_timeout' was added.

The following properties in 'Monitor' (/api/tm/3.5/config/active/monitors) have been added:

- Property 'basic/can_edit_ssl' was added.

- Property 'basic/can_use_ssl' was added.
- Property 'basic/editable_keys' was added.

The following properties in 'Traffic IP Group' (/api/tm/3.5/config/active/traffic_ip_groups) have been added:

- Property 'basic/rhi_bgp_metric_base' was added.
- Property 'basic/rhi_bgp_passive_metric_offset' was added.
- Property 'basic/rhi_protocols' was added.

The following properties in 'Global Settings' (/api/tm/3.5/config/active/global_settings) have been added:

- Property 'basic/license_servers' was added.
- Property 'bgp/as_number' was added.
- Property 'bgp/enabled' was added.
- Property 'ssl/ssl3_diffie_hellman_client_min_key_length' was added.

The following properties in 'Security Settings' (/api/tm/3.5/config/active/security) have been added:

- Property 'ssh_intrusion/bantime' was added.
- Property 'ssh_intrusion/blacklist' was added.
- Property 'ssh_intrusion/enabled' was added.
- Property 'ssh_intrusion/findtime' was added.
- Property 'ssh_intrusion/maxretry' was added.
- Property 'ssh_intrusion/whitelist' was added.

The following properties for 'Virtual Server' (/api/tm/3.5/config/active/virtual_servers) have had flags change:

- Property 'basic/glb_services' has had the following flags removed: [SOAP_IGNORE]

Changes in Version 3.4

The following properties in 'Web cache' (/api/tm/3.4/status/local_tm/statistics/cache/web_cache) have been added:

- Property 'statistics/url_store_allocated' was added.
- Property 'statistics/url_store_free' was added.
- Property 'statistics/url_store_size' was added.
- Property 'statistics/url_store_total_allocations' was added.
- Property 'statistics/url_store_total_failures' was added.
- Property 'statistics/url_store_total_frees' was added.

The following properties in 'Pool' (/api/tm/3.4/config/active/pools) have been added:

- Property 'auto_scaling/addnode_delaytime' was added.
- Property 'ssl/common_name_match' was added.
- Property 'ssl/elliptic_curves' was added.

The following properties in 'GLB Service' (/api/tm/3.4/config/active/glb_services) have been added:

- Property 'basic/peer_health_timeout' was added.

The following properties in 'Virtual Server' (/api/tm/3.4/config/active/virtual_servers) have been added:

- Property 'dns/rrset_order' was added.
- Property 'gzip/etag_rewrite' was added.
- Property 'ssl/elliptic_curves' was added.

The following properties in 'Globals' (/api/tm/3.4/status/local_tm/statistics/globals) have been added:

- Property 'statistics/ssl_cipher_ecdh_agreements' was added.
- Property 'statistics/ssl_cipher_ecdh_generates' was added.

The following properties in 'Global Settings' (/api/tm/3.4/config/active/global_settings) have been added:

- Property 'admin/ssl_elliptic_curves' was added.

- Property 'auditlog/via_syslog' was added.
- Property 'ssl/elliptic_curves' was added.
- Property 'ssl_hardware/azure_api_version' was added.
- Property 'ssl_hardware/azure_client_id' was added.
- Property 'ssl_hardware/azure_client_secret' was added.
- Property 'ssl_hardware/azure_connect_timeout' was added.
- Property 'ssl_hardware/azure_idle_timeout' was added.
- Property 'ssl_hardware/azure_vault_url' was added.
- Property 'ssl_hardware/azure_verify_rest_api_cert' was added.
- Property 'web_cache/url_store_keep_free' was added.
- Property 'web_cache/url_store_max_mallocs' was added.
- Property 'web_cache/url_store_num_bins' was added.

The following properties in 'Traffic Manager' (/api/tm/3.4/config/active/traffic_managers) have been added:

- Property 'appliance/manageazureroutes' was added.

Changes in Version 3.3

The following resources were added:

- Resource 'DNS Zone File' (/api/tm/3.3/config/active/dns_server/zone_files)
- Resource 'DNS Zone' (/api/tm/3.3/config/active/dns_server/zones)

The following properties in 'Global Settings' (/api/tm/3.3/config/active/global_settings) have been added:

- Property 'admin/honor_fallback_scsv' was added.
- Property 'ssl/honor_fallback_scsv' was added.

The following properties in 'Globals' (/api/tm/3.3/status/local_tm/statistics/globals) have been added:

- Property 'statistics/ssl_cipher_aes_gcm_decrypts' was added.

- Property 'statistics/ssl_cipher_aes_gcm_encrypts' was added.

The following properties in 'Traffic Manager' (/api/tm/3.3/config/active/traffic_managers) have been added:

- Property 'autodiscover/product_id' was added.
- Property 'basic/kmod_policy' was added.
- Property 'basic/start_sysd' was added.

The following properties in 'Virtual Server' (/api/tm/3.3/config/active/virtual_servers) have been added:

- Property 'basic/ssl_honor_fallback_scsv' was added.
- Property 'dns/verbose' was added.
- Property 'dns/zones' was added.

The following properties in 'GLB Service' (/api/tm/3.3/config/active/glb_services) have been added:

- Property 'basic/autorecovery' was added.
- Property 'basic/disable_on_failure' was added.
- Property 'basic/last_resort_response' was added.

The following properties for 'Virtual Server' (/api/tm/3.3/config/active/virtual_servers) have had flags change:

- Property 'dns/edns_udpsize' has had the following flags removed: [SOAP_IGNORE]
- Property 'dns/max_udpsize' has had the following flags removed: [SOAP_IGNORE]
- Property 'ssl/prefer_sslv3' has had the following flags added: [SOAP_IGNORE]

Changes in Version 3.2

The following properties in "Pool" (/api/tm/3.2/config/active/pools) have been added:

- "Property "ssl/signature_algorithms" was added.
- "Property "ssl/ssl_support_tls1_2" was added.

The following properties in "Virtual servers" (/api/tm/3.2/status/local_tm/statistics/virtual_servers/*) have been added:

- "Property "statistics/max_duration_timed_out" was added.
- "Property "statistics/processing_timed_out" was added.

The following properties in "Globals" (/api/tm/3.2/status/local_tm/statistics/globals) have been added:

- "Property "statistics/ssl_cipher_dh_agreements" was added.
- "Property "statistics/ssl_cipher_dh_generates" was added.
- "Property "statistics/ssl_cipher_dsa_signs" was added.
- "Property "statistics/ssl_cipher_dsa_verifies" was added.
- "Property "statistics/ssl_handshake_t_l_sv12" was added.

The following properties in "Traffic Manager" (/api/tm/3.2/config/active/traffic_managers) have been added:

- "Property "basic/adminMasterXMLIP" was added.
- "Property "basic/adminSlaveXMLIP" was added.
- "Property "basic/authenticationServerIP" was added.
- "Property "basic/updaterIP" was added.
- "Property "ec2/trafficips_public_enis" was added.

The following properties in "Global Settings" (/api/tm/3.2/config/active/global_settings) have been added:

- "Property "admin/ssl_signature_algorithms" was added.
- "Property "admin/support_tls12" was added.
- "Property "aptimizer/max_concurrent_jobs" was added.
- "Property "ec2/action_timeout" was added.
- "Property "ssl/signature_algorithms" was added.
- "Property "ssl/support_tls1_2" was added.

The following properties in "Virtual Server" (/api/tm/3.2/config/active/virtual_servers) have been added:

- "Property "dns/edns_udpsize" was added.

- "Property "dns/max_udpsize" was added.
- "Property "ssl/signature_algorithms" was added.
- "Property "ssl/ssl_support_tls1_2" was added.

The following properties in "Rules" (/api/tm/3.2/status/local_tm/statistics/rules/*) have been added:

- "Property "statistics/execution_time_warnings" was added.

Changes in Version 3.1

The following resources were added:

- Resource "User counters 32" (/api/tm/3.1/status/local_tm/statistics/extras/user_counters_32)
- Resource "User counters 64" (/api/tm/3.1/status/local_tm/statistics/extras/user_counters_64)

The following properties in "Global Settings" (/api/tm/3.1/config/active/global_settings) have been added:

- Property "ec2/verify_query_server_cert" was added.
- Property "fault_tolerance/igmp_interval" was added.
- Property "ssl/cache_per_virtualserver" was added.
- Property "ssl/ocsp_max_response_size" was added.
- Property "trafficscript/execution_time_warning" was added.

The following properties in "Virtual Server" (/api/tm/3.1/config/active/virtual_servers) have been added:

- Property "basic/close_with_rst" was added.
- Property "log/session_persistence_verbose" was added.

The following properties in "Pool" (/api/tm/3.1/config/active/pools) have been added:

- Property "basic/node_close_with_rst" was added.

The following properties in "Traffic Manager" (/api/tm/3.1/config/active/traffic_managers) have been added:

- Property "basic/cloud_platform" was added.
- Property "basic/disk_serious" was added.

- Property "basic/disk_warn" was added

Changes in Version 3.0

The Traffic Manager REST representation of pool nodes has changed for this release. All nodes and related properties are now contained within a single table (`nodes_table`). For more information, see the Pool configuration resource in the "Resource Model Reference" chapter of the *REST API Guide* for Stingray Traffic Manager release 9.6.

The following resources were added:

- Resource 'NAT Configuration' (/api/tm/3.0/config/active/appliance/nat)

The following properties in 'Global Settings' (/api/tm/3.0/config/active/global_settings) have been added:

- Property 'autoscaler/slm_interval' was added.
- Property 'autoscaler/verbose' was added.
- Property 'fault_tolerance/tipv6_raise_deprecated' was added.
- Property 'ssl/disable_stitched_cbc_hmac' was added.
- Property 'ssl/ocsp_stapling_maximum_refresh_interval' was added.
- Property 'ssl/ocsp_stapling_time_tolerance' was added.
- Property 'ssl/ocsp_stapling_verify_response' was added.

The following properties in 'Pool' (/api/tm/3.0/config/active/pools) have been added:

- Property 'auto_scaling/extraargs' was added.
- Property 'auto_scaling/securitygroupids' was added.
- Property 'auto_scaling/subnetids' was added.
- Property 'basic/nodes_table' was added.
- Property 'ssl/ssl_ciphers' was added.
- Property 'ssl/ssl_support_ssl2' was added.
- Property 'ssl/ssl_support_ssl3' was added.

- Property 'ssl/ssl_support_tls1' was added.
- Property 'ssl/ssl_support_tls1_1' was added.

The following properties in 'Traffic Manager' (/api/tm/3.0/config/active/traffic_managers) have been added:

- Property 'appliance/ipv4_forwarding' was added.

The following properties in 'Virtual Server' (/api/tm/3.0/config/active/virtual_servers) have been added:

- Property 'basic/completionrules' was added.
- Property 'connection/max_transaction_duration' was added.
- Property 'log/save_all' was added.
- Property 'recent_connections/enabled' was added.
- Property 'recent_connections/save_all' was added.
- Property 'ssl/ssl_ciphers' was added.
- Property 'ssl/ssl_support_ssl2' was added.
- Property 'ssl/ssl_support_ssl3' was added.
- Property 'ssl/ssl_support_tls1' was added.
- Property 'ssl/ssl_support_tls1_1' was added.

The following properties in 'Pool' (/api/tm/3.0/config/active/pools) have been removed:

- Property 'basic/disabled' was removed.
- Property 'basic/draining' was removed.
- Property 'basic/nodes' was removed.
- Property 'load_balancing/node_weighting' was removed.
- Property 'load_balancing/priority_values' was removed.
